VOL. LXXIII NEW YORK, THURSDAY, JULY 4, 1912 No. 3318

Survey of the World

The Democratic National Convention

At the beginning of the Democratic National Convention in Baltimore, on the 25th ult., William J. Bryan strenuously opposed the election of Alton B. Parker to be temporary chairman. He had urged delegates to prevent the election of Judge Parker, saying the latter was the most conspicuous representative of the reactionary element of the party, and that, having the financial support of Thomas F. Ryan and August Belmont in 1904, he had received 1,250,000 less votes than had been given to the Democratic ticket four years earlier. In the national committee, 31 had voted for Parker and 20 for Ollie M. James, of Kentucky. Before the convention assembled, Mr. Bryan published a statement, repeating his argument against Parker and saying a majority of the members of the committee were slavishly under the control of the predatory interests which had nominated Taft at Chicago. At the opening session he nominated Senator Kern, of Indiana, asserting that Parker had refused to withdraw for the sake of harmony. Mr. Kern, addressing the convention, declined the nomination and asked Parker to join him in naming Senator O'Gorman for the office. Failing in this, the Indiana Senator nominated Mr. Bryan, but Judge Parker was elected by a vote of 579 to 510. Mr. Bryan had referred to the forces behind Parker, and had deplored the opening of the convention by a paralyzing speech from such a man. About half of Judge Parker's address was an attack upon the Republican "brawl" at Chicago. The remainder was satisfactory Democratic doctrine about the tariff, Trusts and the "corrupt alliance" of the Republican party with special privilege. He sought to conciliate Mr. Bryan, suggesting that the latter should be made chairman of the platform committee. On the following day Mr. Bryan declined that office, saying he desired to be free to support a minority report, if there should be one. A short session on the second day was given up to political speeches, but at a second session the convention decided that adoption of the platform should follow the nomination of a ticket. It also abrogated the unit rule under certain conditions, adopting a minority report from the committee on rules. There was a vigorous debate, the contest relating especially to Ohio's delegation, where the unit rule would hold for Governor Harmon nineteen Wilson delegates elected by Congressional districts. The minority report, approved by a vote of 565½ to 495½, excepted from the operation of the rule such delegates as had been elected in districts under a State primary law. This decision was favorable to Governor Wilson. Ollie M. James, Senator-elect from Kentucky, was elected permanent chairman without opposition. His address was radically Democratic, and in it he commended Mr. Bryan. At the night session on the third day, when the nominating speeches were about to be made, Mr. Bryan caused a sensation by introducing the following resolutions:

"*Resolved*, That in this crisis in our party's career and in our country's history, this convention sends greeting to the people of the United States and assures them that the party of Jefferson and of Jackson is still the champion of popular government and of equality

before the law. As proof of our fidelity to the people, we hereby declare ourselves opposed to the nomination of any candidate for President who is the representative of, or is under any obligation to, J. Pierpont Morgan, Thomas F. Ryan, August Belmont, or any other member of the privilege-hunting and favor-seeking class.

"*Resolved*, That we demand the withdrawal from this convention of any delegate or delegates constituting or representing the above-named interests."

Mr. Ryan was a delegate from Virginia and Mr. Belmont a delegate from New York. Mr. Bryan asked unanimous consent for action upon the resolutions. There was a bitter debate. He said the three men named were connected with the merciless and despotic Money Trust. Two of them were in Baltimore with their paid attorneys, and there was a plan on foot to sell the Democratic party into bondage to the predatory interests —a most brazen, insolent and impudent attempt to enslave the American people. There were sharp responses to his remarks. Some cried, "Go over to Roosevelt!" Mr. Bryan said he would withdraw the second resolution if the Virginia and New York delegations should ask him to do so. There was no action in the New York delegation, but he was informed that Virginia desired withdrawal. The second resolution having been laid aside, the first one was adopted by a vote of 889 to 196. Some voted against it at first and then changed their attitude. The several candidates were then formally commended to the convention in long speeches. On the first ballot, Friday evening, the figures were as follows: Clark, 441½; Wilson, 324; Harmon, 148; Underwood, 117½; Marshall, 31; Baldwin, 22; Sulzer, 2; Bryan, 1. Twelve ballots were taken before adjournment (at 3.05 a. m.) and until the tenth there was little change. On that ballot the votes of New York were shifted to Clark from Harmon, the latter falling to 31, while Clark's total rose to 556. On Saturday the convention balloted for eleven hours, and the roll was called fourteen times. On the twenty-sixth ballot, Clark had fallen to 463½ and Wilson's total had grown to 407½, while 112½ were counted for Underwood. After the twenty-sixth ballot the convention adjourned until Monday. On Monday afternoon Wilson was leading the poll, and had 29 of Indiana's 30 votes. Mr. Bryan on Saturday evening made a sensational speech explaining his vote. He withheld his vote from Clark so long as New York's vote should be recorded for him. He would take the same position with respect to any other candidate. There was much disorder. Mr. Bryan was asked whether he would support a ticket nominated by the aid of New York's votes. Some thought his answer was evasive. He finally said, however, that he expected to support the nominees of the convention and did not expect to see any one nominated who would permit himself to be a partner of Morgan, Ryan and Belmont. On Sunday there were conferences, but the deadlock seemed firmly held. Mr. Clark quarreled with Mr. Bryan. The latter suggested as candidates in support of any one of whom a compromise might satisfactorily be reached: Senator Kern, of Indiana; Senator-elect James, of Kentucky; and Senators Culberson, of Texas, Rayner, of Maryland, and O'Gorman, of New York.

The Republican Bolters

There were indications last week that Mr. Roosevelt and his political supporters were waiting for the final action of the Democratic convention. But they were not idle. There were several conferences, and two or three public meetings. In Colorado, Judge Lindsey incorporated the Progressive party of that State. This name has been pre-empted by regular Republicans in Pennsylvania. One Republican elector in Virginia announced his intention to vote for Roosevelt. Governor Johnson appointed a committee of eighteen. Among those named were Senators Clapp, Dixon and Poindexter; Governors Aldrich and Vessey; James R. Garfield, Gifford Pinchot, William Allen White, Judge Lindsey, E. A. Van Valkenburg and William R. Prendergast. Governor Aldrich declined to serve. Other recent supporters of Mr. Roosevelt who will not assist the third party movement are Governor Hadley, Governor Deneen, Senator Borah, Charles R. Crane, William L. Ward and Ormsby McHarg. The last named, who was employed in connection with delegate contests in the South, said (according to

newspaper interviews) that he would do nothing to imperil the election of Mr. Taft, altho he believed Mr. Roosevelt had been cheated out of a nomination at Chicago. The latter, he added, had been surrounded in that city by men who did him more harm than good. As set forth by them immediately after adjournment at Chicago, the purpose of the Roosevelt leaders was to run separate tickets only in those States where the Roosevelt element does not control the organization, and to try to gain the electoral votes in other States without duplicating the party machinery. But their present purpose is said to be to have separate and distinct tickets everywhere. Mr. Prendergast, Comptroller of New York City, issued on the 1st an address or appeal to Republicans and Democrats, urging them to "enroll themselves in defense of honesty in political work and the advocacy of genuine principles of political, social and industrial reform." He represents New York on the committee appointed by Governor Johnson. A new party is a necessity, he says:

"There must be no mistaking the gravity of the task, but I will appeal to those who believe in the moral glory of American democracy. Let those who have this faith undertake the labor, which involves the contest of every place to be voted for by the people at the coming election, from President, Congressmen, Senators and Assemblymen to the lowest office on the list. A provisional organization for the State of New York will be effected without delay, to be followed as quickly as possible by a permanent organization."

Senator La Follette has published a bitter denunciation of Mr. Roosevelt and the methods used to promote his candidacy. Senator Lodge, formerly an intimate friend of the ex-President, says to the public that he is a supporter of the Taft ticket. He emphasizes the party's firm stand for constitutional principles and the independence of the courts.

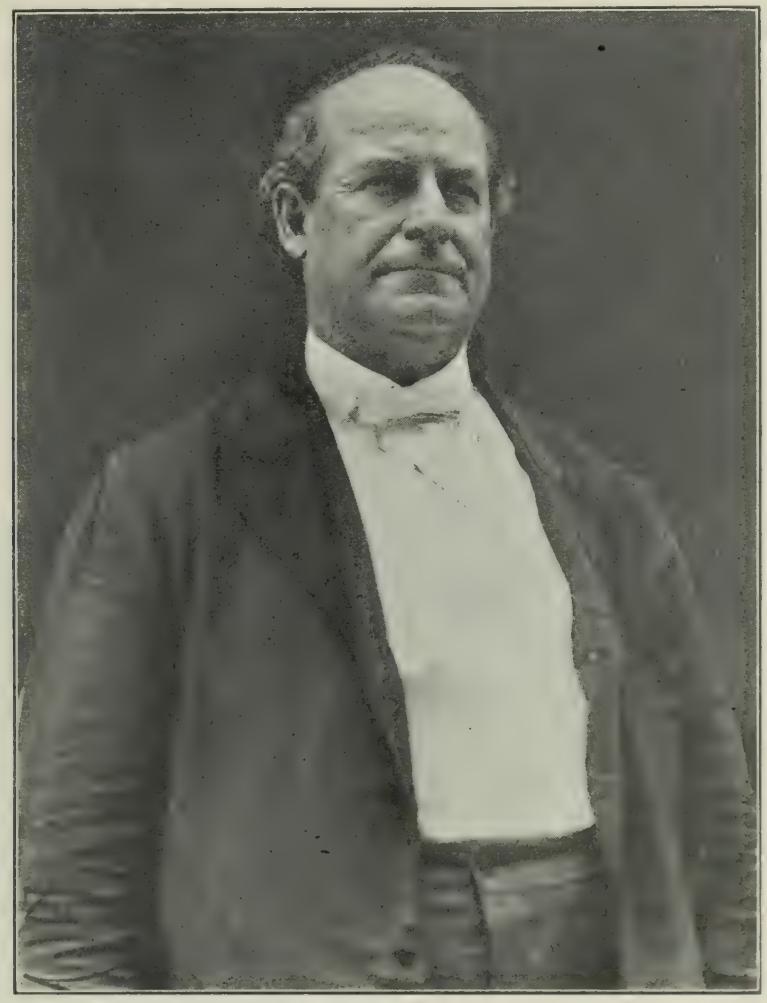
The Cuban Revolt Dying Out

General Estenoz, leader of the negro revolutionists, was killed, on the 27th, during an engagement with Government troops commanded by Lieutenant Delatorre, who shot him in a hand-to-hand encounter. This was done near Micara, and on the following day the dead leader's body was shown in Santiago. The rebels near Guantanamo at once hoisted a flag of truce. General Monteagudo said the end of the rebellion was at hand. At the end of last week it was reported that the rebels were dispersing. Our Government ordered that six warships in Cuban waters should return at once to their home stations.——There was but little fighting, last week, before the death of Estenoz. In one engagement five negroes were killed, and in another ten. The Government's commander, General Monteagudo, asserted that since the beginning of the revolt only four of his men had been killed. The three newspapers in Havana which have attacked the Gomez Government, at least one of them asserting that the revolt was instigated or procured by Gomez to serve his political ambition, defy him to prosecute them. The editors of two of them are not in Cuba, and the editor of the third is immune because he is a member of Congress.

Mexico's Revolutionists

At the end of last week General Huerta's army was only fifteen miles from Bachimba, the place chosen by Orozco for the decisive battle. Huerta had advanced slowly and was said to be awaiting attacks upon Juarez by General Sanjinez, who was moving eastward from a point near Douglas, Ariz., and by Colonel Sanchez, who was approaching Chihuahua from the northeast. There were indications that Orozco was practically surrounded. One hundred and twenty of his men, surrendering in Sonora, said he had very little ammunition. The decisive battle with Huerta was promised for the 27th; later it was said that the date might be July 2 or 3. Reports that Orozco was negotiating for a surrender appeared to be confirmed on the 29th by dispatches from the Mexican capital. These said that Madero had decided to make no reply to Orozco's offer to lay down arms if there should be amnesty for all. Huerta, confident of victory, the dispatches added, advised that no attention be paid to such a proposition. Because a battle at Juarez was expected, a considerable force of Texas rangers assembled at El Paso. It was asserted that if shots should cross the border the rangers would enter Mexico

and take part in the fight. On the 29th, Colonel Diaz, a rebel officer, was executed at Juarez for leaving the front, coming to that city and trying to start a mutiny in the garrison there. There were reports of the execution of many prisoners taken in battle. From the south came a story that 200 of Zapata's men had been killed after their surrender. There was a three hours' battle near Huitzilac, in Morelos, it was said, and 200 prisoners taken by the victorious Federal army had been hanged to trees in the edge of the forest. In the north, it was asserted, Colonel Sanchez had captured and executed thirty rebels 90 miles east of Juarez. At Velardena, 50 miles west of Torreon, drunken brigands lined up seventeen Americans in front of a barn, threatening them with death if they did not pay a ransom of $1,000,000. For $3,500, however, they spared the lives of these men. Orozco has taken possession of mines and factories abandoned by alarmed Americans, and is working the properties for his own profit.——Much loss of life and property has been caused in the city of Guanajuato by floods which followed a cloudburst.——In Los Angeles, on the 25th, there was a riot when Ricardo Flores Magon and three of his associates were sentenced to be imprisoned for eleven months for violation of our neutrality laws. Magon publishes a paper there. He is an anarchist. During Madero's revolution he and his followers attempted to establish an anarchist community in Lower California. When the sentences were announced, about a hundred Magonists attacked the police who guarded the courts. Several of them were arrested.



British Affairs

On June 25 a number of suffraget hunger-strikers were released from Holloway Prison — presumably because physicians certified that they were physically unfit to stand the pump-feeding process. Twenty-one women have now been liberated, including Mrs. Pankhurst and Mrs. Pethick-Lawrence. The latter's husband has also been released. The released prisoners at once set up a new campaign against the Government, alleging inhumanity; and they have a spokesman in Parliament in George Lansbury, Socialist. The suffragists' campaign of vandalism and hooliganism continues: the furnishings of part of a railway train were found at the end of a journey to have been destroyed, the windows smashed, and "Votes for Women" legends plastered everywhere; window smashing continues, chiefly in provincial towns; the Premier and his ministers are now and again attacked by frenzied women; the ministers and their wives receive thru the mails anonymous letters of an irritating kind.——The hostility to Mr. Lloyd-George's insurance act as it affects domestic servants and their employers resulted in a demonstration in Albert Hall on June 27, organized by ladies of title. Ten thousand women, chiefly maid servants, cheered Lady Desart's advice to refuse to pay the prescribed insurance premiums.——On June 25 the King and Queen started for Cardiff to spend four days in the South Wales coal field. The King is desirous of learning the conditions under which workers live.——A Zeppelin dirigible airship, the "Victoria Luise," left Hamburg at 6 a. m. on June 27 for a ten-hour over-sea trip, with twelve passengers. The air craft passed over Heligoland and circled Nordeney, in the North Sea. The voyage excited comment in England, where the press regards it as a proof of the possibility of an aerial invasion of that country.——The Atlantic Transport Company and some stevedoring companies have petitioned the British Government to put an end to terrorism in the London dock districts. They attach a letter signed by 440 foremen and dock workers who declare their desire to return to work, stating, however, that they cannot safely do so.——The seamen's strike in France has already cost French shipping dear. On June 29 the "Louisiane" arrived at Havre from New York and the entire crew immediately struck. Eighteen members of the crew of the "France" were sentenced on the same date to fifteen days' imprisonment for desertion on June 9. The whole crew of the "France" will appear in groups of twenty and thirty before the maritime tribunal. The Messageries Maritimes is the only company willing to arbitrate with its men.

Why the Democracy Should Win

BY WILLIAM JENNINGS BRYAN

[The following statement was given by Mr. Bryan to Charles M. Harger for use in connection with his article published elsewhere in this issue. It is so definite and characteristic a statement of the position and duty of the Democratic party, as Mr. Bryan sees them, that we take the liberty to give it separate presentation.—EDITOR.]

Copyright, Underwood & Underwood, N. Y.

MR. BRYAN AT THE CONVENTION

BECAUSE it has won the right to put its principles into practice. While in the minority during the last sixteen years it has dominated public opinion and coerced the Republican party into accepting many of its ideas. It is the only great party today with a policy and purpose and an enthusiastic membership. The Republican party is divided between the standpat element and the progressive element, and the progressive element is divided into two factions. Each branch of the Republican party would rather see the Democratic party win than to see the other branch of the party triumph. The policy of the present Administration is only an indication of what would happen if either of the three factions in the Republican party obtain control of the executive office. Until the Republican party passes thru the struggle in which it is now engaged and is unified along some line of action, it cannot hope to administer the government with satisfaction to the public. The Democratic party passed thru its regeneration sixteen years ago and is now in position to lead the progressive forces of the country.

BALTIMORE, MD.

The Two National Conventions

BY CHARLES MOREAU HARGER

[Four years ago Mr. Harger, editor of the Abilene (Kansas) *Reflector*, wrote for us accounts of both the Republican and Democratic Conventions. We have asked him to do the same for our readers this year. He was the first assistant secretary of the Republican Convention described in the following article.—EDITOR.]

I. The Republicans at Chicago

FOR more than a quarter century the Republican national conventions have been stupendous, well-staged dramas. Every piece of scenery was in place, every actor letter-perfect, every spot-light arranged, every tableau properly planned. With stately dignity the spectacle proceeded to its destined end.

The gathering at Chicago in June was a moving picture show, with some extra reels to prolong the entertainment and vaudeville attractions for the intermissions. The audience, including the 16,000 who gained admission to the Coliseum and the tens of thousands who could not, was the largest on record. The interest was keyed to high tension by expectation that something sensational would occur—and, as often happens when expectations loom large, the exhibition did not fulfil the promise of the billboards.

The first reel was devoted to the spectacular entry into Chicago of Mr. Roosevelt and his speech to shouting thousands in the Auditorium on the eve of the convention. I sat near him on the stage, and looking out over the vast gathering it seemed a little too well arranged to be really effective, a little too much officered, a little too certainly promising results. Every person was given two flags and there was a pretty picture when the brilliant banners were fluttering—but they fluttered with too much regularity—apparently on signal. The Colonel was in fighting mood and played his part perfectly. As it turned out it was the only chance he had to address a considerable audience.

Other reels were sprinkled with scenes of his occasional appearance exhorting his delegates or scurrying along the hall with policemen in close attendance—but mostly they concerned the finesse with which the controlling faction held its narrow majority. The one film for which the crowds longed and which had been exploited as the headliner of the entertainment was not shown on the canvas. Roosevelt traveled from Oyster Bay to within ten blocks of the Coliseum—and stopped. Had he marched on and presented himself at the hall history might have been written differently.

Instead, the screen showed a dreary series of roll-calls, conducted at times under riotous circumstances and with one faction always in control.

Young, sack-suited, straw-hatted, smooth-shaven, clean-cut business men, alert, clever, earnest—that was the tone color of the two thousand delegates and alternates seen from the platform. Few were the white-haired veterans. Members of the old guard who in past conventions had filled the principal roles were absent. The old soldier, once a great figure in party councils, has almost passed—lodge emblems instead of the little bronze button decorate the coat lapels.

Politics is a sifting process. It eliminates the relatively inferior and brings before the footlights those intellectually prepared for the contest. Location counts no more, as it once did. The country is too developed. Men from the far interior, like Hadley of Missouri, or from the Middle West, like Watson of Indiana—the two floor leaders—come to the front. Both are young, with clean, firm faces that it must do their mothers good to see. So with others who led the fierce discussions—they were not veterans. They were of Young America, come up by merit.

For no man more than for Governor Hadley was the convention a personal victory. His courtesy, his cool-headedness, his clean-cut arguments, made his every appearance the signal for outbursts of applause. The fact that he was doomed to defeat on every proposition,

yet never lost his patience nor his nerve, won the hearts of the vast congregation. Great was the contrast between Hadley and some fire-eating advocates of the minority who time after time were hooted down. Seldom is a public man a good loser.

More than ever was the sectional line eliminated. Except for the presence of the colored delegates from the South, one could discern no sign of prairie or of metropolis, of plaza or of veldt. Likewise was missing the exuberant newness of recently admitted States. Four years ago Oklahoma, glorifying its beginning statehood, was tempestuously in evidence. Arizona and New Mexico were entitled to declare their just accomplished majority vociferously—instead they were as quiet as country cousins at a city park.

Nor did the two women delegates attract the attention their sisters did four years ago. They were cheered when they voted and had their pictures in the papers, but it was no longer a novelty. Future conventions will have so many women delegates that it will become an old story.

THEODORE ROOSEVELT IN CHICAGO

The third term candidate speaking from the balcony of the Congress Hotel in acknowledgment of the ovation which he received on arriving in the Convention City.

While for its absence of freak attractions and in its personnel the gathering might have been a bankers' association, the assembly was as regardless of formalities as a wet town meeting in a dry district. Why does the average American think yells, cat-calls, "boos" and hisses, drowning a speaker's voice and aggravating the determination of the majority, buy anything in actual results? The one great Roosevelt demonstration of the convention, led by a pretty woman who waved a picture of the Colonel, was followed by a gain in the Taft vote on the next ballot.

Precedent had less effect on the delegates than in any other convention held by the party in thirty years. It was the weakest argument of the orators. What the audience and the delegates wanted was facts—and the most of the tumult came from the abundant presentation of alleged facts by both sides, usually irreconcilable and contradictory. At bottom it was a contest between precedent and modern radicalism — and the crowds were with the latter, and it will take good management to win them back in November.

"Milling" in the hotel corridors, tramping the sidewalks, surging curious-eyed into the headquarters, the noise was for five days an exaltation of "Teddy." For him the sleep-disturbing yells along hotel halls, for him the cheers, the songs, the roystering groups of young men who paraded in season and out of season. Electrically charged was the atmosphere —and who knew what instant might come an explosion!

But the business men, the cool-headed managers of affairs in their respective communities, were not carried away. Their influence kept the majority from wavering. Many believed it was a dangerous thing to nominate Roosevelt. They yet think so, and their influence will be powerful in the campaign. Reports of conflicting arguments between him and his lieutenants were current. The refusal of some of his leading supporters to counsel a bolt had its effect. Deep-seated among this class is belief in

party organization as a means to good government, and above their personal animosities and the rivalries for position was this cable holding steady the Taft forces. It was stronger than personal loyalty to the President, stronger than any sentiment of policy, and at election it will be felt in every community.

This is not to say that the Roosevelt boomers were not in earnest—they were intensely so, but many of them based their actions on belief in an ideal rather than on absolute faith in their candidate. Striking as was his hold on his followers, it was because he typified an ideal that he held them. This ideal went back to the individual and was based on an awakening of the average man to a demand for a more direct voice in affairs. Perhaps one delegate expressed it correctly when I put to him the question: "Do you get better men in office, do you get better laws, do you get lower taxes under the primary system?" "Probably not," was his quick reply, "but I get a chance to vote and am satisfied."

It is doubtful if Mr. Roosevelt helped his cause by coming to the city. His associates refused to bolt in the convention and so passed an opportunity for the climax of sensation for which the spectators had paid their money. The crowd wanted to see the Man on Horseback storming the Coliseum—not a manager behind guarded doors. Probably it would have been political martyrdom to have ventured into the convention hall and Mr. Roosevelt was smart enough to see it. But the crowds wanted a spectacle—it was as if they had cried "throw him to the lions!"

The primary election law, first coming above the horizon in 1908, has grown to vast proportions. The delegates selected in primary States asserted in their demeanor a superior claim to representation on the floor. "We are the people," was their confident contention. "The delegates from the convention States are merely the tools of party machinery." This grated on the nerves of organization followers and sometimes the clashes were more forceful than elegant. Making allowance for the effort of the outs to become the ins, and for personal ambition, there was yet an underlying current of belief in the party as a whole and it is likely that when the delegates get back home to the quiet country village and to the farm they will modify somewhat their excited comment and seek to maintain a united effort without which victory is impossible. Indeed, this was the attitude of many of the prominent men in the Roosevelt following, and their steady heads prevented a political cataclysm, changing it into a more moderate third party effort whose success is yet to be demonstrated. The next few weeks will show whether party precedent or individualism is stronger.

THE FIRST WOMEN DELEGATES
California sent as part of its delegation to the Republication National Convention two women: Mrs. Charles D. Blaney and Mrs. Florence C. Porter

Furthermore, many of the delegates considered this the last great convention ever to be held by the party. Said an experienced politician from Ohio when I asked him about the future: "In four years more the State chairman will make affidavit to the primary vote and mail it to the National Committee secretary—and it will be all over. A party council will frame a platform and a hotel parlor will hold the party managers. Card indexes, adding machines and mimeograph letters are taking the place of torchlight processions, the committee on credentials and the keynote speech." He forgot, however, that the National Committee is yet "regular," and the campaign plans will

be made along familiar lines. Business is to be a large factor in this fight and political predictions are risky in days of lightning changes in public sentiment. Many things may happen before November that will enhance Mr. Taft's chances.

Generally, however, the sober talk was that the present situation is serious for the Republican party. The disaffection of so large a faction means complications in every State. The Roosevelt after-convention was about as poorly arranged as it well could be—coming in a haphazard manner after the regular adjournment, it failed to exercise the impressive influence a little more skill would have brought. The films were turned rather swiftly that last day and perhaps the operators were excusable for a little dimness in the pictures.

Curious was the change that came when it was certain that Roosevelt could not win. Overnight the Napoleonic advance became a retreat and the crowd was quick to catch the change. It began to laugh—the hardest blow any cause can have. The local papers began to ridicule the Colonel and like mushrooms out came irony and crude humor. A sample of this was seen when thousands of dodgers that came near being sacrilegious were scattered thru the hotels reading

"Teddy will walk on the water of Lake Michigan at 6 p. m. He can do it. Unbelievers are invited to attend."

The last night a motor car backed into the alley in the rear of his hotel. When it reappeared, the familiar figure was in the rear seat, and a little crowd gathered to see him pass. From back in the dark a strong voice, "Long live the king!"—and the Colonel laughed with the crowd. A man decorated with a tin crown and wooden sword paraded hotel corridors proclaiming himself at intervals "King Theodore." It was all so good-natured that it kept the situation from becoming strained.

The saving grace of appreciation of a joke was present in the big hall. For instance, when Chairman Root, after deciding between contending roars that "the ayes appear to have it—the ayes have it," came to the front to make an announcement, "toot, toot" sounded from the galleries. Everybody recognized the signal of the steam roller and a laugh went up, Root joining with a smile. To Root's good nature and coolness and unquenchable firmness was due the maintenance of a semblance of order on the last day, when practically all the business of the convention was done in a tumultuous session of eleven hours.

"What about the steam roller?" a delegate interrupted a Taft speaker. "It's a contest between the steam roller and the cash register," was the quick retort, and both sides laughed. When a Roosevelt demonstration was at its hight, a poster was waved from a gallery. Supposing it to be a picture of the Colonel the cheers were redoubled. Then the light touched it—the face was Taft's. A roar of laughter went up at the joke.

HERBERT S. HADLEY, OF MISSOURI

SENATOR ELIHU ROOT, PERMANENT CHAIRMAN, AND LAFAYETTE GLEASON, SECRETARY OF THE CONVENTION

Frequent declarations of a bolt if the contesting delegates were seated brought many mock farewells from the Taft delegates. "Good by, boys, good by," they would say in assumed tearfulness. "So long, see you in November," would come the reply, and then a joint movement toward the nearest liquid dispensary. Which is to say, that among the rank and file of the delegates were, on the whole, good nature and friendliness—even tho all were determined to win their fight.

No national convention of recent years ever had such intense partisanship on the floor. Eight hundred policemen were constantly in attendance to prevent any threatened outbreak. Shoulder to shoulder they surrounded the platform. Such complimentary terms as "thief," "robber" and "liar" were bandied by the speakers and delegates on slight provocation. Yet there was no violence. The delegates were not amateurs. They were hand-picked on both sides and little things like parliamentary repartee did not disturb their souls. Besides Chairman Root showed a disposition to allow both sides all the chance possible to talk, evidently believing that it was a good thing to work off some of the pent-up enthusiasm in noise. Those delegates would in a professional gathering or a business men's association have been suave, dignified and courteous; here they were without semblance of respect for any speaker, and the man who held their attention did it by sheer ability and good nature. Woe to the orator who became angry. The crowd took a supreme delight in baiting him. The convention was exceptional in that it had no set oratorical efforts—the drama was displaced by vaudeville. Only one formal address was given—that of Chairman Root—and it was read to a noise-possessed, restless throng, not one in a hundred understanding a word of it. Every other was given directly on the business at hand and in the good old sledge-hammer style. Perhaps it was a healthy sign of return to

the ways of the fathers. A town meeting on a big scale was this national convention. If, as many believe, we are on the verge of a readjustment of our party machinery, if we are to form new alignments on issues come to the front with modern industrialism, exactly this sort of advocacy may be expected as the style of the coming campaign.

"I came to Chicago when Lincoln was nominated and saw the birth of the Republican party," said an aged Vermonter as we sat in the Roosevelt headquarters discussing the situation. On the walls were many posters declaring that corruption had ruled in the party management, that great crimes had been committed to keep the Colonel's followers from controlling the convention, that chaos and disruption were ahead if the insurgents did not win. "Now I have come here to see the party's end." This feeling and the references to the party's history, and pride in the party's record, to practically half the delegates made no appeal. They were suiting the party's principles to their ideas of present conditions, regardless of the past. This modern individualism permeated every discussion, it entered into every caucus, it was brought up in every argument. How far it will reach will depend on the second thought after a few weeks have passed—also largely on what happens at Baltimore. Perhaps it was significant that the presence of Mr. Bryan in the press seats called for frequent applause—one cannot imagine that happening in a convention of thirty years ago. Party solidarity is weakening—and never was it so apparent as in the Republicans' heated gathering. If the same spirit be carried on to election it means defeat; if, after all, party loyalty wins and the radicals decide, as many of them already have done, to make their fight inside the party instead of out of it, there will be victory. And the fact that not alone Mr. Roosevelt's fortunes but those of hundreds of State and local candidates of high and low degree depend on the outcome may in the end line up those who have been eager—for in the superheated atmosphere of the convention crowds were eager—for the fray. They believed that they would never again be delegates. "If we go to another convention," said one, "it will be to a supreme lodge of the Ancient Order of the Trustful Knights or a general conference of the Methodists." When it is remembered that most of the delegates are either office holders, or hope to be, or have a deep personal interest in some friend who is in one or the other of these classes, it means a direct effect on their personal fortunes.

Summed up, the convention was a condensed picture of the past three months of political strategy. It left a bad taste in the mouth of every believer in old-fashioned Republicansm, but by no means was it determinate in settling the issue of the election. President Taft had a support of which he may well be proud and that support was not broken.

Back of all the tumult and shouting was a healthy Americanism. Toward the close of the last day's tedious, riotous session, when opposing factions had jeered each other for many minutes, nerves were stretched almost to the breaking point. Rival demonstrations occupied the short respite from roll calls. Wildly antagonistic were the rival forces and recriminations reverberated across the vast auditorium. Suddenly from the flag-decorated balcony far up toward the ceiling the white-suited bandmaster who has been leading his musicians thru "Dixie" and "Marching Through Georgia," the strains scarcely heard above the uproar, gives a signal. Another melody sweeps over the excited thousands. In an instant, as if a benediction were bestowed upon their troubled spirits, comes silence. Every face is turned toward the band. Forgetting the rivalries and the partisanship, all voices merge in the inspiring, uplifting "My Country, 'Tis of Thee." After all, we are at heart Americans.

So the last film was run amid confusion and disturbance. Like all well-regulated great amusement enterprises there was for those who cared to stay an after concert, at which Mr. Roosevelt was put in the race as a third party candidate. Then the lights went out. Half across the continent at Baltimore the barkers were already shouting in front of another hall. Will the next performance be more satisfactory to the nation than the one just closed?

CHICAGO, ILL.

II. The Democratic Convention

THE Democratic National Convention was different. Its immediate predecessor at Chicago was a moving picture show. This was a sizzling, realistic, popular-priced drama, with full complement of mechanical effects, thrilling rescues, and, at the end, a stage full of dead actors.

Baltimore was chesty over its position as host. Streets were decorated profusely. The people, with characteristic Southern courtesy, exerted themselves to make every visitor welcome. As few guests ever were able to find their way about the oddly planned streets, it meant endless question-asking. "That is nothing," explained a policeman, smiling. "Some folks who have lived here for years can't find their way 'round town."

On the whole, the arrangements were not so well carried out as at Denver four years ago. The Armory was too large for more than a semblance of order; the narrow streets were congested with traffic. Perhaps there was some excuse—it was frightfully hot and at intervals it rained. The police regulations were less perfect than at the Republican meeting.

Far noisier was the crowd than at Chicago. It yelled itself hoarse far into the night; it surged thru the various gaily adorned headquarters; it organized impromptu parades for favorite sons. Furthermore, it was not so high class a crowd as at Chicago—more men had unprest clothes and looked as tho they might carry lunch baskets. But the leaders were proud of it—the plain people, they said, were here. Even the hall arrangements were democratic — plain pine boards and gaspipe rails for the platform—no plush cords, brass standards or mahogany furniture. Chicago played no favorites in decorations; here, Washington, Jefferson and Jackson looked down on the assembly. Marching clubs from the big Eastern cities were noticeably absent. On the whole, Baltimore was disappointed in the crowd's size. The abolition of the pass has had its effect on convention attend-

THE CROWD OPPOSITE THE BALTIMORE CONVENTION HALL, SHOWN ON THE RIGHT

THE BALTIMORE CONVENTION IN SESSION

Twenty-five thousand persons were accommodated in the great armory. Some of the spectators are in shirt-sleeves; the wonder is that more of them are not making concessions to Baltimore weather. Complaint was made on Wednesday of the unscrupulous doorkeeper, who accepted bribes from those who had no tickets but sought admission; and the charge was made that an attempt to pack the convention in the interests of Champ Clark, in order to make a great demonstration, was partly responsible for the disorder.

ance. It was as well that no more came, for the Maryland metropolis had its hands full as it was.

Not a colored man was among the delegates, who, as a body, were more rough and ready in appearance than those at Chicago—more men with white goatees and white mustaches, more men with dress distinctive of West or South. Despite the high tension of factionalism, the Chicago convention was better controlled in a technical sense than this. But Senator Root is a far better chairman than Judge Parker, and by the time Ollie James came to the chair with the permanent organization the crowds were too large and unruly to manage.

The feminine feature was in evidence, of course—and it was characteristic of the American admiration for prominent women that Mrs. Taft received quite as much homage and attention as the wife of any Democratic leader's family. Champ Clark's daughter distinguished herself by leading a demonstration for her father; she evidently has ambitions to be an administration "princess."

The party menagerie was increased by adding the houn' dog to the donkey and the Tammany tiger, and the trio furnished much amusement. The Democracy appears to have aspirations for copyrighting a considerable part of the animal kingdom as its especial property. The "Houn' Song" alternated with "Dixie" and other national tunes in the bands' repertoire, and became a good deal of a nuisance after it had been played several hundred times.

Only one of the Republican candidates for the Presidential nomination attended the convention—La Follette. While a photographer was taking his portrait he sat idly drawing a crude face outline that

EX-JUDGE ALTON B. PARKER
Temporary chairman of the Democratic National Convention

showed a pair of glasses, a sturdy nose and a large mouth adorned with prominent teeth. Who can he have been thinking of—and what?

So much for the setting. The temperament of the attendants was quite another matter. This is evidently an open season for the smashing of idols. Mr. Bryan found himself in somewhat analogous position to Mr. Roosevelt at Chicago—he had against him the regular organization, and it took its first fall out of him in the very opening act, when he was defeated for temporary chairman of the convention. With his usual good nature he did not take it very seriously. He had the crowds with him and later won back the leadership to which he aspired.

The attitude toward Mr. Bryan was an interesting study. Four years ago he remained at Lincoln and directed the doings of the convention by long distance telephone. Now he came in person and made his fight from the platform. A great deal appeared in the papers during the week concerning the domination of the Money Trust and kindred influences. Actually, the average delegate did not get to quite such a fine analysis as did the three times candidate for President. The delegate was for his favorite candidate, and when he believed that there was in Mr. Bryan's attitude anything adverse thereto he did not hesitate to say so. It was from one point of view pathetic when, after leading his party three times as a Presidential candidate, and following an address into which he threw all his eloquence and political acumen, he was refused the honor of temporary chairman. But this is to be considered: Before him in the delegations were hundreds of young men who wore knee trousers in 1896—they knew not Bryan as their fathers have known him. They had not shouted for "sixteen to one" and had not followed the advice of the man who has been for sixteen years the greatest force in the party. "We are as good Democrats as Mr. Bryan ever was," shouted one speaker, and the crowd cheered—but the crowd cheered on every provocation.

So, too, was there noticeable an alliance between the East and South. While it was charged that this was a corrupt alliance against the West and Northwest, it was not strikingly apparent on the face of things. The Western States, with their new primary laws, came in for positive declaration of actual representation from the people—as was the case at Chicago—that could not be understood in more conservative sections of the country. The primary movement has a real significance in modern politics and it haunted Democratic leaders as well as Republican managers.

The relation between the party machinery and the primary laws of the States will be one of the large questions before the public during the next few years. It was one of the things with which both conventions had to deal, and they handled it in different ways. The Republicans held that the party was not bound by State laws; the Democrats that it was. It is difficult to see why the party machinery should be regulated by statute, which has nothing to do with politics, and when very readily it might be possible for a legislature of one political faith to enact embarrassing laws for the regulation of its rival party organization.

The Democrats, if convention manners are an index, are in fighting trim. They acted as if every delegate had come imbued with the idea that he must name a winning ticket, and trivialities were overlooked to secure that end. While the whispering in the leader's rooms was not audible to him he was amenable to orders. It was impress upon him that this was a chance of a lifetime.

So there was in the rivalries of the candidates' following a cheerful banter. The advocates were good fellows all thru. It needed no policemen to make sure that there would be no personal violence.

And, oh, the oratory! It bubbled and sparkled; it took aeroplane flights; it drew down the cerulean dome to bear witness; it flowed like Tennyson's brook; it was sprinkled with poetry, punctuated with aphorism, dignified with the quotations from the Democratic fathers, and multiplied its perorations with all the symbolism of mythology. When business lagged always was there a perfervid speaker to tear to tatters the Republican pretensions to favor—and the crowd yelled and threw into the air hats and bric-à-brac in gleeful joy. That was the show it wanted and for which it had come. Those Southerners with their soft vowels and hyperboles won the very hearts of the congregation. One great forum of eloquence it seemed and was inspired by hope of victory. After all, for what is a national convention but to give the people a chance to hear the party's orators?

Political oratory is about the only form of expression that has not been touched by the modern spirit of realism. In literature we have details of practical life; on the stage are real food and real fire engines; on the political rostrum yet reigns the flamboyant flourishing of glittering generalities. But that, too, will pass; and the rural free delivery and the farmer's telephone will bring speakers down to facts and figures as a method of enticing the national bird of freedom. The Republicans so adapted their addresses because it was necessary—but here was only unlimited soaring in the realms of linguistic adornment.

Then the demonstrations—how they blossomed! Some day I am going to write a story about the manufacture of political demonstrations and shall take my material from the history made at Baltimore. When you see men sneaking into the hall with horns, megaphones, sectional fishpoles, live roosters, folded banners, huge posters and flags, you may be assured that there is a reason. Then when the orator at the precise psychological instant pronounces the name of "the man who" it breaks. The people stand, the reporters leap to tops of desks, everybody yells "sit down," and nobody sits down. Pandemonium reigns. It reigned at intervals all thru the sessions. Sometimes it came at the right time; sometimes it was evidently premature. This sort of self-hypnotism which possesses every national convention is so thoroly understood and so systematically planned that it has little influence on the delegates—but how the people do enjoy it!

Always some hero's personality dominates a convention. At Chicago it was Roosevelt; here it was Bryan. But the greater noise of the streets was for Wilson. Perhaps the presence and enthusiasm of Princeton alumni had something to do with it. One great banner proudly proclaimed that Wilson was born in Staunton, Virginia. tho just what that had to do with it was not

OLLIE JAMES, OF KENTUCKY
Permanent chairman of the Democratic National Convention

clear. The Clark men made a showing, too, and automatic electric eyes in a great houn' dog winked at the headquarters. The American public is quick to catch points. Across the bottom of a large oil painting of Clark was placed this: "Don't he look like a President?" And pinned to it with a Wilson button was the answer: "Yes, he do."

The suffragets were on hand. Their yellow flags were scattered freely. They had a parade of 1,000 women, and wanted to march thru the hall, but did not succeed.

For the first time in a generation was a variation from the usual routine of a convention—the platform was made after the selection of a candidate instead of before. It was Mr. Bryan's idea. And why not? The platform ought to have some relation to the candidate, and especially in a year when personalities are to have as much influence as declarations of principles. It is a part of the readjustment of political procedure. It fits into the modern scheme of things.

While Mr. Bryan did not insist on being the heavy villain of the play, he did enter at frequent intervals to start trouble for the conservatives. Never was there a more dramatic scene in a convention than when, without warning, he introduced a resolution declaring that those connected in any way with the Morgan-Ryan-Belmont interests should by no means have a place in the convention. That it was adopted argued for the sentiment of the large majority of the delegates. But this was apparent: The Democrats propose to keep their party intact. They expect to adapt themselves to the progressive movement without breaking the organization. Perhaps something of this is due to the fact that they are not in power. It makes a difference whether one is out or in when such questions arise. While not all Mr. Bryan's dramatic effects were successful, because you cannot always tell by a dress rehearsal just what will please the regular audience, on the whole he gave a striking key to the sessions and made the performance lead up to a semi-climax in every act.

Nervous people are always clamoring for reform in the conducting of a convention. They declare that it is little less than barbarous for the yelling public to howl around the delegates thru long, weary hours like Indians at a war dance, to the evident distraction and delay of business. They want the delegates to meet in solemn state, go thru with the simple form of the convention procedure and adjourn. What would become of the hotel keepers; what of the entertainment for the public; what of the real object of all this noise and fanfare—the exciting of the nation to an impression that there is great interest in politics and especially in the kind of politics the party represents? No, the big convention is not to be disturbed; it will grow larger and noisier so long as larger halls can be found in which to put it—and the megaphone will become the recognized implement of oratory, as it ought to be on such occasions always. That is, provided we have any national conventions at all. They will be either increased with the nation's growth and the ability of sightseers to attend or they will be abolished as a piece of the party machinery.

At last, after all the wearisome preliminaries, came the balloting—a good, old-fashioned deadlock that wore out patience and was the despair of the prophets. The convention was determined to break all records, and its long-distance Marathon obstinacy race was evidence that the spirit of Old Hickory is not yet departed from Democracy. Balloting is all right for awhile, but when the secretary has shouted some thirty-five times the names of all the States and Territories, with interruptions and disputes, it becomes monotonous. Some delegates went out and slept on the grass, leaving their chairmen to vote for them; others stayed by the ship. Again and again Mr. Bryan drove home his determination to purge the party of reactionaries. Cheers and jeers mingled in his reception. It took courage to be patient on that long Saturday session.

After a Sunday's rest the delegates felt better—except in pocketbook. The hotelkeepers will retire rich with one more such convention.

As this is written the long, weary deadlock voting goes over to Tuesday, with Wilson far in the lead, but the result no one yet knows.

Why Should We Fortify the Panama Canal?

BY FRANK W. MONDELL

MEMBER OF CONGRESS FROM WYOMING.

THE veteran statesman, Eugene Hale, said, on the floor of the Senate, that this nation was Army and Navy mad. Congress lent color to the indictment when, in the closing days of the last Congress, it made a first appropriation of $3,000,000 to begin the fortification of the Panama Canal. Careful estimates of the final cost of the initial work place it at not less than $50,000,000. In this first appropriation Congress apparently indorsed the entire plan. A second appropriation will shortly be called for and it will be voted, unless the people make a determined protest and restrain their representatives from carrying out this utterly unprofitable and distinctly dangerous program. If the people understood they would protest.

For years we have been emptying the Treasury into the War and Navy Departments with reckless prodigality, supporting the most expensive military system ever known on earth, while this new proposition to enlarge its scope is the more astonishing because our national aspirations, theories and convictions are all opposed to it. The first appropriation was carried against the earnest protests of many able and patriotic members of Congress. It was carried by a cry for "armed neutrality" and that slogan of a departed age of feudal despotism—"In time of peace prepare for war." It was a shock to many, even of those who are under the influence of the mania of militarism, when it was announced that the bill had passed; for there were few beyond the most devoted camp-followers who really believed that Congress would ever seriously consider the fortification of the canal.

Today a strong movement is going on in Congress to prevent further appropriations along this line, but it needs the help of public opinion. It will receive it if the people will only look seriously into the subject instead of thoughtlessly following the predilections of boyhood to run after soldiers; if they would realize that while this initial expenditure of a probable fifty million dollars has not, itself, the shadow of a chance of being of practical benefit, it entails other immense expenditures which at once become automatically obligatory, and that, whatever may be promised to the contrary, in the natural course of things it is but the modest forerunner of vaster demands which must of necessity be granted by Congress if we adopt the policy of depending upon fortifications for the protection of the canal.

Even if the whole question was closed with the appropriation of fifty millions for fortification, there would be added to the cost of the canal the annual interest, $1,500,000; the annual depreciation, placed at $5,000,000; the annual cost of maintaining the force behind the guns—which a year ago was placed by General Wood at seven thousand men and a minimum cost of $8,400,000, but which he has since raised to twelve thousand men with proportionate increase in cost—adding at least $17,000,000 annually to the already serious burden which we are handing down to posterity on account of the canal—$11,225,000, interest on the authorized bond issue and $7,000,000 estimated for the ordinary maintenance of the canal, not allowing for any serious accidents. Thus, at a low estimate, the United States Treasury must stand pledged for $35,000,000, annually, while the bravest hopes for revenue accruing to the Government thru the use of the canal do not venture materially above $4,000,000 a year. Without further incidents and no accidents, the Panama Canal means a certain loss to the people of the United States of at least $31,000,000 a year.

But there will be accidents and there *are* further incidents. With army ap-

propriations alone, if progress is made in the art of war as during the last ten years, another decade of perfect peace will find all that we do today obsolete and pitiably inadequate—helplessly old-fashioned as the present harbor defenses of our great cities and useless as the Dewey dry-dock at the bottom of Subig Bay. To keep pace with progress in even a plausible pretense at protecting the canal against the world would mean a literal mortgage of the United States; while the canal would still remain as vulnerable as the Philippines, really protected just as they are, by the potent fact that while every one wants the use of them no one hankers after the expensive ownership.

But army appropriations will not stand alone. Already the Navy Department wants a war harbor, at either end of the canal, as indispensable to its usefulness. Preparing and protecting such harbors cannot be accomplished for $50,000,000. It is also provided that there shall be naval stations and dry docks, as a matter of necessity, at a cost of from $50,000,000 to $100,000,000 more, if properly and adequately equipped, in a way to be of real war value.

The saddest feature of all this is the absolute inertia of the public. I believe that it is as often indifference as it is military madness—indifference due to our system of indirect taxation. We know that the United States is rich and we like to parade the fact before other nations, just as some people like to parade their individual wealth before their neighbors. In the popular hysteria of the world today the army and navy appeal to us as the ideal thing to decorate for this purpose. No one has the remotest expectation of ever applying any of these decorations to real war. We simply enjoy the splurge because other nations—with some substantial excuse for it—appear to us to be splurging. We complimented ourselves immensely on sending a fleet of big battleships round the world—tho to keep it going we had to hire of other nations a larger fleet of supply ships and in the end only betrayed the helplessness of our own navy for anything like real war. We do it all without realizing the silly side—or the serious side that these extravagant policies exhaust this nation's wealth to a far greater extent than army and navy maintenance exhausts the wealth of other nations. We thoughtlessly dissipate our most precious economic resources, deprive ourselves of the productive energy of thousands of hands and brains, and incidentally materially increase our cost of living.

From the President down we hear brave talk of Government economy. For sweet economy's sake Congress peremptorily refuses appropriations for much needed home development which would incalculably increase the value and wealth of our country; yet we annually pass the billion dollar mark, lavishing money for the development of our army and navy—appropriations which are unproductive, unremunerative, largely exhausted and gone with the going of each fiscal year.

For the past ten years we have expended 73 per cent. of our entire Federal income on war—past and future. In preparing for dream-wars we have spent $2,200,000,000 in the past ten years—a sum only $500,000,000 less than our entire national debt at the *close* of the Civil War. The entire loss by fire, in the whole of North America, in the last *eighty-five years*, amounts to about one-quarter of what we have spent in the last *ten years* to maintain our military policy. Yet today we are told by our great militarists that we are deplorably weak. Official reports (published and suppressed) declare that almost any nation on earth could invade and desolate our land. Thru a decade of profound peace, with constantly increasing certainty of perpetual peace, we have refused much needed expenditures for the development of our country and seen the cost of living constantly increase, that we might devote more than $200,000,000 a year to the demands of our fighting men—to insure our country against being swept from the map by some vague, impossible enemy—only to learn from them, today, that we are less adequately prepared for war than at any time in our history. As a simple business proposition, after such experience we should hesitate when the same agents urge this new policy, costing hundreds of millions more to protect the Panama Canal.

Incidentally we must remember that

the canal can be absolutely protected by neutralization treaties; that it is as safe today, and always will be, as the Suez Canal, which has existed in the very hotbed of war, without a single fort or battleship to defend it, and with never one single attempt to injure it. We must admit that it is a great waste of money to fortify the canal, while as a theory it is the most dangerous which the nation could follow, and as a policy it is morally wrong. Even if it cost us absolutely nothing, there is every reason why we should not fortify the canal, and there is not one honorable or practical reason why we should. It is diametrically contrary to the public opinion we have officially exprest thru almost a century while a canal connecting the two oceans has been a topic of world-wide discussion. We have radically opposed any possibility that such a waterway should ever become an asset of war.

Let us glance at our participation in the pre-natal history of the canal. In 1826, Henry Clay, Secretary of State under John Quincy Adams, wrote officially:

"If this work should ever be executed, so as to admit the passage of sea vessels from ocean to ocean, the benefits of it ought not to be exclusively appropriated to any one nation, but should be extended to all parts of the globe alike."

A few years later, the United States Senate adopted a resolution requesting the President to

"open negotiations with other governments for the purpose of securing forever, by treaty stipulations, the free and equal rights of all nations for navigating any canal constructed across the Isthmus of Panama, upon the payment of reasonable tolls."

In 1839, the House of Representatives unanimously adopted a resolution to investigate the practicability of a canal and "of securing forever, by suitable treaty stipulations, the free and equal right of navigating such a canal to all nations."

In 1847, President Polk, sending the Senate the treaty with New Granada, said:

"The ultimate object is to secure to all nations the free and equal right of passage over the isthmus. There does not appear to be any other effectual means of securing to all nations the advantages of this important passage but by the guarantee of the great commercial powers that the isthmus shall be neutral territory. The interests of the world at stake are so important that the security of this passage between the two oceans cannot be suffered to depend upon the wars and revolutions which may arise among different nations."

In 1858, Mr. Cass, Secretary of State, put the proposition even more strongly, and in 1881, Mr. Blaine, while Secretary of State, wrote, officially, to Minister Lowell, in London:

"The United States recognizes the property guaranty of neutrality as essential to the construction and successful operation of any highway across the Isthmus of Panama."

In 1885, President Cleveland said:

"Whatever highway may be constructed across the barrier dividing the two great maritime areas of the world, must be for the world's benefit, a trust for mankind, *to be removed from the chance of domination by any single power, nor become a point of invitation for hostilities, or a prize for warlike ambition.*"

All this was our opinion before we expected to become proprietors, but President Roosevelt said, in his special message to Congress: "The principle enunciated by Secretary Cass was sound then and it is sound now"—a sentiment to which many still say "Amen."

The great powers controlling the Suez Canal were the strongest on the earth at the time, but, realizing the difficulties and dangers of a policy of defense, they neutralized the canal by international treaties, declaring it "forever free and open to all nations, in time of war as in time of peace, to every vessel of commerce or of war, without distinction of flag." And tho wars have been waged all about it no hand was ever raised to injure it—or ever will be—because it is a neutralized highway of the world. If forts had been established there would have been "a point of invitation for hostilities," and if they had been captured, the canal would rightly have been considered a perquisite of war. It will be precisely the same with the Panama Canal.

But to go on a little farther in the history of our canal. In 1901, we consummated a treaty with Great Britain, in which the theories and principles of neutralization were taken, almost word for word, from the Convention of Constantinople, concerning the Suez Canal, and mutually accepted as applying to the Panama Canal. That treaty—our treaty with Great Britain—says:

"The canal shall never be blockaded nor shall any right of war be exercised or any act of hostility committed within it. . . . The plant, establishment, buildings, and all work necessary to the construction, and maintenance and operation of the canal shall be deemed a part thereof for the purposes of this treaty, and in time of war, as in time of peace, shall enjoy complete immunity from attack or injury by belligerents and from acts calculated to impair their usefulness as parts of the canal."

If our fighting departments deem these forts and naval stations as included in this treaty they are demanding these colossal expenditures simply for amusement—to play with painted ships upon a painted ocean. If not, then they know that by these expenditures they cause us to vitiate all of the benefits of neutralization, inviting assaults upon the canal and making it "a prize for warlike ambition." In other words, they cause us to discard the perfect and perpetual protection of neutralization, which would cost us nothing, for the doubtful defense afforded by our own army and navy, at an initial outlay of hundreds of millions of dollars, and an annual cost of many millions more; with the added certainty that if there should ever be a war their presence there will throw the canal into otherwise impossible danger.

Obviously, this military outlay will not be profitable in time of peace. Still less is it expedient if there is any possibility of war. But our Government went yet farther in promising neutrality. In 1903 we entered into treaty with Panama for the right to construct and maintain a canal. In this treaty we promise that "the canal, when constructed, *and the entrances* thereto, shall be neutral in perpetuity, and shall be open in conformity with all the stipulations of the treaty" with Great Britain.

This suggests an important fact which we must not overlook, and that is that we do not own, in sovereign right, one single foot of land in Panama. We only acquired the right to construct and maintain a canal across the Isthmus, for the benefit of the commerce of the world; leaving no possible excuse which we can give for those fortifications which is not in violent antagonism to all of our promises and pledges. Why, indeed, should we set this gift to the commerce of the world in a frame of forts and battleships? There is only one possible excuse, and that redounds to our disgrace and shame.

It is true, as the advocates claimed, that nothing in the treaties positively prohibits the fortifications—except that in a general way we overstep the rights granted us by Panama; but it is obvious that the very idea of fortification was so foreign and antagonistic to every theory of neutralization, and so abhorrent to every principle ever advanced by the United States, that it would have been deemed absurd, at the time when the treaties were signed, to deny or abrogate the right. So that our only excuse for erecting the fortifications, today, is a hideous declaration to the nations of the earth that we do not propose to trust their promises or to keep our own; that they will use the canal only while it is for our interest to allow it. This is not overdrawn. Read the statements made by Lieutenant-General Wood, the Chief of Staff, to the Committee on Appropriations in the House:

The Chairman asked: "Is it not true, in the last analysis, that the purpose, in fortifying the canal, is to insure to the United States its use as a military assets, in case of war?"

General Wood: "That is undoubtedly the most important of all purposes in fortifying the canal."

Another Member: "To secure to the United States the exclusive control of the canal in time of hostilities?"

General Wood: "That is the principal purpose of fortifying the canal. . . . to control it, in time of war, as our safety and interest demands."

This, then, is why we fortify the Panama Canal. We, the great advocate of peace and honor among nations, who began the canal for glory and the unhampered commerce of the world, have decided to finish it as an asset of war for ourselves, only to be used by others in accordance with our interests. It is doubtless true, as stated in debate, on the floor of the House, that England had been approached and had signified that she found nothing in her treaty to prevent our erecting fortifications if we chose. But England's real comment upon our changed attitude came a little later, when she began the expenditure of a large sum, making another Gibraltar of her already formidable naval station at Jamaica, almost

opposite the entrance to the canal. And how the other nations of the world must laugh at us—laugh in their sleeves at us—that we neglect Honolulu, Samoa and other really strategic points, which at comparatively small cost (like Jamaica) might be made strongholds of infinite importance in defense, while we expend hundreds of millions of dollars in efforts to defend the colossal canal, which, if it is not already invulnerably immune, can be made so thru neutralization; and which, no matter how well we may defend it, can be utterly wrecked at any moment by a bomb dropped from an airship, or a "Merrimac," blown up by some patriotic "Hobson," in one of the locks. And how they must enjoy the quiet comment of the work going on at Jamaica.

There is not a nation on the earth which would dare to disregard its obligations to the commerce of the world by doing any injury to the great international water-way. Even as a war asset it is of far greater value to us, left unguarded, except by neutralization, than if fortified beyond any possibility in our power; while, on the other hand, if we desire to challenge the world to injure or capture the canal, there is no better way of extending the invitation—and of securing the result—than by taking upon ourselves, as we are doing, the barbaric responsibility of preserving it by force of arms. Suppose a time of war and that we reserved the canal for our own use, giving us a great advantage over the enemy. What is surer than that the enemy would wreck it, as our important asset. Suppose the same war with the canal unfortified and strictly neutral. What is surer than that any enemy would scrupulously refrain from injuring it? It would not be an act of hostility against the United States, but against the entire commercial world, which would be universally resented. France and England realized this from the outset, concerning the Suez Canal.

The proper policing of the canal, at all times, is our duty. It is easily, simply and effectively accomplished. We shall do it anyway, wholly irrespective of the forts. We shall do it at no great expense, as a part of the cost of maintenance. In policing the entrances we can even utilize, at no cost whatever, a few of our already equipped battleships, giving them, at last, a little real responsibility. But the fortifications and war harbors are solely and absolutely for nothing in the world but war! We have even officially acknowledged it.

Let us look into this point a little farther; for here comes in the silly side. War presupposes an enemy. Puzzle! Find the enemy. The menace of a hostile fleet at Panama is most remote. It requires no prophet to predict that not in this twentieth century shall we become entangled with any European Power capable of sending such a fleet across the Atlantic. Nor does it take the wisdom of a sage to realize that England, France and Germany will see to it that the canal is handled as carefully as we could wish. For they are the ones who will derive the benefits—with their vast commercial interests upon the sea—and simply by the payment of accruing tolls; while we, with but a few lone merchantmen flying our flag on either ocean, to take advantage of the waterway, must foot the bills, repair all damages, bear all losses, and maintain the canal for the benefit of the commerce of the world.

On the other side of the canal the nearest possible enemy is 8,000 miles away; and so busy, and so successful in absorbing the fading remnant of our commerce in the Pacific that it considers any other kind of war with the United States unthinkable. Some few Americans have been Hobsonized into believing that Japan is ready to rise in wrath and obliterate America. But even Mr. Hobson would be slow to admit that she would run the international risk of obliterating the canal—unless we have fortifications there and use it as a war asset. Besides, Japan's budget, for the next six years, includes $6,500,000 a year for her navy; while we propose, during the same time, to expend at the least $130,000,000 a year upon our navy—without taking into account any new war harbors or appurtenances thereto. But if we are still afraid of Japan, one-tenth of the first cost of protecting the canal, if expended upon Pearl Harbor, Honolulu, and on our Samoan harbor, would create two stalwart naval stations on the Pacific, which would forever prevent Japan from the possibility of bringing a battleship

within a thousand miles of either Panama or California.

Where, then, is the enemy, in fear of which we expend these hundreds of millions of dollars in fortifying the Panama Canal? If searching the twentieth century thru does not disclose the remotest possibility more formidable than a dream, can we not calm our fears with the assurance that a few of the big battleships from our otherwise utterly useless navy, patrolling the waters at either entrance, can probably protect the canal from any possible vagrant of the sea?

This is the exact situation; the folly, the danger, and the crime in our expending millions upon millions of dollars in fortifying the canal. The first appropriation asked for was small. The main object in securing it was to bind Congress to an indorsement of the policy, for the benefit of future appropriations. Now is the last opportunity for public sentiment to demand a halt. Those in Congress most earnestly opposed to the policy are rousing for one more struggle to veto it; but they need the aid of public sentiment—and they ought to have it.

The social and economic organization of the world has advanced beyond the political organization, and far beyond the military organization. Industrially and commercially we are living in the twentieth century—not back in the eighteenth or earlier. Commerce, industry and finance have created empires more comprehensive than any federation of nations; world spheres, knowing no international boundary; binding nations together with chains of gold which render belligerency suicidal. It is only the old hysteria of militarism which instigates us still to run mad over the feudal policies of forts, just as we used to run after the soldiers parading on election days. But with such an age as ours to live up to, with such a record for international arbitration and world-peace as ours has been, can we not shake off the charm of the smell of gunpowder and the clank of spurs, and repudiate this proposition now, before it is too late. Realizing the inordinate extravagance, the dangerous folly of it, and the preposterous absurdity, can we not rouse ourselves and oust from our national policy, forever, the barbaric theory that promises are pie-crust and that might makes right.

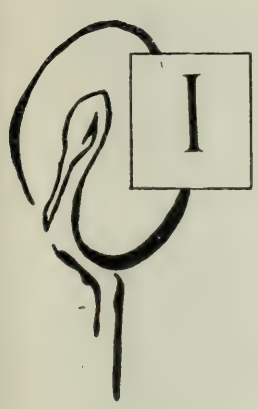
WASHINGTON, D. C.

The Playground of Dead Children

BY GERTRUDE H. McGIFFERT

"It was always summer in the Playground of Dead Children and I stayed longest there."

SOFT moss grew here for tender stumbling feet,
Low seats upon smooth rocks they found, spice-seeds
And aromatic leaves for feasts. Gay beads
They hunted hid in fragrant pods, and sweet,
Tart berries far in witches' wild retreat.
Brisk squirrels dropt them nuts, and water-reeds
Piped gladly when they danced upon the meads;
Birds brought them tidings, brooks conveyed their fleet.



'Twas always summer and the days were bright
With brightness lost from homes bereft and dark.
All seemed abundant, glad, save when at night
They wept for arms but dimly missed by day.
Then singing angels held them till the lark
Bid all God's cherished children wake and play.

NEW YORK CITY.

The Home Accomplishments of Japanese Girls

BY YEI T. OZAKI

Mayoress of Tokyo.

IN describing the home accomplishments of Japanese girls it must first be stated that the outlook on life for the Japanese girl is a very different one from that of her Western sister. The system of Oriental education from time immemorial has trained the Japanese to think more of their duties than of their rights; and especially is this the case of the Japanese woman, whose duties are summed up in the two great words, *obedience* and *loyalty*. These virtues the Japanese girl has been trained to cultivate to the point of absolute resignation and self-sacrifice. The serenity and dignity, urbanity and calmness of demeanor of the well-born girl under all circumstances, even the most trying and startling, is the result of this exigent training.

This training prepares her for adverse circumstances; to be passively courageous and cheerful in times of trouble and emergency, with patience and tact to smooth away the difficulties of life as they arise, and, in fact, to spend herself and her energy in the service and for the good of others.

So even in the home accomplishments, where we might expect to find some abandon, some pleasure-seeking or self-assertion, we find that they are of an æsthetic nature, teaching self-repression, contemplation, control of temper and presence of mind, carefulness, order, and a religious spirit, harmonizing in the letter and spirit with the old teachings.

The chief accomplishments of the Japanese girl are:

1st. Writing.
2d. Composing poetry.
3d. Ikebana or flower arrangement.
4th. Cha-no-Yu. Ceremonial tea.
5th. Music, the playing of the koto, samisen, or kokyu.

A good handwriting is, perhaps, the most important accomplishment of a Japanese woman of culture—for the way the hand and fingers are used teaches from the earliest years such manual dexterity, and trains the eyes to such accurate observation that writing may be considered the secret of all the arts. It is certainly the first step to Japanese painting, which comes easily after a good "hand" is acquired.

For the lesson the little girl sits on her knees and heels on the mats at a low table. The Indian ink she prepares with water, rubbing the black oblong on a stone. Large sheets of soft paper are put before her. The teacher writes a hieroglyphic on one sheet and the pupil, with her soft brush dipped in the ink, her hand and arm without any support from the shoulder, writes it over and over again, the teacher correcting each time, till at last name and form are indelibly imprest on her memory, and so on till thousands of ideographs are memorized. At first she is taught the easy Japanese phonetic alphabet, invented in the eighth and ninth centuries, and then by degrees the complicated Chinese hieroglyphics.

Later on, copy-books are used. These consist of sample poems and letters in the handwriting of masters, both ancient and modern. A good handwriting is more highly prized by the Japanese than any other accomplishment. The post-graduate course of the Peeresses's School devotes four hours a week to this study, and a conscientious student, besides this, will practise at home for an hour every day.

"It is difficult for the inexperienced European eye to distinguish in Chinese or Japanese writing those characteristics implied by our term 'hand' in the sense of individual style. But the Japanese scholar never forgets the peculiarities of

HOME STUDY IN JAPAN

a handwriting once seen; and he can even guess at the approximate age of the writer. Chinese and Japanese authors claim that the color (quality) of the ink used tells something of the character of the writer. As every person grinds or prepares his own ink, the deeper and clearer black would at least indicate some-

thing of personal carefulness and of the sense of beauty."*

Handwriting is the criterion of a woman's personality, her mentality, her education. Many are the stories told concerning the beautiful writing of hieroglyphics. In history, in romance, in everyday life, men often fall in love with a woman's writing, and seek till they find, and can ask in marriage, the hand that has won their admiration.

The composition of poems is naturally mentioned with writing. In Japan "poetry has been for centuries a universal fashion of emotional utterance." Not only has the composition of short poems been the refined amusement of every educated Japanese from the most early times, but the old ethical teaching taught the practice of it more as a moral duty than a literary art. In times of grief, of anger, of misfortune, of disappointment, of separation, of facing death, women, as well as men, were trained to still their minds sufficiently to compose a poem as an evidence of self-mastery. The short poem or Tanka of thirty-one syllables in lines of five, seven, five, seven, seven, syllables each has always been the most popular form of verse, and has been honored in all ages by the patronage and encouragement of the Emperor and his Court. To this day every new year there is a poetical competition at Court. His Majesty sets the theme, and all his subjects, without distinction of rank or wealth, of sex or age, are invited to compete for the laurels of the best poem, and the winner's name and verse are published in the newspapers. The humblest subject is thus permitted to approach the throne thru the medium of poetry.

Her Imperial Majesty, our gracious Empress Haruko, is a poet, and, it is said, won her exalted position by the merit of her verse. The story relates that when the Emperor decided to marry, he commanded the eligible princesses (who can only be chosen from five Court noble families) each to write a poem. That of the Princess Ichijo Haruko proved to be the best, and she was thus chosen to be the Imperial Consort.

A few quotations from Her Majesty's poems will be of great interest here:

*Lafcadio Hearn.

POEMS BY HER MAJESTY THE EMPRESS HARUKO.*

At night I sit, and looking o'er the fields,
Think of the myriad poor and all their toil,
And, as I think, my sleeve is wet with tears.

TO THE STUDENTS AT THE PEERESS'S SCHOOL.

The water placed in goblet, bowl, or cup,
Changes its shape to its receptacle,
And so our plastic souls take various shapes
And characters of good or ill, to fit
The good or evil in the choice of friends.
And let your special love be given to those
Whose strength of character may prove the whip
That drives you onward to fair wisdom's goal.

TO BARON TAKASAKI, AFTER READING A POEM BY HIM ON THE DEATH OF HIS SON, MOTOHIKO, BEFORE PORT ARTHUR.

We mourn for him, the son, who lost his life
For his dear country on the battlefield;
Yet 'tis the father's heart that grieves us most.
Take thou his son—he's full of life and hope—
And use him as thy trusty bamboo staff
For serviceable aid in all thy work.

ON READING.

The jewel in a lady's coronet
Gleams in her hair, and sparkles in the gloom,
And yet 'tis naught—a sparkle, not a light.
The book whose page enlightens the dark mind
Is the true treasure.

In her love of poetry Her Majesty sets an illustrious example to the daughters of her realm. In verse she commemorates all occasions of national anxiety, of rejoicing and of sorrow; in verse she draws near to her people, and tells them of her love and compassion for them; in verse alone can she open her heart to them and show them that, like a beneficent and loving mother, she prays for their national and moral welfare.

Flower arrangement is a very fashionable accomplishment. Every girl of good family takes lessons in the art, and it is taught in most of the high-class schools.

In the middle of the last century we are told that as many as one hundred different schools or systems could be counted, out of which about ten are taught nowadays. Of these, three styles may be mentioned as the most popular—the Yenshiu, the Ikenobo and the Koriu. The Yenshiu and Ikenobo branches belong to the Formalistic, which aims at a classic idealism, and teaches a great deal of bending and twisting to give grace to the branches and leaves; while the Koriu may be said to belong to the Naturalesque school, which "accepts nature as

*Translations by Mr. A. Lloyd. See "Imperial Songs," translation by A. Lloyd, M.A.

its model, only imposing such modifications of form as conduce to the expression of artistic unity." In the Koriu style the superfluous leaves and sprays are simply cut away. The Ikenobo style, which is simpler than the Yenshiu (the more elaborate and artificial of the two), is that which is at present taught in the Peeress's School. The accompanying illustration of flowers arranged in the Ikenobo style will give some idea of the grace and simplicity of that school, the professors of which claim that the compositions look as if the flowers were growing in their own haunts.

Five years is the time needed for a thoro course in this art, taking a lesson regularly once a week. The massing of color and flowers is not aimed at, in fact the flower plays but a subordinate part in Japanese flower arrangement, "where the lines or directions taken by the different stems or branches form the basis of all compositions."* Every stem, leaf and blossom is coaxed or clipped or bent into symmetry according to the fixed rules of formal beauty.

A FLORAL ARRANGEMENT REPRESENTING HEAVEN, EARTH AND MAN

The principal and simplest of these is to symbolize the three elements of the universe—Heaven, Earth and Man—by three lines, called the Principal, Secondary and Tertiary. To represent Heaven (the Principal), the strongest and most beautiful branch or blossom is placed in the center; then on the right for the Earth (the Secondary or Subordinate) a line half as long, and on the left for Man (the Tertiary or Reconciling Principle) a line about one-quarter as long as the Principal. This completes one decoration. There are designs of five branches, seven branches and nine branches, but even numbers are never used. According to the different schools, different designations for the different lines are employed, such as Earth, Fire, Water, Metal, Wood, for a five-lined composition.

Strange as it may seem, Chinese philosophy has had an influence on this elaborate art. The Confucian ideas relating to the Positive and Negative or Male and Female elements of the universe control the selection of contrasting forms, the display of the front (Male) or under (Female) surfaces of the leaves, the disposition of the stronger and weaker branches, or stems, in their relation one to the other, and the choice of the colors of flowers. Red, purple, pink and variegated colors are termed Positive or Male; the blue, yellow and white are Negative or Female.

*See the "Floral Art of Japan," by Mr. J. Conder. This is an exhaustive work on this wonderful study, and one to which I am much indebted as a book of reference.

The expression of the whole beauty of plant life is aimed at "its floral growth and vitality." Even the way the plant springs from the water (which represents the ground) must be carefully studied and must show "stability and strength."

Masters of the art claim æsthetic virtues as a result of practising floral arrangement. "The idea is, that if the mind is influenced by anger, hatred or any other violent passion, flowers can never be successfully or gracefully arranged, but if the mind be tranquil, or only filled with kindness and love, then will the flower be satisfactorily arranged." One young friend tells me that she finds this true. Very often in arranging flowers they prove to be wilful and will not obey, but if she is herself amiable and patient then gradually the intractable flowers yield to her guiding fingers.

The utensils used in flower arrangement are a pair of scissors, a knife, a small saw, wedges or fasteners, called "bridges," to keep the flowers in their place in the water, and vases, of which the choice is innumerable, of all shapes, sizes and material. These may be of porcelain, iron, copper, or of wood, and even of basket-work—they may be square, oblong or round in shape, or standing, hanging or suspended.

The connection between the vase and the flowers is a study of harmonies in itself. Vases or receptacle, according to their shape and material, possess certain æsthetic characteristics, and, according to the selection of flowers placed in them, present choice abstract suggestions. For instance, Mr. J. Conder tells us that ten "artistic virtues" can be thus shown:

1. Simplicity.
2. Aspiration.
3. Affection.
4. Serenity.
5. Austerity.
6. Quaintness.
7. Brightness.
8. Chastity.
9. Security.
10. Veneration.

One "tea master combined a flower-poem on the Beauty of Solitude by the Sea with a bronze incense burner in the form of a fisherman's hut and some wild flowers of the beach."*

A pretty legend ascribed the first flower arrangement to Buddhist priests, who gathered storm-strewn flowers and to save them from perishing placed them in water. The art was certainly introduced into Japan with Buddhism in the sixth century; the earliest compositions, known as the "Rikkwa" style, being those placed on the Buddhist shrines as offerings to the departed spirits, which exist to this day, and which can be seen in all the temples. But the real "cult of flowers" was born in the fifteenth century with the tea ceremonies. It was, in fact, a modification of the primitive and more complicated Buddhist floral compositions instituted so as to harmonize with the austere and simple rights of the Cha-no-Yu when this reached the æsthetic stage.

"Ceremonial Tea" dates in its present form, like floral arrangement, from the fifteenth century. It may be described as the solemn and elaborate ritual of a cup of whipped tea. It constitutes the most formal and punctilious of social observances and is quite distinct from the ordinary serving and drinking of tea. Hideyoshi, often called the Japanese Napoleon, and Yoshimasa, were the greatest patrons of the tea cult, and Rikiu, a famous master, originated a special school of Cha-no-Yu, known as the Senke, and formulated the strict rules that are observed to this day. The Senke School of Tea has two branches, the Omote and Ura, which again has subdivisions, but tho there are small differences the principal rules are the same in all.

In learning the Cha-no-Yu there are two grades; first Usu-Cha or Thin Tea is taught and then Ko-Cha or Thick Tea. The last is the more complicated. The lessons are given six times a month and the course lasts three years. Every girl and woman of good birth must learn this polite art, which inculcates gentleness, kindness, extreme courtesy and conscientiousness between host and guest and *vice versa*.

The tea room is built of special woods and is so small as to only admit five people. The low door, only three feet high, thru which the guests enter, signifies humility. On entering "this house of peace" the samurai even left his sword outside.

Inside, the light in the room and

*Okakura Kakuzo. N. B.—Anyone wishing to know more of the philosophy romance and history of the Tea Cult and its intimate connection with the Floral Art of Japan, should obtain "The Book of Tea." by Okakura Kakuzo.

voices and comportment of the participants are subdued so that the singing of the kettle can be heard. The decoration of the room and the set of utensils used, tho often costly treasures, are of the severest simplicity. A kakemono, or hanging scroll, on the alcove, a vase of flowers, the acme of simplicity in arrangement, and an incense burner, are the only ornaments allowed in the tea room, but these objects of art are chosen with the greatest care and taste. Examination and criticism of these objects, as well as of the utensils used in the making of the tea, form part of the ceremony, which thus teaches art appreciation.

The guests in the waiting room next the tea room are summoned by the ringing of a gong. As soon as they take their seats on the mats profound salutations are exchanged. At the Peeresses' School the tea ceremony is taught by a lady of noble birth, who does it for her pleasure. She is assisted by a regular teacher. The pupils are given notebooks, where the rules for every detail of the minute preparations in the tiny kitchen attached to the tea room, from the preparation of the charcoal, which must be washed, to the order of the bringing in of the utensils and final rinsing and wiping of the bowl are carefully noted down.

The principal utensils used in this ceremony are:

A water jar.
A small bowl (used as a cup).
A bamboo whisk or beater.
A small cloth wrung in water.
A mamboo or ivory spoon.
A tea caddy of lacquer containing the tea.
A koboshi for emptying hot water from the tea bowl.
A small bamboo dipper or ladle.

In the room a round iron brazier, on which stands a round iron kettle, is placed on a stand, and there is a lacquer cabinet for putting away the tea sets. The tea used for this solemn and elaborate ceremony is ground to a fine green powder. At the right time this is put into the tea bowl—not an ordinary cup—by means of a dainty bamboo dipper, hot water is then poured into it, and the infusion is then whisked to a froth with the beater. The bowl of tea is then placed upon the left hand, and the host moves round slidingly and offers it in order of precedence to the first guest, who receives it solemnly with a profound bow. The tea must be drunk in three sips, and at this time the guest admires the bowl, which may often be a valuable piece of porcelain.

We read that the virtues of tea drinking were known in China before the fourth and fifth centuries, and it was used by the priest to keep them awake during their vigils. From China it came to Japan with Buddhism, for the Zen sect of Buddhists instituted the practice of drinking tea out of a bowl before the image of Bodhi Dharma, and thus laid the foundations of the tea ceremony. "The whole idea of teaism is a result of the Zen conception of greatness in the smallest incidents of life." From the religious stage the tea ceremonies developed under the patronage of Hideyoshi and Yoshimasa into a luxurious stage, and, finally, the esthetic form they present today was evolved.

The education of both men and women in Japan has been largely ordered by that wise and immortal sage Confucius, who said:

"There are two important things which should exist in a well-ordered society: *rei,* ceremonial, order; and *gaku,* music." It has been sufficiently shown what a large part ceremony plays in Japanese life, and now we learn that music is considered not only one of the most refined, but one of the most necessary accomplishments for woman.

"Harmony," says Confucius, "again has the power to draw Heaven downwards to the Earth. It inspires men to love the good, and to do their duty. If one should desire to know whether a kingdom is well governed, if its morals are good or bad, the quality of its Music shall furnish forth the answers."

Music is therefore considered not only one of the most refined, but one of the most necessary accomplisments for woman. Therefore, if it be intended that a girl should study music, she begins at a very early age, as soon as she is six or seven years of age.

There are three stringed instruments taught to a girl, the koto, the samisen and the kokiu. The koto is a horizontal sounding board about six feet long. Upon it are stretched from head to foot

PLAYING THE KOTO

thirteen strings, each supported by movable ivory bridges, by which the instrument is tuned. It is played by means of ivory finger tips fitted to the thumb, forefinger and middle finger of each hand.

The samisen resembles the guitar, but while the latter is round in shape, the samisen is square. It is made of quince wood or of red sandal wood, and over both sides of the body is stretched prepared cat's skin. The samisen has three strings made of silk which are played by means of a wooden plectrum.

The kokiu is a kind of two-stringed violin. It is supposed to have had the same origin as the violin and to have been brought to Japan by the Portuguese about three hundred years ago. The kokiu is played with a bow like the violin, but instead of being held under the chin is held vertically upon the lap by the left hand.

The samisen and kokiu are often used to accompany the koto, and when played together they are called "the musical trio" by the Japanese. The samisen is the most generally played by the people, but is considered not so "high toned" socially as the koto, which is deemed the classical instrument and from ancient times has been most in vogue among the ladies of the upper classes.

To become a proficient koto player it is essential that a pupil should pass three grades.

The first grade, "entrance to the study of music," is a course of two or three years of constant practice, taking lessons every day.

Second. The middle course is generally passed after another two years. Much naturally depends on the ability of the pupil. If she is slow she may not pass this stage for five years. Two or three hours of daily practising is required.

Third. "Entering into the secret of music," is generally passed one year after the second grade.

The pupil in playing sits in the orthodox Japanese fashion upon her knees and heels before the instrument with the ivory tips upon her fingers. At first the teacher holds the pupil's fingers and carries them from one string to the other,

teaching her the notes by ear, as no notation is used. The pupil, therefore, has nothing but her memory to rely on, and the constant practice of ear and hand. The lesson lasts only a quarter of an hour, as the teacher cannot give more than a few bars to be learned at a time. When the notes are learned, the teacher chooses a simple melody, and sitting opposite the pupil, plays on her own koto the piece over and over again, the pupil playing at the same time, till the tune is at last thoroly mastered.

There is a pretty story of old Japan in which the koto plays a part. The beautiful and accomplished court lady, Kogo-no-Tsubone, had won the favor of the Emperor Takahira. But to save her imperial master from annoyance thru the rivalry of her enemies, she fled the court and hid herself in the out of the way suburb of Saga, just outside the capital.

Thus deserted by his most faithful court lady, the Emperor was in despair. The courtier, Makakuni, one moonlight night, set out to seek Kogo-no-Tsubone.

After wandering half the night round Saga, his patience was rewarded—he heard the unmistakable strains of Kogo's music. The melody she played was "Longing for My Love."

He at last stopped his horse outside the gate of the house from whence the familiar strains proceeded, and taking out his flute, caught up the melody and played it to the end. Kogo-no-Tsubone was found thru her koto.

TOKYO, JAPAN.

The Wild Rose

BY MADISON CAWEIN

YOUTH, with an arrogant air,
  Passes it by:
Age, on his tottering staff,
  Stops with a sigh.

Here is a flower he knew
  When he was young;
Right in the same place, too,
  The woods among.

Fresh and fragrant as when
  He was a boy;
Still it is young as then,
  And full of joy.

Years have not changed it; no,
  In leaf and bloom:
It keeps its old-time glow,
  And the same perfume.

Time, that has grayed his hair
  And bowed his form,
Still keeps it young and fair
  And full of charm.

The root from which it grows
  Is firm and fit,
And every years bestows
  New strength on it.

Not so with him: The years
  Have taken much,
And care, and joy, and tears
  Have left their touch.

It keeps a sturdy stock,
  And blooms the same,
Beside the selfsame rock
  Where he carved his name.

His name?—He does not know
  It is his own,—
'Twas carved so long ago,—
  With moss o'ergrown.

He stops beside the flower:
  He feels its need:
And for a silent hour
  He gives it heed.

It beggars him, it seems,
  In heart and mind
Of memories and dreams.
  It is not kind.

It gives, and he must take,
  Thoughts old with pain,
And feel again the ache
  Of all that's vain.

If it could understand
  All it implies
Of loss to him who planned
  In life's emprise,

It would not smile at him,
  Nor flaunt its youth,
But set its thorns more grim,
  And wither of ruth.

He thinks: "Days come and go,
  And I am old:
This wild rose tells me so,
  As none has told.

"Had it not played a part
  In a love long past,
It would not break my heart
  With loss at last."

LOUISVILLE, KY.

The Flag of the United States

BY WILLIAM ELLIOT GRIFFIS, D.D.

Author of "Romance of American Colonization," "Pathfinders of the Revolution," Etc.

EUROPEANS knowing only the theory of the heraldic origin of the American flag have made merry over the absurdity (from their point of view) of the stars and stripes. Frederic Harrison has thus written (Memories and Thoughts, pp. 195, 196):

"When the thirteen States of the Union resolved to adopt a national flag from the ancestral coat of their chief," etc.—which they did not—they blundered frightfully. Than the stars and stripes, "nothing more artless, confused and unheraldrical can be conceived."

Harrison is right if the American flag be derived from English heraldry, in which the stars are always six-pointed. If, however, the basis of our national standard is derived from the Dutch Republic, then much is clear.

The American flag is not a lower limb of feudalism, nor does its blue field (it has no "canton") contain a collection of horse spurs. After the noble example of a federal republic, itself based on a written constitution, our national banner suggests more than a family coat of arms, or a league of states.

Asked to forget his nursery lore and to judge "Old Glory" simply "as a work of art," Mr. Frederic Harrison answered: "It is both awkward and ugly, unbalanced, undecipherable and mechanical." This is a correct answer, when the only medium of view is a ridiculous theory. If, however, our fathers followed in their flag-making what they themselves called "our great example," the successful Dutch Republic, the stars and stripes are beautiful, proportionate, intelligible, alive with historic meaning and inspiring for the future.

Paintings made after the Revolutionary War are untrustworthy as witnesses, especially those having six-pointed stars, for the very simple reason that no proof yet exists to show that any regimental flag in the Continental army had stars in its field, unless possibly toward the end of the war. Scores of British prints representing flags captured from, or seen on Continental ships or regimental staves, have only stripes.

Our fathers, of the thirteen colonies united as one, made "an appeal to Heaven" by uniting, on their first flag, raised at Cambridge, Mass., January 1, 1776, the "unions" of the two countries, Netherlands and Great Britain, that had held sovereignty of the land they lived on.

Out of what soil sprang this new flower in the garden of national emblems, in 1776? To answer aright, we must realize how our fathers felt, what precedents of success were before them, what ancestral memories stirred their hearts and what language, besides English, had long been spoken in the mid-colonies. Ships' flags would, of course, be noted first.

Of European national flags daily seen in our harbors, two were prominent above all. One, the Dutch, was made in 1579, the other the British in 1707. From 1609 to 1664, the tricolor republican flag of a federal union of states had floated over New Netherland, or the soil of the four middle colonies, later called New York, New Jersey, Pennsylvania and Delaware, as the flag of the homeland. The seven alternate red and white stripes recalled to our fathers, in 1776, the successful revolt against "taxation without representation," or, as the Dutch Parliament of 1477 put it, "no taxation without consent"; the union of seven states in a republic; a July declaration of independence, published in 1579; with the abjuring, in 1581, of an oppressive monarch. Both of these immortal Dutch documents were in the language vernacular to many of the people of New York and New Jersey. This striped flag stood for seven states particular united in one States-General, or Congress, and was used on ships invariably. Every stripe represented a state, each one having an equal vote. With a written constitution, a judiciary free from the executive, and public schools free to all and sustained by taxation, the Dutch republic, a living reality in 1775, was at many points our fathers' model.

How do we know this? By asking John Adams and Benjamin Franklin,

two men especially versed in history! John Adams wrote:

"The originals of the two republics [Dutch and American] are so much alike, that the history of one seems but a transcript from that of the other."

Franklin, who was at the time in the camp with Washington at Cambridge, wrote later to Congress:

"In love of liberty and bravery in the defense of it, she [Holland] has been our great example."

A Dutch orator voting to recognize and lend money to the Continental Congress ($14,000,000 when paid up in 1808), spoke of ours as a "nation so brave and so virtuous which, *after our example*, owes its liberty to its valor."

In a word, the emblems and the precedents of a successful republic, familiar thru history as read in their vernacular language, were daily before the eyes of the mid-colonials of America, in New York, New Jersey, Pennsylvania and Delaware, as a living example. Tho the law-language was English, preaching, writing and conversation in New York, and New Jersey and parts of Pennsylvania and Delaware were, for tens of thousands, in Dutch. The symbol of a striped flag, representing a federal republic, was familiar to every man of Dutch descent, and to most intelligent persons in the four middle colonies. It represented unity of idea and purpose in as many provinces, that had taken up arms for their rights. Borrowed directly from the Dutch Republic, the assemblage of parallel stripes had, in one form or another, always been a daily object to the people in the seaports, since their first settlements on the Hudson, Raritan and Delaware, over 150 years before. On the ships' flags, in church, guild and society emblems, and on the title pages of their Bibles, hymn books and family libraries, the seven stripes formed one of the commonest objects in the home. In the middle colonies, Dutch did not become a dead language till long after A. D. 1800.

The Continental Congress was organized on the same principles, and for the same purpose, as was the body of delegates forming the Union of Utrecht in 1579; that is, to have all the provinces or colonies act as one in carrying on measures of peace in the name of their sovereign. In the Pennsylvania "State House" (the very name and use of the words are Dutch), the Declaration of Independence was signed under the British flag and the arms of King George, and not until July 9 were the British union jack and the royal arms taken down from the building now called Independence Hall. Not until September 9, 1776, did Congress order that their "commissions and instruments be made to read "United States" where heretofore the words "United Colonies" had been used. They fully expected that the people in Canada would feel as they did and join them. This is proved by the vote of June 17, 1775, appointing George Washington to command of the Continental, or United Colonies army. The record reads:

"Whereas, the delegates of all the colonies *from Nova Scotia to Georgia* [italics ours] in Congress assembled have unanimously chosen George Washington, Esq., to be General and Commander-in-Chief of such forces as are or shall be raised for the maintenance and preservation of American liberty."

The stripes have never left the flag, because they represent a vital, fundamental idea. They have been from first to last the one permanent element in our national standard. When unfurled, January 1, 1776, the first Union flag raised over the first American army mirrored true history.

There was nothing new in this Continental flag. The vital elements composing it had been familiar objects representing the union of seven states in a republic; the one for nearly two centuries, the other, in the form then known, a union of four nations in a monarchy, for sixty-eight years. This flag at once gave the clearest possible acknowledgment of the sovereignty of Great Britain and of American loyalty, besides a superb demonstration of the unity of the colonists. The legal status of the thirteen united colonies was precisely that of the Dutch provinces in relation to their sovereign, during the 550 days from January 23, 1579, to July 26, 1581; when, having first formed the union, they deposed their king, when he refused to listen to their petitions for redress, and became independent.

Flags many, of astonishing variety of color, inscription and emblem came into view and use. There were pine trees,

rattlesnakes, beavers, threefold knotted cords, with their thirteen ends free, a chain or circle of thirteen rings linked together, and other objects notably American, with some borrowed from heraldry, or from British or Dutch history. In the latter case, the sheaf of arrows, the hat of liberty, and the Netherlands lion were ancestral. The old coins, flags, house pictures and battle scenes of the old Dutch republic in books brought from dyke-land were, in the four middle colonies, as familiar as was Dutch speech. Nevertheless, there was nothing as yet which necessarily inculcated, while much might suggest, independence; tho emblems of loyalty to King George became decreasingly visible.

Meanwhile, officers of the seventeen Continental men-of-war and of scores of privateers kept clamoring for something significant to display in foreign ports, especially while buying munitions of war. These calls for a "distinctive standard" increased in volume even to indignant remonstrance. Still there was nothing, until June 14, 1777, except local or colonial symbols and "the Congress flag" of the thirteen stripes; for there was not until after July 4, 1776, any nation, or any general conviction that independence was necessary.

No evidence of any use of the British "Union," after October 4, 1776, is known, for all thought of organic relations with Great Britain had been dropped forever. The Dutch idea of the unity of a number of states in federal union, which had excited William Penn's interest as the prototype even of a United States of Europe, was, however, kept and has been maintained to the present hour. Abundance of exact documentary proof shows that the thirteen stripes were ever present, but there is no proof that the stars were. In the book of photographs of extant flags used, or alleged to be used, in the American Revolution (made by Gherardi Davis, New York, 1908) the field of stars is rarely seen and in none with absolute surety, before 1780, but the stripes are always in evidence. The collection of British prints of our flag, now in Fraunces Tavern, gives the same testimony—stripes always, stars never till 1780. In the journal of William Russell, American prisoner in the Forton Prison, near Plymouth, England, we read the entry made on July 4, 1780:

"Today being the anniversary of American Independence, the American prisoners wore the thirteen Stars and Stripes drawn on pieces of paper on their hats, with the motto, *Independence, Liberty or Death.*"

The lateness of the date is significant.

The record of the Continental Congress, June 14, 1777, is illuminating. It reads as follows:

"*Resolved,* That the flag of the United States be thirten stripes, alternate red and white, that the Union be thirteen stars, white in a blue field, representing a new constellation."

Every word of this, our flag's charter, should be studied with care, for the record reveals what was old and what was new. There is no "canton," heraldry or feudalism here. A constellation is "a group of fixt stars to which a definite name has been given, but which does not form a part of another named group." Forty-eight constellations had been known in astronomy since Ptolemy's time. In the political heavens the cluster of thirteen stars was new. There was nothing novel about the red and white stripes, nor was a federal union of states, tho unknown in Great Britain, a new experiment, because the Dutch Republic was and for two centuries had been a contemporaneous, living reality before our fathers. The field of stars was new. No longer were there thirteen nameless, wandering planets forming part of another named group. They were now fixt luminaries, with a definite name, independent yet united together—*e pluribus unum.* Outliving the perils of loose confederacy, troubles internal and external, sectionalism, false theories, filibusterism, and a colossal civil war, this Country of the New Constellation has shown itself to be "an indissoluble Union of indestructible States," of which our flag is the true emblem.

When the infallible and contemporaneous record of a regimental flag with stars is found, we can believe that there were starry battle flags before 1780, but we want proof, not argument. The entry in the journal of Captain Abraham Swarthout of Colonel Gansevoort's New York regiment, written August 3, 1777, in Fort Schuyler, shows beyond cavil where the first flag of stars and stripes

of which we have record, was made and hoisted; but this was in a fort, not in the field, or at the head of a regiment.

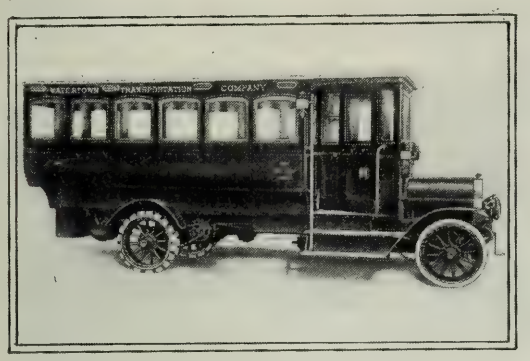
Hence, to put up local memorials in other places, insisting with much enthusiasm, but with faulty logic and without contemporaneous written proof, that because of the not yet published Congressional action, flags with a field of stars were made and carried *in situ,* by regiments or detached companies, is disorderly. Such a method substitutes mythology for history, wish for fact, local emotion for reality. The record should precede the memorial. Legislatures had better wait for demonstration of proof before making appropriations. A brilliant advocate's brief ought never take the place of commonplace record, nor "it is said" be accepted for "it is written." On some subjects we must wait for further light.

The vote of Congress on the flag was not officially published until September 3, 1777. There is no record that the stars and stripes were carried at Brandywine, Pa., at Gooch's Bridge, Del., or that even the "Quiberon" French salute of November 1, 1777, to the U. S. S. "Ranger," commanded by Paul Jones, was given to any but the striped flag without stars. If stars were on these flags, let us have "the written word" of proof, not argument however subtle.

On land, the most prominent of all the many symbols on the regimental flags of the Continental army thruout the war was the rattlesnake, which is oftenest referred to by both native and foreign witnesses. In fact the resolution of Congress of June 14, 1777, was not heeded, even by Washington himself, or even by the Board of War. One Continental officer wrote with surprise on August 3, 1777: "It appears by the papers that Congress resolved on the 14th of June last," etc. As late as May 10, 1779, Washington, in correspondence with the Board of War, states that applications came to him repeatedly for drums and colors, but there were many varying flags for particular regiments, and "it is not yet settled what is the standard of the United States."

The War Board replied, thru Richard Peters, that if "General Washington would favor the Board with his opinion on the subject as to what was the one common flag of the United States," a recommendation to Congress would be made and they would get the materials and "order a number for the army."

Replying on September 3, 1779, Washington says nothing about stars, but recommended that the number belonging to the regiments from each State should be "inserted within the curve of the serpent."



As our country expanded, the inconvenience of adding a stripe to what seemed destined to be a union of perhaps a hundred states was evident. The debate of 1817, held in Congress, issued in the arrangement of 1818, "calculated to prevent in future great or extensive alteration." The original number of thirteen was held to as signifying history, permanence and unity; while on the blue field there was prophecy, the white stars multiplying as in a firmament.

Nevertheless there being no rule as to the order of the constellation, foreigners were perplexed. In 1847 the Dutch Government politely made the inquiry, "What is the American flag?" In 1857, in the harbor of New York, nine different styles of arrangement of stars were noted in one day. On March 16, 1896, the Secretary of War, Daniel Lamont, ordered that the constellation should be in six rows. Happily with Arizona making the forty-eighth star, it is now possible to have symmetry in six rows of eight stars each.

To sum up: Our flag in origin was not "the sport of chance," or "a creation of circumstances," or a shoot from the stump of dead feudalism, or a fancy of heraldry, but a true symbol of a progressive, expanding union of states on the basis of a federal republic. It follows precedent in history, but is original in prophecy. Its stripes represent what was, its stars point to the future. With its origin so clear, there is no need of mythology, heraldry, or pretty fairy tales to account either for its origin or growth.

Each State, while honoring her own emblem of sovereignty, counts only one more sacred than her own—the Stars and Stripes. Above "Old Glory" Americans allow nothing to float save that church-flag, on our ships and in our forts, which calls men to worship "the Power that made and preserves us a nation."

Ithaca, N. Y.

Autobus vs Street Car

by

Philip Prescott Frost

DOUBTLESS every new agent of transportation since the world began has put an end to some time honored abuse, rudely upset some vested interest, and has paved the way for new abuses and for other vested interests. When the ancient horse-car turned trolley, some twenty odd years ago, and the competing trolley lines in our various cities consolidated into traction monopolies, it seemed to most persons that anything like competition in urban transportation was permanently dead. Attempts to restore competition by the establishing of rival lines soon convinced the doubters. If City Councils subservient to the existing companies deigned to grant new franchises, the competitors were soon absorbed and ceased to compete.

When it became evident that streeet railway transportation was a natural monopoly, and that it was not only in politics, but in control of politics, there began a fight in various cities to restore city governments and the city streets to the public which nominally owned them. We all know the outcome: failure.

Cleveland, under Tom Johnson, has brought its street railways, at least for the present, under the control of its city government. The fight for municipal ownership in Chicago has failed, the election of a street railway mayor five years ago having promptly resulted in wholesale renewal of franchises in return for a percentage of future profits. There is a show of regulation, but its aim would often seem to be to quiet rather than to serve the public. The monopoly is fat and secure.

To wrest these properties from their private owners at anything even remotely approximating their actual cost is impossible; to buy back franchises freely given at their capitalized valuations would be pointless and silly; to attempt effective regulation is to attempt a certain measure of confiscation. The franchise is a bargain, a contract. That it is an exceedingly bad bargain for the public makes no difference. The manner in which it was obtained makes no difference. It is, at least nominally, binding on the companies and must therefore remain binding on the public, even after the aldermen who granted it and the voters who elected them are dead, if it have so long to run. This is good law, and there is even a point of view from which it can be made to look like justice. But it is not the last word. What the law cannot do, evolution in transportation methods suddenly threatens to accomplish.

At about the time when the trolley was displacing the horse the first ungainly bicycle appeared. The bicycle developed the pneumatic tire, the pneumatic made the "horseless carriage" popular, the automobile grew in size and weight and power until it bred the motor truck, on solid tires again, and the motor truck having captured the short haul express business suddenly dons a passenger body and, as motor bus or autobus, enters into competition with the street railway, long believed to be secure from competition.

The street railway's franchise has become a disadvantage. Its privilege has become a duty. The trolley must stick to its own street, but the motor bus goes where the business is, asking no leave of any one. If a street railway imperfect-

ly serves the streets it traverses the autobus may compete, following the same route and taking passengers as they wait on the corners for cars, even traveling on the rails which the street car company has laid down and must keep in repair. If some special event or attraction makes desirable a temporary change of route to take advantage of a temporary transportation need of the public the autobus alone can accommodate itself. The desirable residence street which refuses to permit the defacement and inevitable depreciation in property values inherent in trolley rails and overhead wires is freely open to the motor bus. If a route proves upon trial to be unprofitable the bus may seek a new one which will pay better, and no equipment need be abandoned in doing so.

The street car company collects what its franchise permits it to collect. Motor routes charge what they will and alter their charges at will. The Meridian street bus line in Indianapolis collects a ten-cent cash fare, or sells tickets in quantity at a rate which brings them slightly below five cents each. In Chicago the bus fare is a nickel. In some places there is a flat rate of ten cents, but at present the tendency seems to be toward the nickel fare.

The motor route is not, necessarily, a common carrier, and in some places this is an advantage. The Indianapolis line already mentioned traverses a residence street for two and a half miles out and back from the center of the city, with a competing street car line on either side of it only one block away. The laborer with large accumulations of mud where feet would normally be looked for, and the lady of color, with a washing for delivery, are excluded.

An autobus line can never be "tied up" by accidents. Every city dweller is familiar with the broken down coal wagon on the track, the long line of waiting cars, the exasperating delay. We have all stood on a corner waiting for half an hour, only to have the first two or three cars pass us at a forty mile clip making

"IT CHEERFULLY DEPOSITS YOU AT THE CURB"

THE AUTOBUS CAN NEVER BE BLOCKED

up time. Some lines, owing to poor equipment, notoriously "run in flocks." The autobus line, on the contrary, can never be blocked, even by the total closing of the street it normally traverses. If a machine breaks down the next behind takes its passengers and goes on. Each driver has a clock before him, a schedule to maintain and a clear track. One learns to expect the motor bus when it is due.

From the standpoint of the public the autobus is altogether good as compared with the street car. It cheerfully deposits one at the curb in bad weather instead of the exact center of some mudhole. It has even been known to halt in mid block to accommodate passengers. Quiet, comfortable, dependable, it makes friends wherever it is introduced.

One advantage the street railway franchise still possesses, however. For years it has been accepted by bankers as a thing of such value in itself that bonds based upon it are considered to be amply secured. The street railway magnate organizes his company, obtains his franchise, and then with little or no actual investment in the business issues his bonds and borrows the money to build and equip the line. Everything above six per cent. profit on the investment goes to the promoter for dividends on an issue of aqueous stock, held by himself or by "innocent" investors to whom he has sold it. If the line fails to pay it is thrown into the hands of a receiver and he, having risked nothing, escapes without loss.

With the motor route, on the other hand, there is "nothing to capitalize." It is useless to try to explain to your banker that the motor bus has an inherent right to do everything that the franchise grants to the street car, and that, too, without vexatious conditions. It is useless to plead that the equipment itself is adequate security for at least a part of its cost. It is useless to present arguments or figures to show that the line will pay. He will be courteous—but firm. You will get nothing. At the present time credit is not extended to the motor route.

The motor route is a place to invest reasonable amounts of real money with good prospects of a comfortable return. It is not, and probably never will be, a stock jobbing proposition like the street railway. The exclusive monopoly right to the territory is lacking, which has been the advantage of the franchise holder in the past. This disadvantage of the independent bus line may, however, be neutralized as competition grows

sharper by a lessening demand for street railway securities not backed by real values.

Meantime there is nothing to prevent any man, possessed of the necessary ready money, purchasing his machine and starting out in the passenger carrying business for himself, either in competition with an existing motor route or street car line, or on a new route of his own. It is a cash business and only a comparatively small working capital is necessary.

Any motor truck chassis may be fitted by a body builder with any desired type of bus body, within the limits of its weight carrying capacity, the price to the investor being that of the chassis plus that of the body. Bus bodies cost from $1,100 to $2,000; complete cars from $3,300 to about $7,000. Several companies already supply a standard body fitted to their chassis, electric lighted outside and in, with hot water heat, adjustable windows, ventilators, push button signals to the driver, fare register, and even straps for the prospective strap-hanger. One thirty-four passenger car is equipped with motor air brakes, and has a rear platform where a real conductor takes your fare. Most motor bus bodies are arranged to be entered at the front, where the driver may collect the fares, this type being known as the "pay-as-you-enter." The weight varies from two and a quarter to four tons, empty, and the maximum speed from twelve to twenty miles per hour. A line like that on Meridian street, Indianapolis, may be equipped with rolling stock for about $30,000.

As to cost of operation it may be said that neither the street car or motor bus has any decided advantage. Counting interest on the investment, sinking fund, depreciation, insurance, repairs, cleaning, cost of power, either electricity or gasolene, wages, and in the case of the street car maintenance of way, each works out at a shade less than $20 a day. The motor truck makers' estimates run from $10 to $16 and are obviously low, while companies operating motor routes are reticent. A line in Chicago, however, furnishes cars for temporary service on a guaranteed $20 a day basis, a figure which undoubtedly includes a comfortable profit. As will be noted, this calls for the carrying of four hundred passengers per day on a five-cent fare basis.

ANY MAN WITH THE PRICE OF A 'BUS MAY START A LINE OF HIS OWN

A MINIATURE STREET CAR WITH REAR PLATFORM AND CONDUCTOR

Night and morning "rush hour" business alone will hardly justify the starting of a motor route. The motor bus is not designed to accommodate the excessive overcrowding of the trolley car.

It is interesting to note that motor trucks in freight service are often worked twenty-three hours out of the twenty-four, with three shifts of drivers and crews, for three hundred or more days in the year. Economy demands that these machines be kept at work at full capacity when there is work to be done. It has been suggested by one motor truck company that, as their bus body is readily detachable from the chassis, a twelve or sixteen hour a day passenger business with the bus might profitably be alternated with a night shift with freight body for interurban express business. The bus body would be available for cleaning during the night, the freight body could be unloaded and loaded during the day, and the chassis would work almost continuously. For the gasolene truck such service would be no hardship, and the electric would find it easy on two sets of batteries.

The autobus is already passing the stage of experiment and street railway interests here and there begin to feel the pressure. In one city the interurban lines are reported to have lost $85,000 of business in one year to motor routes, and to be moving toward the establishing of autobus feeder lines of their own. In the suburbs of Chicago the president of the County Traction Company has offered an auxiliary electric bus service as a reward for "satisfactory" franchise renewal—a renewal made doubtful by the success of a newly established competing motor route.

Buffalo, Cleveland, Indianapolis, Chicago, as well as many smaller places, are experimenting with the machines, and in many places they have passed beyond the stage of experiment. In Paris the autobus is an old story; London is said to have $20,000,000 invested in the business; the Fifth Avenue line in New York is long established and well known. As the present motor bus develops into a heavy passenger vehicle more perfectly adapted to its purpose, and as credit comes to be extended more freely to it, the trolley must, it would seem, more and more be crowded off the streets into exclusively long haul interurban work. With the street car rail must also go the franchise, a most prolific source of municipal corruption.

Evanston, Ill.

Our Restless Waiters

BY LOUIS WINDMÜLLER

Treasurer of the Reform Club of New York.

OPINIONS about the value of labor are bound to differ; more people wait on others, than are waited upon, and dissatisfied waiters have found more sympathy than their inconsiderate employers.

During frequent journeys here and abroad the writer often had to exercise patience in waiting for the food he was obliged to order from negligent servants. In many cases he has bolted a meal in less time than it took the attendant to fetch it. In dining cars, the service is poor unless the attendant, when he accepts an order, is confident of a fee.

Waiters are paid by their ostensible employers less here than they are paid elsewhere, because our system of fees is not regulated as well here as it is in older countries.

In France, in many parts of Germany, and Switzerland, it is the custom to hand 5 per cent. of large amounts, 10 per cent. of small accounts, to the attendant who has served you well. These receipts are generally placed by the head waiter into one receptable together and when the day's business is over the aggregate is divided among all waiters, share and share alike.

Such a rule has been most rigorously adopted in Austria, where only the "Zahlkellner," as he is called, is permitted to collect money. There are guilds of waiters as there are of other professions in the old countries. Anybody who has not the certificate of some reputable hotel keeper, that he has served as apprentice his full time to his employer's satisfaction, would not dare to apply for a waiter's position in any first class hotel.

This custom is almost unknown in this country. When our hotel keeper needs help he will engage any decent looking individual, whose dress is presentable.

In some of our best hotels the writer has been well served by former college professors and military officers of high rank who graciously accepted their fee like other waiters.

Wages from $25 to $40 are paid and accepted here in the expectation that a sufficient amount in fees will reimburse the recipient for the value of his services. When these expectations are not realized the waiters' dissatisfaction is justified. In many cases waiters are treated by their superiors like scullions. In some places they must pay for crockery they have not broken, and are fined for sins they have not committed.

If waiters were paid what they deserve by their employers, and if patrons were to abstain from bribing them, there might be less occasion for dissatisfaction. But even if waiters were so remunerated there will always be some guest who wants to be better served than his neighbor and who will bribe his attendant. The writer has seen men who, at the beginning of a banquet, passed a dollar bill to their waiter, and repeated such an unmerited fee until the dessert was served. No wonder that waiters pay for the privilege of serving such arrant fools.

The best paid hotel servant in Europe is the "portier," or "concierge." Dressed in gaudy uniform and stationed at the entrance of the hotel, he is a pompous individual, too proud to look after the luggage, a duty which is left to the actual porter called "Hausknecht." The portier has always money to lend; sometimes he takes a mortgage on the building.

Women waiters, especially in France, understand the art of begging better. The writer had ordered a fire and breakfast in his room before his intended departure. After the pretty maid had arranged everything to his entire satisfaction she stepped up to his couch and asked in a sweet voice with insinuating gesture, "Monsieur desire encore quelque autre chose?"

In German restaurants where food is good and wine is cheap the attendants could not always serve the crowd of hungry guests. The writer has more than once gone with friends to fetch wine from the cellar and meat from the kitchen. He had to pay no fee to serve this meal and enjoyed it all the more.

New York City.

Literature

Improving City Government

THE muckraking of American cities, which for some time monopolized attention, is now in part superseded by more constructive criticism. Yellowish magazine articles, compact of vivid adjectives and moral indignation, have given place to scientific surveys, full of indisputable facts and academic moderation. For frothing denunciation of base politicians and their robber ways is substituted an examination of faulty forms of government and the sources of corruption. Recurrent spasms of horror at city wastefulness have yielded place to enthusiasm for bureaus of efficiency and better municipal accounting.

Of this transition the volumes before us are an evidence and an outcome. All three indicate deep discontent with city conditions; each supplies a prescription toward a cure. The patient is so sick that one remedy will not suffice. The open window of investigation to let in sunshine and air to the sick city must be accompanied by a better daily regimen, and self-examination for health and efficiency; while, equally important, the franchise debauches, so exciting and enervating, must be totally renounced.

Mr. Kenngott has made, in his thesis, in part fulfilment of the conditions for the degree of doctor of philosophy, such a survey of Lowell, Mass., as commands the respect of non-academic persons.[1] No greater praise can be given the book than to say that it is worthy of comparison with that survey of London made by Charles Booth, which was father to the whole brood of these investigations. Lowell is depicted in its work, its play, its worship; its habitations and its stores, its standards of life, its industrial conditions, its cosmopolitan population—all are displayed with accuracy, with thoroness, and with historical perspective. Like other surveys of American cities, this survey reduces our pride in "triumphant democracy" and challenges to fresh struggle for social justice. Tho "the condition of the skilled workman has improved" in recent decades,

> "especially when he has been able to own or rent a house away from the center of the city, thru the introduction and expansion of the electric railroad service, the condition of the unskilled laborer speaking a foreign tongue, living an alien life in old and unsanitary tenements in the congested districts, is pitiable in the extreme, the more so because many of them know and desire nothing better."

Tho the government of Lowell was not specially probed, the author's reference to the influence of street railways on the workman's standard of life illustrates how intimately the franchise question concerns the wage earner. Dr. King's volume[2] is an argument, cogent, measured, well balanced, for the public regulation of such municipal utilties as gas, water, electric lighting and street railways. He has collected the most significant papers read since 1894 at the annual meetings of the National Municipal League and has added to them sound fresh material on the problem of ownership versus regulation. Altogether, the volume is valuable for its historic accounts of the struggle for municipal freedom and fair franchises in a number of cities, for its unprejudiced narrative of the way public service commissions have tackled their work, and for its dispassionate arguments upon the types of control available. On the whole the argument harmonizes with the contemporary tendency in favor of regulation as equally effective and less dangerous than public ownership. Each case must be judged according to all the conditions surrounding it. No general rule universally applicable can be formulated. Where a city government is either dishonest or crassly inefficient and a public service commission is at work, regulation will yield greater benefits than ownership; where a city government is alert and trustworthy, and the franchise corporations corrupt and defiant, ownership may bring greater advantages.

[1] THE RECORD OF A CITY. *By George Kenngott.* New York: The Macmillan Co. $3.

[2] THE REGULATION OF MUNICIPAL UTILITIES. *By J. L. King.* New York: D. Appleton & Co. $1.50.

Whichever system is approved, regulation or ownership, a scientific system of accounting, and organization for efficiency, are essential to success. This efficiency—what it is, why it is essential, how it can be attained—is discussed with amplitude in the new volume of the *Annals of the American Academy of Political and Social Science.*[3] The volume is addrest chiefly to experts and officials, for it presents in detail how efficiency has been established in the different bureaus of several cities and quotes copiously the forms, the ledger requirements—all the paraphernalia, so wonderful in complexity—which go to bringing a city's bookkeeping up to date. Too much is claimed for these improvements. But every improvement is worth while. A perusal of the other volumes will balance the reader's views and keep him from imagining that ledger entries are the sole tests of progress. Many factors affect city efficiency, and never will government be able, no matter how elaborate its office systems, to dispense with the upright and able officer, the exponent of the old-fashioned virtues of industry, integrity, and patriotism.

Japanese Painting

In its best estate Japanese painting is an art of idealistic exaltation. By the long-accepted canons the painter's choice of subjects for pictorial treatment was rigidly restricted within a rather narrow range. Yet for the masters this very poverty in subjects was a source of wonderful strength. They valued workmanship, or the right use of material, rather than the material itself; instead of style and design, they prized the intellect and atmosphere; and with a skill equaling their astonishing economy of means they created works of rare and compelling beauty. This was before the Western ideas of art had invaded Nippon, since which time Japanese painting has suffered a sad decline. But the older and better Japanese art has influenced to their gain many of the best Occidental painters of the last half century, and it still offers most valuable lessons for all who are willing to learn them. So, in setting forth in good English an intimate and practical account of the traditions and procedures of Japanese painting,* Mr. Henry P. Bowie has done a real service for a far larger number than the comparatively few who are primarily students of that particular art.

The book is unique in that it is from the pen of a foreigner, who, besides studying Japanese methods, has also mastered their application. For nine years Mr. Bowie lived in Japan, studying and working with several of the best modern Japanese painters, and he won artistic distinction among them even to the extent of carrying off high awards at their exhibitions and having examples of his work acepted by the Emperor. Clearly and vividly he has compacted into a volume of moderate size a bulk of information the equivalent of which could only be gathered from a score of other books, and some of which has not been accessible except in the Japanese language.

"A Japanese painter is long in making," he says. "From ten to fifteen years of continuous study and application are required before much skill is attained." Somewhat in the manner of the European Renaissance, mastery is attained thru humble discipleship. But besides the training of hand and eye the training of the soul is even more characteristic. Every painting must conform to the fundamental rule of containing a primary and a secondary interest, a positive and a negative motive. Always there must be clear thinking and feeling, but thinking and feeling must not impair the spontaneity of the inspiration or the power of the brush stroke. The artist must induce within himself certain states of consciousness corresponding with the subject of his picture. He cannot rightly place a dot within the eyeball of a tiger unless he feels the savage character of the animal. He must not only understand the spirit of nature, but he must make it momentarily his own. In making certain angular strokes to represent armor or other stiff materials the painter is bidden to feel as if he were engraving with a point on

[3] Efficiency in City Government. Philadelphia: Academy of Political and Social Science. $1.

*On the Laws of Japanese Painting. An Introduction to the Study of the Art of Japan. *By Henry P. Bowie.* Illustrated. San Francisco: Paul Elder & Co. $3.50.

metal. A picture may seem to be perfect, but the master will recognize that at the time of its execution the artist had failed to induce in himself the appropriate state of consciousness. This psychological basis of Japanese painting Mr. Bowie explicates more clearly and concisely than any other who has yet written in English on Japanese art. Many carefully chosen and excellently reproduced illustrations and explanatory plates add greatly to the value of his delightful book.

Maria Theresa. By Mary Maxwell Moffat. New York: E. P. Dutton & Co. Pp. 382. With 22 Illustrations. $3.50.

With most of us the name of Maria Theresa conjures up a series of European wars connected with the Pragmatic Sanction and the ambitions of Frederick the Great. Miss Moffat has not altogether neglected the wars; she surrenders occasionally to the delights of describing military events with all the professional understanding of a field marshal or a chief of staff. But, much to the advantage of the book as a biography, she has subordinated these and other aspects of the reign—the confused diplomacy, the educational, judicial and financial reforms—to the unfolding of the remarkable personality of the Empress-Queen as seen in her daily life and her intimate family relationships. Maria Theresa was an assiduous worker. She rose at five in the morning, greatly to the discomfort of the young ladies whose honorable servitude at court required them to prepare her apartments beforehand and help her to dress. So occupied was she with the business of state and the care of her sixteen children that she even lunched alone to avoid loss of time. Her husband, Francis of Lorraine, having little else to do, made conquests among the ladies of the court. She loved him, but was not blind to his shortcomings; and when he (being an Archduke, tho no heaven-born military genius) led the Austrian armies, she was careful to keep his reputation safe under the reflected glory of her general, Khevenhüller. Such details serve, not only to reveal the character of Maria Theresa, but also to give a faithful picture of the eighteenth century despotism. Miss Moffat writes easily and with some sprightliness. Her work is evidently based upon a painstaking study of the sources, including manuscript documents in the imperial archives at Vienna.

"TREE SQUIRREL"
BY MOCHIZUKI KIMPO
From Bowie's "Laws of Japanese Painting"

A Negro Explorer at the North Pole. By Matthew A. Henson. New York: F. A. Stokes Co. $1.

Commander Peary has frequently been asked why, among his many companions, he should have selected Matt Henson, a negro, to assist him in the final dash to the North Pole. Commander Peary has replied that Henson had been his trusted assistant for over twenty years, and the position of honor was accorded him primarily because of fitness for the work and because of his loyalty. The personal reminiscences of Matt Henson make interesting

reading. He was born in Maryland, and after leaving school shipped as a cabin boy on a vessel bound for China. He visited, during four years at sea, Japan, Manila, North Africa and the Mediterranean countries. On his return, he accompanied Commander Peary to Nicaragua as body servant, and from that time has always been a member of his expeditions. The fortitude and perseverance of Henson are a credit to his race. In his introduction to this book, Commander Peary speaks of the fact that this son of the tropics has proved his ability to stand the fiercest stress of cold and exposure, while the inhabitants of the North, tough and hardy as they are, succumb quickly to a warm climate. The account of Henson's experiences is written in a straightforward and unpretentious style. The book is a good companion work to George Borup's "A Tenderfoot with Peary," issued in uniform style by the same publishers.

The Reminiscences of James Burrill Angell. New York: Longmans, Green & Co. $1.25.

President Angell's reminiscences are much less copious than we could have desired. They are graceful and entertaining, but they could not well have been otherwise. They embrace numerous episodes in his public and diplomatic service, and are not without historic value. But they are so modest and so impersonal that they only hint at the matters that they might have illuminated. It has not been the fate of every man to preside over the most novel and significant experiment that the United States has ever tried in education. The State university was little more than a name when Mr. Angell went to Michigan. It had become an imposing reality before he left his office, and the men and women trained by him have made over popular education to meet the need of modern America. We should have been glad to have a light upon this creation from within. But in its absence we must be grateful for the slender volume he has written. Perhaps his most interesting story has to do with the sympathy of Turkey for the United States, which he found existing when minister at Constantinople during the Spanish War. He inquired into its cause, only to learn how slow-moving are the emotions of the Turk. "Don't you remember," said his informant, "that three hundred years ago these Spaniards drove the Mohammedans out of their land? Allah is great. The time of punishment for them has come."

The Cambridge Medieval History. Volume I: The Christian Roman Empire and the Foundation of the Teutonic Kingdoms. Pp. xxii, 754. New York: The Macmillan Co. $5.

The success of the "Cambridge Modern History" has led naturally to the preparation of a similar work covering the medieval period. Hitherto students have been dependent on Lavisse and Rambaud in French, or Heeren and Oncken in German; they will now have a superior authority in English which will give a summary of ascertained facts and sufficient indication of controverted points to serve as a guide for further reading. There will be eight volumes, two coming from the press each year. The formulation of their general plan has been entrusted to Prof. J. B. Bury, who succeeded Lord Acton as Regius Professor of Modern History at Cambridge; the editing to Profs. H. M. Gwatkin and J. P. Whitney, who are both in clerical orders and who show some disposition to overemphasize the influence of Christianity in the development of Western society. Altho the editors do not tell us why, they have regarded the Middle Ages in the old sense, as beginning with the Goths and ending with the printing press and America; Professor Gwatkin talks mysteriously about "ancient elements" and "medieval elements" without vouchsafing us any definitions. The first volume covers the two centuries following the accession of Constantine. The contributors, several of whom are Frenchmen and Germans, are for the most part recognized experts in the fields which have been assigned to them. They show no trace of the esoteric manner which historians used to affect when dealing with scanty and conflicting materials. For the purposes of the general reader this sifting of evidence and the occasional absence of a coherent narrative may be rather confusing; but he who turns from Green's

"Making of England" to the pages written by Mr. Beck will experience a wholesome shock. Professor Vinagradoff's short chapter on social and economic conditions is perhaps the best in the volume; but its brevity goes to show that the old and limited view of the function of history is dying a slow death. The bibliography, which occupies 80 pages, is careless and unintelligent. No attempt is made to indicate the relative value of secondary writers. Some of the fourteen maps will be found very useful.

Miss John Bull. By Yoshio Markino. Pp. 166. Boston: Houghton Mifflin Co. $1.50.

Mr. Markino is an artist, and has illustrated this unconventional volume both in pen-and-ink and color. He is very clever at this, and no less clever in his criticism of English women—viewed from the standpoint of a resident of their country during some fifteen years, but yet an Oriental. His Oriental canniness appears in everything, even his quite conscious use of what the publishers assure us is "quaint and picturesque English." Undeniably the inversion of phrases and the studied irregularity of both style and syntax lend an exotic quality to these sketches, but some discriminating readers will wish that Mr. Markino had used the best and simplest English he knows, and not a kind of "Japanese schoolboy" jargon. We find the impressions the artist records good enough, or diverting enough, to have been exprest in something better than studiedly naïve Markinesque. Charm he does all the same communicate. And Mr. Markino is a fairly genial critic; especially he admires British children, schoolgirls (so far as he knows them) and sportswomen. He wishes Englishwomen would not follow French fashions, but would "create some graceful dresses . . . to show their own dignity." He wishes they would not dance in what he calls "this mermaid dress"—familiar now as the hobble. What he says of the Occidental and Oriental views of social dancing is ex-

ceedingly amusing, and not a bit less enlightening. He tells, too, of being much shocked as a boy in a missionary college at seeing "those missionaries kissing each other's mouth in front of the public." Certainly missionaries should learn and respect native custom—where it is respectable! But don't suspect that Mr. Markino is a reactionary. On the contrary, he is a suffragist. What tho his chapters on suffragets are his dullest ones? The volume interests us less as an exposition of Englishwomen than in partly revealing one Japanese mind.

BROAD STREET, OLD LYME
From Bickley's "Where Dorset Meets Devon" (Dutton)

Where Dorset Meets Devon. By Francis Bickley. Illustrated by J. W. King. New York: E. P. Dutton & Co. $2.50.

A delightful volume is that of Mr. Bickley on that part of his native country where Dorset meets Devon. For this we have Mr. King to thank, in part. His black-and-white work has color and warmth as well as picturesqueness, and he hits the mark almost every time, so that it is hard indeed to decide which one of his charming sketches to reproduce. Mr. Bickley, for his part, is equally at home in reminiscence, anecdote and literary allusion. Like the illustrator, he loves the winding streets, quaint windows, thatched roofs and square church towers of Old Lyme and Charmouth and Axminster; he loves both sea and shore. Can we do better than spend our holiday in England, after all?

Myths and Legends of California and the Old Southwest. Compiled and Edited by Katharine Berry Judson. Pp. xv. 193. Chicago: A. C. McClurg & Co. $1.50.

As in the case of her earlier volumes, which present the myths and legends of the Pacific Northwest and Alaska, Miss Judson has not written for a limited class or for a scientific purpose. Choosing only the simpler, quainter stories and putting them into a form which should appeal widely, she has, without sacrifice of accuracy or truth, discarded involved conversations and ceremonial details which would be without any charm and which would interest only the ethnologist. In her style there is simplicity and directness, and, not infrequently, poetic beauty. More than fifty photographs adorn the volume, some of them of rare perfection.

Literary Notes

....As invaluable as ever is the *Statesman's Year Book,* the forty-ninth annual issue of which comes to us from the Macmillan Co. (pp. 1428; $3).

....Mr. Fisher Unwin, the London publisher, is issuing a shilling series of Irish plays, the first two volumes being Mr. Yeats's *Countess Cathleen* and *The Land of Heart's Desire.*

....Henry Holt & Co. have issued a new and enlarged edition of the *Illustrated Key to the Wild and Commonly Cultivated Trees* of the Northeastern States and adjacent Canada. Every tree has at least a leaf figured and often the bark. It is an admirable and very useful little book and is a real guide ($1.35).

...."That interesting Frenchman, Comte de Grammont, is accredited with saying that during his residence in England he knew but one woman in Whitehall who was both beautiful and pure—Frances Jennings." This marvel Charles Major makes the theme of his latest romance, *The Touchstone of Fortune* (Macmillan; $1.25), in which the quarrels and intrigues of the court of the Merry Monarch are told by a contemporary in a manner worthy the author of "When Knighthood Was in Flower."

....There are much valuable advice and information in *Working One's Way Through College,* by Calvin D. Wilson (McClurg; $1). That it contains a list of seventy possible remunerative undergraduate occupations at Harvard gives some idea of the wide range of opportunities offered. One man at Harvard earned $1,331 during term time in four years, and another $225 above expenses in a single vacation. A discussion of the opportunities offered at West Point and Annapolis is included.

....*The Conquest of Nerves* (Macmillan; $1.25), by J. W. Courtney, M. D., is correctly styled "A Manual of Self-Help." The author believes that, once the nervous system has become functionally deranged, there is no mental by-path to the recovery of health marked by such polysyllabic signs as "autosuggestion," "psychotherapy," and "subliminal self." Nevertheless he has a good word for Emmanuel methods and holds that "Christian Science" has back of it some common sense suggestions that give it whatever value it has. But he points out the fact that their cures are wrought thru the agency of self alone, and he outlines a course by which the sufferer may regain his self-mastery without the loss of his own respect or that of others.

....Mr. Stanley Washburn's account of his adventurous search for news along the shores of the Black Sea during the Russian revolution of 1905 is a tale of *The Cable Game* (Sherman, French & Co.; $1.25) well worth reading. The risks and ruses to which a war correspondent must sometimes resort to carry his point and secure both the news and its early publication are described in many lively incidents. His experiences on the chartered tugboat in Turkish waters make an exciting story when it is not humorous.

....The stern and simple life of the Labrador coast has its hardships and monotony only now and then broken by adventure, but it has a fascinating interest when seen thru the eyes of a man like Dr. W. T. Grenfell. In his volume entitled *Down North on the Labrador* (Revell; $1), Dr. Grenfell gives chapters from his own experience that light up the moral struggles and tragedies, the toil and adventure of that desolate region. The stories have all the attractiveness of charming style and a keen appreciation of dramatic incidents.

....Mr. Ramsay Benson's *A Knight in Denim* (Scribners; $1.25) raises the question whether one noble purpose pursued with singleness of thought does or does not lift a man from idiocy into a singular wisdom. Bill Harbaugh, the knight in this tale, makes it his aim to save women from the horrors of Western farm life. Mr. Benson is particularly gifted in leaving the reader in doubt as to whether his various heroes are whimsical idiots or great humanitarians removed beyond the understanding of a blind generation.

....We sometimes doubt whether it is a compliment after all to be likened in literary style to Mrs. Wharton. What it means is that in a book of that quality there is a deal of introspection and little outward action. Willa S. Cather's *Alexander's Bridge* (Houghton; $1) is the story of an engineer of note. It analyzes a double-headed lover, and just when the man is tortured most, he meets his death on one of his own bridges. Psychologically there is some feeling to the story. There is also some good writing. But, as a novel, it all seems rather futile.

....The first attempt to cast the story of the peace movement in the form of a school text book for young people is *The Friendship of Nations,* by Lucille Gulliver, A. M. (Ginn; sixty cents). Miss Gulliver has made exhaustive researches for her material; no incident or argument, past and present, that bears on her theme, seems to have escaped her. The book, tho something of an *omnium gatherium,* should do much to promote th

sentiments of international justice and fraternity among the youth of the land. Numerous illustrations and an introduction by President David Starr Jordan embellish the work.

....The Reverend Warren H. Wilson has written an excellent handbook on *The Church of the Open Country* (Missionary Education Movement; 50 cents), in which the reciprocal effects of religious and economic conditions in rural communities are duly emphasized and illustrated by the history of general movements and the experience of special localities. Recent economic and social changes which necessitate corresponding modifications in the organization and efforts of country churches are described with sufficent clearness to give point and weight to the author's suggestions looking toward more perfect adaptation and an enlarged sphere of usefulness. The book is practical, hopeful and well grounded on facts.

....To the list of educational books on astronomy noticed in our issue of May 9 we may add another compend. *Astronomy in a Nutshell,* by Garrett P. Serviss (Putnam's, $1.50). The reader—or student, rather—will find here a plain and compact statement of astronomical theory and fact, colored and varnished with no useless rhetoric to tickle the fancy and excite sentiments of wonder. The only touch of fine writing we have discovered is the characterization of the Milky Way as "a softly shining baldric encircling the heavens." There are illustrations, particularly of nebulæ.

....We receive from Henry Holt & Co. several additions to their Home University Library. *Reconstruction and Union, 1865-1912* is a contribution to the bookshelf of history by Dr. Paul Leland Haworth. Inevitably a summary style is demanded here, which, in the final chapter, "The Revolt against Plutocracy," means that the writer's prejudices and partisanship seem to distort his record and to destroy the just balance which historians should aim to maintain. But "history" is rather too impressive a word for this little volume. Mrs. Rhys Davids, M. A., an English contributor, writes in *Buddhism* a sympathetic "Study of the Buddhist Norm, skilfully threading the mazes of Indian thought involved in the Pali Canon. Logan Pearsall Smith tells in 250 pages something of *The English Language.* W. P. Ker signs a handbook of *English Literature: Medieval.* Three scientific books—Dr. John Gray McKendrick's *Principles of Physiology,* William McDougall's *Psychology: The Study of Behavior,* and Frederick Soudy's *Matter and Energy*—we hope to discuss in a later issue. This series of popularization maintains itself on a high level. (Fifty cents each.)

Pebbles

"Wait a minute! You took my king with your queen!"

"Well, that's all right. This is leap year."—*Sphinx.*

"WASN'T the fellow who jumped from the window hurt?"

"Oh, no; he struck on his head."

"On his head! But——"

"Well, he had on a soft hat."—*Dartmouth Jack-O'Lantern.*

"OH, papa," she said, with a blush, "young Mr. Chestnut, who owns so many coal mines in the Midlands, is coming again this evening, and he says he wants to see you on some important business."

"All right, my dear," responded the old man, chucking her playfully under the chin. "I know what the young man wants."

That evening Mr. Chestnut came to the point at once.

"Mr. Hendricks," he said boldly, "I want to ask you if you have laid in a stock of coal?"—*London Ideas.*

THE president of the university had dark circles under his eyes. His cheek was pallid; his lips were trembling; he wore a hunted expression.

"You look ill," said his wife. "What is wrong, dear?"

"Nothing much," he replied. "But—I—had a fearful dream last night, and I feel this morning as if I—as if I——" It was evident that his nervous system was shattered.

"What was the dream?" asked his wife.

"I—I—dreamed the trustees required that—that I should—that I should pass the freshman examination for—admission!" sighed the president.—*Youth's Companion.*

WHILE carrying a ladder thru the crowded streets of Philadelphia, the other day, a big Irishman was so unfortunate as to break a plate-glass window in a shop. Immediately dropping his ladder, the Celt broke into a run. But he had been seen by the shopkeeper, who dashed after him and caught him by the collar.

"See here!" angrily exclaimed the shopkeeper, when he had regained his breath, "you have broken my window!"

"Sure I have," assented the Celt, "and didn't you see me running home to get the money to pay for it?"—*New York Herald.*

JACOB RIIS has a story of a little lad who shines shoes for a living. This boy goes to a mission Sunday school, and was keenly disappointed when, at Christmas time, his gift from the tree turned out to be a copy of Browning's poems.

Next Sunday, however, the superintendent announced that any child not pleased with his gift could have it exchanged. Jimmie marched boldly to the front with his.

"What have you there, Jimmie?"

"Browning."

"And what do you want in exchange?"

"Blacking!"—*Harper's Weekly.*

The Independent

Entered at New York Post Office as Second Class Matter
Publisher, Clarence W. Bowen
130 Fulton Street - - - - New York

A WEEKLY MAGAZINE FOUNDED IN 1848
One Year, $3.00 Single Copies, 10 Cents

Single copies over six months old, 25 cents. Postage to any foreign country in the Universal Postal Union, $1.75 a year extra; to Canada, $1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as those offered by any responsible agency.

An order for the change of an address should be received two weeks before the change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of the publisher's price any book reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with $1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. Even so, we cannot hold ourselves responsible for their return. Authors should preserve copies of their manuscripts.

Advertising rates will be furnished on application.

The Baltimore Convention

BECAUSE the Democratic convention has not been so steam-rollered as was the Republican, it could not do its work in the allotted days, and it holds over into this week, not allowing us to comment on its candidates. On Monday morning the Clark men stood pat and were mad, and the Wilson men stood pat and were hopeful.

Chicago had its Roosevelt and Baltimore has its Bryan. Which made the most of a disturbance it would be hard to say, or which maddened most his opponents; but this is clear, that Bryan had the advantage in that he was not fighting for his own nomination; he voted steadily for Clark until Tammany's flop to Clark drove him to his other love, Governor Wilson. Bryan had the further advantage that he did not bother himself with technicalities and minor issues, such as the regularity of certain delegates, the issue on which Roosevelt withdrew his supporters, or such of them as he could, and started his new Progressive party, the viability of which is not yet assured, but which, should it live, would be his personal asset. Roosevelt was defeated in the Republican convention, and his rival and successor, whom he denounced as a traitor to the Progressive cause, was made its standard-bearer; while we may be sure, even before the Baltimore nominations or the adoption of the platform, that the Progressive element of the Democratic party will be in control, thanks in good part to the audacious statesmanship of Mr. Bryan.

We had heard much in another relation of tainted money; we now learn of tainted delegates, tainted with the money of Belmont and Ryan and the big corporation attorneys who are the associates and advisers of Charles F. Murphy. The ninety men whom Boss Murphy voted in the interest of Tammany Hall were properly called his "wax figures." That is the result of the unit rule. Senator O'Gorman and a dozen or more of his fellow delegates wanted to vote for Governor Wilson, but they could not because of that ridiculous unit rule, which binds the minority, gags and silences them, and allows Murphy to speak for his puppets.

Mr. Bryan is terribly in earnest in his asseveration that predatory interests are in control of the tainted New York delegation. In the list of names he puts first J. Pierpont Morgan, whom we have never known as a Democrat, and with him he associates the Democratic leaders, Messrs. Belmont and Ryan, the New York lawyers who sit in the seats with Tammany and Judge Parker. What the evidence is that they are not good Democrats he does not tell us. We suppose it is common report, many times repeated and loudly asserted, that he depends on; and doubtless he thinks the taint is so offensively redolent that it needs only a nose to smell it. We do not discover the evidence, beyond the fact that these men are rich and that every able lawyer has corporations for his clients. These men will all stand on the platform which Bryan will present. That they support a lowered tariff and government inspection and control of corporations is evident to all. We suppose that it is not criminal to be millionaires, to control railroads and banks and be successful business men; nor do we suppose that

riches are the perquisite solely of the Republican party. Mr. Bryan has gone to the extreme in reading New York Democracy out of the party; but that he does this with profound conviction we cannot doubt. His success in imposing his will on the convention seems to be likely to save him from the necessity of bolting the nominations, as Roosevelt has done.

William J. Bryan

As Theodore Roosevelt is the storm center of the Republican party, so is William J. Bryan the storm center of the Democratic party. Each of them has received the highest honor of his party, and each is passionately admired and passionately hated; and each is the representative of the most progressive—we might almost say revolutionary—wing of his party.

To hear his enemies speak, Mr. Bryan is the most ambitious, self-seeking and grasping of politicians, rude and reckless, careless whom he treads on if he may lift himself; he would destroy and ruin his party if he could only raise himself. He talks finely of equality of right and privilege, but it is only, they will have it, that he may play the demagog, by denouncing the possessors of wealth. It is all hypocrisy, they believe, even as Satan put on the garb of a fair stripling cherub, and deceived Uriel, the sharpest sighted of all the seven archangels. More sharpsighted than Uriel, they penetrate thru his hypocrisy, tho it be "the only evil that walks invisible except to God alone." To others he is nothing less than Abdiel, the one faithful among the faithless, or Ithuriel, the touch of whose spear exposes every false disguise, and shows selfish greed in its own native hideousness.

It is to be said of Mr. Bryan that those who belong to the other party, and who have not felt the sting of his lash, respect him much more than they did when he emerged into sudden sight, like a new star out of Nebraskan blackness, sixteen years ago. Then he appeared as the apostle of the silver heresy of fiat money, which had its term, has proved a fantasy, and has past away. Even Mr. Bryan and his party have gladly forgotten all about it, or it is remembered only to discredit the judgment of the peerless leader who made bimetalism his slogan and cry during two or three years of lecturing after his first defeat by McKinley. But most of us are ready to believe that he has mellowed much and has learned much since those passionate years. He has traveled about the world and has studied other nations as well as his own, and is a wiser man than he was when he propounded that other absurdity, for which he found no disciples, that the several States should own and run the railroads within their bounds.

Now, after three Presidential defeats, he stands before the Democratic convention at Baltimore still the most striking and influential and abused figure there. He no longer presents himself as candidate, at this time when the Democratic candidate is most likely to be elected. Of course, he has known that there is a chance that the choice might fall on him, but he has not allowed himself to seek it, and he has been perfectly true to the progressive candidates whom only he was willing to support.

We are not of those who regard him as a reckless disturber and wrecker of his party, nor as a selfish demagog. So far as the evidence appears, he has been honest in his aims for the benefit of the people, even when mistaken, and very frank in his utterance of his views, even when it required courage and endangered his own ambitions. He is a born leader. He has initiative. He does not follow the crowd, but points out the way and bids the people follow. His course at the Baltimore convention has been consistent and straightforward. He has tried to conciliate nobody, but has attacked what he regards as the dangerous policies in his party, no matter whom he might hit. This is not the first time he has done this. Before the convention opened he wrote to the prospective candidates urging them to withdraw all support from Judge Parker as temporary chairman, a daring thing to do, and in which he risked defeat, and was defeated; for only Governor Wilson dared to agree with him, and the convention refused his advice. Even more startling was his audacity in rising in the convention and demanding that the millionaire

representatives of predatory wealth from New York and Virginia, mentioned by name, be denied seats, and that no candidate be approved who represented these men. We suppose he must have known that the national convention of the Democratic party, the party of States' rights, could not override the vested right of the States to choose what delegates they might please, and he was quick to withdraw that portion of his resolution, but he forced the convention to accept the rest of it. Therein he gained the endorsement of the convention to his requirement that the party stand by the people and that it be guided by no plutocracy. We cannot see that his demand was inspired by selfish ambition. It appears to be principle with him.

Equally his next dramatic act in which he explained that he had withdrawn his vote from Speaker Clark because the latter had the support of Tammany and the financial interests behind Tammany, and that he could support no candidate that depended on Tammany for success, was absolutely consistent, and a courageous utterance. It showed once more that he was not the man, if he had any hope of being himself nominated, to avoid the opposition of perhaps half the delegates. By this act, and his previous acts, he seemed to have thrown away all his own chances. He showed himself anxious only to put the party where he stood, and he did it to his own apparent detriment. If he has his followers, he is also the most hated man in the party; and yet there are many Republicans that would be inclined to wish him success and to vote for him if they must leave their party, because they think him brave and honest. Mr. Roosevelt has used far more explosive epithets against the trusts, and has talked much more of progressive issues, but he has not defined them as has Mr. Bryan, and he has had the disadvantage of working for himself, which Mr. Bryan has studiously avoided.

It is, we think, positively to Mr. Bryan's credit that he has not categorically declared, when the question was put to him before the convention, that he would follow his party thru thick and thin, right or wrong. He would follow the party, or lead it, so long as it was true to its progressive principles; he would not go with it if it served Belmont and Ryan. That he has greatly exaggerated the evil influence of these men and their influence may very likely be true, but he has stood as no other man has for his faith, and he deserves credit for it. He is by far the strongest, boldest leader of his party, and we prefer to believe him one who is showing himself unwilling to sacrifice his principles to his ambitions.

Mr. Roosevelt's Party

At the very beginning of Mr. Roosevelt's movement for a new party, the people of the country are reading a long list of deserters. Governor Hadley, undoubtedly leader of the Roosevelt men on the floor of the convention, cannot go with him. Senator Borah remains in the old party. So does Governor Deneen. Governor Aldrich, of Nebraska, who was appointed a member of the Roosevelt committee of eighteen, declines to serve. William L. Ward, of New York, sometimes called the boss of Westchester County, will support Mr. Taft. Charles R. Crane, of Chicago, will not assist Mr. Roosevelt in organizing a new party. Nor will he vote for the ex-President. Last, but possibly not least, Ormsby McHarg, whose Southern contest work came to nothing at Chicago, joins the deserters. Judge Lindsey has incorporated a Progressive party in Colorado; Mr. McCormick has established Roosevelt headquarters in Chicago, and a few Presidential electors say they intend to vote for Mr. Roosevelt in the Electoral College. But it does not appear that the movement for a Roosevelt party gained force during the week immediately following the nomination of Mr. Taft and the announcement of a bolt. On the other hand, it lost something.

Mr. La Follette has been regarded as a Progressive. Mr. Roosevelt now has to carry the weight of his sharp denunciation. In a long statement the Wisconsin Senator remarks that the ex-President "spent weeks in carefully planning a 'spontaneous call' for himself"; that "an enormous campaign fund" was raised for him:

"Men notoriously identified with the Steel Trust and the Harvester Trust became his most active supporters. Leading reactionaries, standpatters and political bosses of the

Hanna and Quay type became his closest political friends and representatives in many States."

They carried, the Senator continues, "the great standpat States of Illinois and Pennsylvania," where "no real Progressive could have secured anything like such a vote," and this "outward seeming of success" enabled them to win in two or three States that are "really Progressive":

"Fortunately this did not enable Roosevelt to secure the nomination, which would have compromised the Progressive movement and defeated real achievement for years. Upon Theodore Roosevelt and his followers rests the responsibility of having divided the Progressives in their first national contest. Stimulated by an overmastering desire to win, they denounced loyalty to conviction and principle as stubborn selfishness. In the convention they put forward no platform, no issues. They made no fight against the reactionary platform adopted. They substituted vulgar personalities and the coarse epithets of the prize ring for the serious consideration of great economic problems, and for the time being brought ridicule and contempt upon a great cause."

It is clear that Mr. Roosevelt and his supporters will be opposed by those Progressives to whom Mr. La Follette can appeal with confidence. Their opposition will have some weight. The organization of a new party requires large expenditures and zealous devotion to great issues. Something in addition to a charge of cheating in a party convention is needed, especially when the charge is not supported by many who were in the convention as the disappointed candidate's loyal representatives.

Professors and Personality

YALE has received a great deal of unwelcome advertising in connection with Mr. Owen Johnson's story of "Stover." The discussion of social and educational problems at Harvard has taken another form than fiction. Thru the generosity of its founder, William G. Peckham, of the class of 1867, the *Harvard Advocate*, an undergraduate literary magazine, has offered substantial prizes for discussions of academic problems, and in a recent issue publishes three essays: one a courageous yet conservative account of "The Problem of Democracy at Harvard," by a member of the sophomore class, Charles H. Weston; "New Wine and Old Bottles," an argument for higher scholastic ideals, and, specifically, for honor degrees based upon graduate examinations rather than upon examinations* in courses, by a graduate of one year's standing, William C. Greene; and "A Plea for Personality in Professors," by Charles Warren, class of 1889. The last named essay is no less interesting to the outsider than to the alumnus, and is worthy of reproduction in every newspaper in the country which addresses itself to educated readers.

The vitality of a university's teaching will depend upon the vitality of its teachers, Mr. Warren asserts; and who will quarrel with him? A professor may be a fountain-head of learning, yet he is no true educator unless his stream of knowledge carries "the electric current of a powerfully live personality." Right here Mr. Warren quotes a paragraph from the late Senator Hoar's "Autobiography":

". . . There can be no comparison between the college administrators of fifty years ago and those of today. It was then the policy of the college to call into its service great men who had achieved eminent distinction in the world without. . . . There was something in the college training of that day, imperfect as were its instruments and slender as were its resources, from which more intellectual strength in the people was begotten than there is in the college training of the present generation. I will not undertake to account for it, but I think it was due in large part to the *personality* of the instructors. A youth who contemplated with a near and intimate knowledge the large manhood of Josiah Quincy; who listened to the eloquence of James Walker, or heard his expositions of the principal systems of ethics or metaphysics; or who sat at the feet of Judge Story as he poured forth the lessons of jurisprudence in a clear and inexhaustible stream, caught an inspiration which transfigured the very soul of the pupil."

Having made this quotation from a fellow graduate, the Harvard critic of Harvard proceeds to make its application unmistakable. Sympathy is the first element of personality, he affirms; but is the possession of human sympathy "the leading determining factor" in the choice of a professor by the Harvard corporation? If it is, then we see the fulfillment of James Russell's Lowell's hope:

"To make a gentleman out of every youth put under our—that is, Harvard's—charge—

*Honor degrees are already awarded at Harvard: see the article, "Harvard under Two Presidents," in THE INDEPENDENT for August 3, 1911.

not a conventional gentleman, but a man of culture, a man of intellectual resource, a man of public spirit, a man of refinement, with that good taste which is the conscience of the mind, and that conscience which is the good taste of the soul."

Harvard's millennium would, however, have dawned if all this had come true. One doubts whether the authorities base their choice of instructors on forcefulness of personality and completeness of sympathy, but, as Mr. Warren points out, five of the great Harvard professors in recent years, men of most varied tempers and talents, all excelled in this attribute of sympathy. Nathaniel Southgate Shaler was more than a stirring lecturer; he had a genius for friendship. Francis J. Child revealed in his relations with men "a certain quality of tender and genial humanity." The secret of Charles Eliot Norton, who wrote these words of Professor Child, lay, according to Prof. Bliss Perry, in "the breadth of his personal and intellectual sympathies, and his known constancy to all the offices and loyalties of friendship." Something of the sort has been said, too, of Louis Agassiz, different as were his progressional interests, and of James Mills Pierce. There is monotony in the recurrence of the words "friendship," "loyalty," "sympathy," in the tributes paid to Harvard's greatest teachers by their pupils and associates: yet those words are grand words, no more sonorous than vital.

There are today, at Harvard, both professors and instructors—yes, and underpaid "assistants," too—who are rich in these gifts of comradeship; who naturally draw their students to them *as men,* and who develop in those students the faculties in which they themselves excel There are instructors who give of their time and strength to students with whom they have come into contact—no easy thing in these days of faculties overladen with committee meetings and swollen lecture courses. And these are the men —tho they are in a minority—who really educate anywhere. Too much emphasis has been laid, of late, on endowment, enrollment and equipment. These materials in university building are just as likely to be exaggerated by the college governors beyond their real importance as are athletics and student clubs among the "students" themselves. Personality remains the essential in college and out of it, character being inseparable from personality, a fact which is at the bottom of Mr. Owen Johnson's attack upon the Yale social system no less than it is the kernel of Mr. Warren's discussion of Harvard teaching. And whether or not one accepts the suggestion that the "leaders" in the teaching force of the university be reinforced by the engagement, for short periods of service, of successful authors, scientists, artists and specialists and scholars of various kinds, there is no denying the general truth of his assertion that the Harvard Corporation (or, for that matter, the governing body of every university)—

"can do no greater service to the nation at large than by insisting on the attributes of human sympathy and vigorous personality in its professors, even tho to obtain them it may be obliged to accept a less degree of superior technical proficiency."

A Country Life Conference

THE State of Wisconsin has been said to be simply an expansion of the University of Wisconsin. At any rate the University of Wisconsin has succeeded in getting hold of the people of that State marvelously. It is doing a lot of thinking for the people, especially thru its agricultural department. Not long ago the people were called together for a sort of round table conference at Madison. It was proposed to investigate and discuss the functions of a church and the business man and the country school and the country press and the country library, as bearing upon country life, and making it what it ought to be. Ministers and physicians and lawyers and merchants as well as professors coöperated. It is startling to find how much public sentiment has changed. All classes are becoming deeply interested in country life.

Dean Russell probably stated the problem correctly, when he told the conference that the agricultural college was no longer "material" in its spirit and purpose; that its highest ideal was by no means to make two blades of grass grow where one grew before; or to make more corn in order to feed more hogs, and buy more land by selling the pork. Agricul

ture has become spiritualized, so that as Dean Bailey expresses it the land itself is a church, and every home a school, our high schools in the country organizing on the same principle, that they are most intimately associated with the family, and in no sense have any other aim in view than to ennoble the family and develop it.

Agricultural education should train for "a type" of living; a distinct and better type than has been in vogue. As Dean Russell says, country living should mean "the expression of the fullest possible life in the open country." That is, the country should acquire, and it is steadily acquiring, those advantages which naturally have sprung up in town life, and with them it should retain all the advantages of homing with the bees and the birds and the brooks. There is no occasion for urging a movement back to the land, when that movement runs the settler into swamps or deserts—either physical or intellectual. Only when the country supplies the wants and needs of man, social and intellectual, only then should the call of the farm exert any controlling influence over our young people. It is quite true that the country must work out its own salvation, not by booming strawberries and cream only, but by booming social and religious advantages of a superior sort.

We are rather inclined to think that this Wisconsin conference marks the dawn of a new sort of country life. We do not mean that nothing of the kind has gone on before. Such men as Professor Henry and Professor Bailey have talked on this line for many years, somewhat as prophets, but their prophecies have all the time been coming true. The conference did not go beyond literal data when it included bankers and ministers and teachers and country editors as closely affiliated with the farmer, and united in working out a new spiritual life in country homes. Rural sociology and economics are subjects which furnish a point of contact between the minister and the parishioner, not only more practical but vastly more likely to be influential than the history of the Jews. One of the speakers defined the business of a country minister to be "to create a better brand of Christians," one who stands the test of social, industrial, commercial and political life. To this end he agrees that scientific agriculture, embracing all the specialized phases of the subject, making the earth to yield her increase more liberally and the rural community become more prosperous, is a religious problem. He insisted that clean citizenship in local politics, good roads, recreations for children and old people, better community life, sanitation for the home and the neighborhood, really come into the modern creed.

It was a banker who told the conference that country affairs are going thru a revolution; that the high schools are now scientific schools, and our homes are becoming schools of domestic science. Well, we knew this before, but it is a good thing that the business men of our towns are beginning to apprehend that the general welfare is wrapped up in scientific work. The colleges must prepare for this turn in affairs, and they have got to prepare teachers able to comprehend the change, and to work along the new lines.

The Wisconsin conference was a wisely conducted affair in bringing all classes of workers together. Farming is not an industry by itself. It has absorbed recently nearly every known science into its daily curriculum of work. It is now entangling every other occupation in its success. Editors and bankers touch closely the life of the farming community, and they must be called in to confer with the farmer, and to comprehend his needs. The spirit of agriculture must be understood by all classes, as the contempt for "Old Hayseed" has passed away. Dean Russell, who led the conference, said that the country minister, if he could discuss the relative merits of seed corn, of feeding and managing dairy herds, of selecting apples and teaching how to grow them successfully, would be in a position to exercise a more potent influence over the moral and spiritual needs of his parish. He would place agricultural college training ahead of Sanskrit and Greek in the training of the country minister. But no one during the conference failed to unite the physical with the intellectual and moral. This is the new spirit of the age, the unity of body and soul, the fellowship in

training the muscles and the mind. The farmer is no more of a lubber, a mere toiler with tools, than is any other class of the community.

Three Vetoes

Our American theory of legislation is founded on the bicameral system, which has come to us from Great Britain, where it has its House of Lords and House of Commons. The purpose of a bicameral system is to put a restraint upon radicalism by balancing it with conservatism. In our lower and more popular house the entire membership is chosen every two years, and it responds quickly to the wise or unwise judgment or passion of the people; while the members of the Senate hold their seats for six years and only a third of them go out of office at the time when all the Representatives return to the people who gave them brief authority. The Senate is the balance wheel which keeps the legislative machine from racing to destruction. And, as if that were not enough, our Constitution adds to the veto of the Senate the veto of the President to curb the hasty popular will. Must we consider this double veto, that of the Senate and that of the President, as a hindrance to progress, or is it a brake that is put on in time of danger from popular passion?

In Great Britain they have gone farther than we in removing the brake and in trusting the people. First, they abolished the royal veto, which corresponds to the President's veto with us. The King of England can veto nothing. He does not even dare to express an opinion on any proposed legislation, much less would he ever think of appealing to the people or even of advising any legislation, as it is the duty of our President to do. Our President can use the "big stick," but the British monarch is a King Log, on whom every frog can jump. We have assigned an enormous power to our President, whether in helping or hindering legislation. We call his department the executive, and so it is; but it is also a co-ordinate legislative branch of the Government.

Now again, in this past year, Great Britain has taken away the veto power also from her House of Lords. This is an immense constitutional change. The only vestige of this veto power in the House of Lords is that they are allowed to delay legislation for a year or so. Two bills are now before Parliament, having past their second reading, to which probably the King, and certainly the House of Lords, are bitterly opposed. One is Home Rule for Ireland and the other is the relief of Wales from the Established Church. Both bills will this fall pass the House of Commons and will be rejected by the House of Lords, but will be re-enacted by the House of Commons, be automatically signed by the King, and become laws before the end of next year. We should in this country call such a procedure the most extreme if not intolerable radicalism. Great Britain is democratic; we are conservative. Great Britain is all the time taking steps in legislation that would make us gasp. What is the reason? Is it because here two vetoes stand in the way?

But there is with us yet another veto, a third brake that halts the legislative machine; it is the Supreme Court. A law may pass the House, then squeeze thru the Senate, and even escape the President's veto, and then be annulled by the Supreme Court. This has often been done. Perhaps four members of the Supreme Court support a law and five members declare it unconstitutional; then the fifth has the power to thwart the will of the people as exprest by the votes of over four hundred Representatives, ninety-four Senators and the President of the United States. So careful were the framers of our Constitution that no sudden gust of popular feeling shall change the established order. Where Great Britain allows no veto we allow three.

Are we then in a worse case than are our British brethren? Many would think so. It is very likely that were we to call a fresh constitutional convention we should considerably liberalize our present Constitution. And yet there is no great call for a change. We are getting along fairly well. We are very much better off than Great Britain was before she ended the veto of the House of Lords. The composition of the House of Lords made it permanently and surely conservative. There was no hope for a

progressive measure. We have such hope. The Senate is not a permanent body, like the House of Lords. It is responsive to the people, if not as responsive as the House of Representatives. Four years ends the term of two-thirds of the members, and six years makes an entirely new deal. The President may veto a law, but the people can replace him every four years. The Supreme Court may reject a law as unconstitutional, but its membership is constantly changing, new members being nominated by the President and confirmed by the Senate. And if all these methods of relief fail, and the desired law is found unconstitutional, the Constitution itself can be changed. We hear it said that it is not easy to amend the Constitution. It does take time, but it is not impossible. It is not so very long a time since the Supreme Court declared the national income tax law unconstitutional; but Congress sent an amendment down to the States for approval, and this next winter the Sixteenth Amendment will be added to the Constitution. It now lacks the votes of only three States, and these will easily be found in Pennsylvania, West Virginia, Florida, Louisiana, Wyoming and Utah, which have not yet ratified or rejected the amendment. What Great Britain can do in progressive legislation in two years it may take us six years to do. Perhaps it is just as well that we should take six years about it. Neither the Senate nor the Supreme Court is yet to be classed as obsolescent.

Harmony

When Mr. Bryan telegraphed to each of the aspirants for the Democratic nomination asking them to unite with him in opposing the selection of Judge Alton B. Parker as temporary chairman of the Baltimore Convention, on the ground that he represents the anti-progressive wing of the party, Governor Foss, of Massachusetts; Governor Marshall, of Indiana, and Governor Baldwin, of Connecticut, all declined to join Mr. Bryan; only Governor Wilson, of New Jersey, stood with him. Speaker Champ Clark said, "The supreme consideration should be to avoid any discord in the convention," and that "all should join in the interest of harmony." Harmony is a good thing, and when all think right, or all think wrong, there can be harmony. But where vital interests are involved harmony is usually the plea of the worser side. It means the giving up of principle for policy, for it is the advocates of a high principle who are asked to yield or to keep silent for the sake of harmony. The real issues at the Baltimore convention would have been obscured if Mr. Bryan had not three times, in spite of harmony, pressed the issue to a division, and so forced the convention to assert its progressive faith against the solid ninety votes of Tammany. Speaker Clark's plea for "harmony" and success as the chief consideration gained him no help, except in a few useless votes from New York.

D. W. Bartlett

We record the death, at the age of eighty-four, of David W. Bartlett. For over twenty years, including the period of the Civil War, the initials "D. W. B." were signed to the weekly letters of THE INDEPENDENT'S Washington correspondence. They were read with the greatest interest, and we have old subscribers who can attest their value. Mr. Bartlett was in warm sympathy with the position of THE INDEPENDENT, for he was one of the editors of *The National Era,* at the time when "Uncle Tom's Cabin" saw the light. When the war broke out he was commissioned to carry despatches to General Wool, in New York, but the railroad tracks had been torn up for miles by Southerners, and Maryland secessionists patrolled the roads, so that he had to travel by unfrequented routes, driving by night across mountains to reach a point where a train could be taken with safety. At the age of nineteen he had joined the editorial staff of the Hartford *Republican,* and soon went to Washington and was correspondent also for the New York *Evening Post* and the Springfield *Republican.* He withdrew from this service to become secretary of the Chinese Legation. It was after this that Mary Clemmer Ames became our Washington correspondent. Mr. Bartlett was the author of the first "Life of Abraham Lincoln" and of books of travel abroad, and his "Life of Lady Jane Grey" still

has a considerable sale. He died June 14, at his residence in West Haven, Conn. He was a man of fine character and an able journalist, who had the respect of all who knew him.

French Congress in Quebec

Our papers have been so submerged with the reports of the conventions that they have not had the space to mention an important congress in Quebec for the preservation of the use of the French language and the religion associated with it, in Canada. This past week Quebec has overflowed with racial and ecclesiastical enthusiasm. Three archbishops, a dozen or so bishops, and every order of monk that ever wore a tonsure were in the streets and the assemblies. The congress opened on the Feast of St. Jean Baptiste, and with the first comers was Mgr. Mathieu, Bishop of Regina, with 500 pilgrims from the Northwest, followed by a multitude of other pilgrims and worshipers who attended the opening mass at St. Sauveur Church and witnessed the dedication of a statue in honor of its first curé. We have received the medal of the congress, with its motto, in French, which says, "It is Our Dear Speech which Keeps us Brothers"; and the children on the street wore sashes tied over the shoulder bearing the inscription, *"Parlons la Langue Française pour Parler à Dieu."* The maintenance of an ancestral language in another environment is the best way to maintain also the ancient traditions and manners and to escape the pressure of new ideas and institutions. The leaders of French Canada understand this, and know it the best way to preserve their old influence. But the tens of thousands who are migrating to the United States and going back again are carrying with them a new influence as well as learning the prevalent English language.

Jokes, Latin and Greek

Latin puns and jokes are not very familiar in these days in which Latin is fast following Greek, and we are obliged to Professor Gildersleeve, in the last issue of *The American Journal of Philology*, for recovering a story of Frischlin, a German teacher of the sixteenth century, who once proposed for discussion the thesis that "The *world* is one"—*"Mundus dumtaxat unus est."* A stupid Savoyard based his contradiction on Luke 16:17, *"Nonne decem mundi facti sunt,"* as if translated "Were there not ten worlds made?" Instead of correcting the error Frischlin kept his countenance and answered gravely: "But do not the words read, 'Where are the nine?'" When Prof. James H. Hadley was a tutor in Yale College—so we have heard in the elder days—a certain student's inferior scholarship brought his case before the faculty for removal; but Professor Goodrich pleaded for him because he had heard him offer such fervent petitions in prayer meetings. He was allowed further grace, but Tutor Hadley begged that he be told that his position was a *precareous* one. A better college witticism of the sort was that perpetrated by the son of Rufus Choate at Amherst College, but this was in a Greek recitation. Professor Tyler had Choate read the first lines in Plato's "Gorgias," in which Socrates, having entered just as Gorgias had finished his lecture, remarks, "So I have, as they say, come after the feast and am too late." "Yes," replies one of the auditors, "and an excellent" (*asteias*) "feast it was." "What," asked Professor Tyler, "is the force of the word *asteias?*" "It comes," said young Choate, "from *astu* (Greek word for *city*), "and indicates the character of the feast." This bright young student was killed in the Civil War. But to return to Scripture, that was a shrewd Franciscan monk who preached a vigorous sermon against the new astronomy from the text *"O viri Galilæi, quare statis in cœlum aspicientes?"* which he rendered, "O men of Galileo, why stand ye gazing up into the heavens?" Doubtless our readers could remind us of a hundred other classical witticisms equal to these; but we will add only the complaint of a preacher in the same old days because the canons of the Church were giving way for the cannons of battle, the mitre for nitre, and Saint Peter for saltpeter.

A county high school in Wisconsin gathered five thousand people to attend its graduating exercises, held in a huge tent. It is so that the people used to

flock to college commencements over half a century ago. Now, here in the East, the people do not go to a commencement, but the alumni do. It is they, with their class rivalries for big attendance, that swarm the campus. The elder way was better, for it indicated the affection of the people for the schools that had taught their boys, and the fellowship of town and gown—only that in those days the graduate did not separate himself from his fellows by cap and gown. A decidedly regrettable late feature of these commencements is the appearance of the younger classes in the most ridiculous garb they can invent, as if a college were not a serious institution, but a clown's circus. Of course, it is the most rattle-brained of the classes that concoct and impose these monstrosities, and sometimes set up a bar in their headquarters. Even graduates of a year's standing, too young to vote for alumni trustee, ought to have learned some sobriety since leaving college, if they learned none in classic halls.

Some of the Southern State universities are learning that the things nearest to them is what they most need to study, and they are turning their attention to the social and industrial condition of the negroes at their hand. The effect must be good. Now Professor Dillard, in executive charge of the Jeans Fund and the Slater Fund for the education of negroes, has called a commission of professors from eleven Southern universities to make a study of the adjustment of relations between the white and colored people. Influence for better relations ought to come from such a body of men. Possibly a similar commission from eleven of the leading colleges for colored men in the South could give aid by a similar investigation, which would supplement the studies of the sociological department of Atlanta University.

On June 23, Edward Albert, Prince of Wales, was eighteen years old. That means that he is old enough to assume the full royal rights were his father to die. But he is not of age, nor will he be of age until, like any other boy, he is twenty-one—and when twenty-one it will not be lawful for him to marry without paternal consent. To be his own master in marriage he must be twenty-five. Thus at eighteen he can rule as King of Great Britain and Ireland and Emperor of India, but cannot choose a wife. Indeed, it is thought, under British law, that it requires less experience and training to rule the British Empire than it does to rule a wife.

What the lawyers think of the judges ought to be of value. The Pennsylvania Bar Association met last week, and its members voted down almost unanimously a recommendation from its judicial committee that the State give up the system of electing judges and make them appointive. It was the general view that the people had elected good judges; and one speaker who defended the elective system said that he had been defeated by an excellent jurist who would never have been appointed because a Democrat.

The separation of Church and State in France is putting life into the Churches. Since that date, nine new Catholic parishes have been established in Paris and fifteen in its immediate neighborhood, and twenty-four chapels have been built, providing forty-eight new religious centers. And yet the law of separation is bemoaned, so slow are some people to recognize their mercies.

We observe among the names of the four new peers in the annual birthday honors that of Sir Francis A. Channing, which will interest American readers. Lord Channing is the son of the famous American Unitarian clergyman, the Rev W. H. Channing. He is a man of great public spirit, and much devoted to the development of agriculture and reforms.

The constitutional convention now sitting in Concord, N. H., has rejected woman suffrage by a vote of 208 to 149. That is decidedly hopeful for New Hampshire, nearly three to four in favor of the women. It will come before very long.

Insurance

Darwin P. Kingsley

THE New York Life Insurance Company has just issued an interesting little pamphlet, entitled "The First Five Years of President Kingsley's Administration." It furnishes the peg on which to hang the following remarks:

On June 17, 1907, Darwin P. Kingsley, then vice-president of the New York Life Insurance Company, was elected president of that institution following a service in various capacities which began in 1889. He became the chief executive officer in the largest life insurance company in the world at a time when, as the result of a government examination into the whole life insurance organization, the old order under which it had been established and had grown to gigantic proportions was, by legislative enactment, swept out of existence, and a new one, strange in many particulars, erected on the remains. The old policy contracts were interdicted for the future, and others, formulated and prescribed by the State, ordered in their place; unrestricted freedom in securing new business was abolished, and companies of the class of the New York Life were forbidden to accept an aggregate of new insurance in excess of $150,000,000 a year; old expense systems were suspended for one devised by the State. The changes were radical—in many respects fundamental—and for a comparatively brief period the companies, unable to respond to them readily, lapsed into a state of coma.

It was this set of conditions which confronted President Kingsley when he assumed the responsibilities of guiding the destinies of the company. He knew from long experience that the situation bristled with difficulties; he realized to the full the unwisdom of much that the new laws required; he possessed an effective and superb agency plant with a capacity two or three times too large and powerful for the work the State permitted the company to do; there were thousands of old and faithful agents all over the civilized world facing the loss of their positions and incomes. But he resolutely applied himself to the task he had accepted, and day by day, with patient persistence sought to successfully readjust the company to its new environment.

Willingly obedient to the laws which he knew were in some ways injurious to the best interests of the companies, he lost no opportunity of voice or pen to make the legislative mistakes plain to the people and to plead for their correction. Upon accepting the presidency he said:

"The law must be observed in spirit as well as in letter, and that keen sense of justice and love of fair play, which in the end always marks the judgments of the American people, may be trusted to remedy excesses and correct evils in the laws themselves, just as it can be trusted to remedy excesses and correct evils by process of law."

In an address to the Association of Life Insurance Presidents, December, 1907, he said:

"Time has pointed out some of the errors made by the Legislative Committee and some of the errors made by the Legislature. They are such errors as have always been made by honest men asking reform. They are errors, however, which to a considerable degree can be remedied, and a remedy is demanded by the imperial position of this State, by the interests of the citizens of this State, by the existing obligations of the citizens of the State to the citizenship of the world."

In 1908 the law was amended permitting a greater degree of freedom in expenditures for new business. It is impossible in this place to hint at the great public labors performed by Mr. Kingsley in this matter while discharging the exacting duties as chief executive of the company.

His first five years as president are marked by substantial achievement: The company's total income has risen from $100,890,180 to $112,669,667; its assets from $474,567,673 to $684,684,686, and its total insurance in force has increased $72,500,000. Mr. Kingsley has proven himself the equal—and in some respects the superior—of the very able men who have occupied the presidential chair of the New York Life Insurance Company.

Financial

Securities and Trade

THE market for securities on the New York Stock Exchange continued, last week, to be a narrow one, owing to political events, but it was not depressed. Transactions amounted to only 1,487,896 shares, against 1,265,738 in the week preceding. There was dulness, but also a firm undertone, and prices at the end showed a slight net gain. Changes affecting the three stocks which furnished 41 per cent. of the business were as follows: Steel, +1; Union Pacific, +½; Reading, —½. General trade reports were encouraging. Optimism was suggested by the condition of the steel industry. Mills were working almost to the limit of their capacity, and still were unable to meet promptly the demand for consumption. All the manufacturers added $1 per ton to the price of bars, structural shapes and plates. Many are surprised because recent political events have not, so far as can be learned, affected general trade or the securities market. Probably these events have restricted speculation in stocks, but they have not depressed prices. On the contrary, prices have been rising slowly.

A Ship Company's Report

OWING to the loss of the "Titanic," the annual report, published last week, of the International Mercantile Marine Company attracted more attention than has usually been given to this company's financial statements. The report, however, relates only to the calendar year 1911. It is well known that the company's stock issues and bonds do not have a high rating in the market. The common stock ($49,921,800), par $100, is quoted at $4.50; sales of the cumulative 6 per cent. preferred ($51,731,000) were made last week at $18; and the 4½ per cent. bonds ($71,000,000) were selling at 65⅜. No dividend has been paid on the preferred since 1902, and the accumulated liability exceeds $37,000,000. At the end of last year, however, there was evidence of improvement. A deficit, in 1909, of $1,297,000 in the profit and loss surplus had been displaced by $821,962 on the right side, altho annual allowances for depreciation had been considerably below the average observed by conservative ship companies. Last year's allowance was $3,736,793, for a fleet of 120 ships, valued at nearly $190,000,000. At the end of the year, the insurance fund was a little more than $2,000,000. But the company's share of the "Titanic" loss is estimated to be more than $3,000,000. Among the many who have reason to deplore the loss of that ship, and to regret the recklessness which invited a disaster, are the holders of the company's stock and bonds.

....Toronto capitalists are forming a combination of Canada's flour mills, and it is expected that sixty mills will enter it.

....James J. Hill resigned the chairmanship of the Great Northern Railroad's board on the 1st, withdrawing from active participation in the company's business, and thus completing thirty-three years of railway service in the Northwest.

....A merger of two Brazilian companies controlled in Canada and London —the Sao Paulo Tramway and Light Company and the Rio Janeiro Tramway, Light and Power Company—has been incorporated at Ottawa, with a capital stock of $120,000,000. Sir William Mackenzie, of Toronto, is chairman, and F. S. Pearson, of London, president.

....A recent census report shows that 387,771 persons were engaged, in 1909, in the manufacture of cotton goods in this country. The capital invested was $822,237,592, and $628,391,813 was the value of the product in that year. In number of employees and in value of product Massachusetts was first (its share of the entire industry being about 30 per cent.), North Carolina second, South Carolina third, and Rhode Island fourth.

The Independent

VOL. LXXIII NEW YORK, THURSDAY, JULY 11, 1912. No. 3319

Survey of the World

Wilson and Marshall Nominated

The Democratic National Convention, at Baltimore, on the 2d inst., nominated Governor Woodrow Wilson, of New Jersey, for President, and Governor Thomas R. Marshall, of Indiana, for Vice-President. When the delegates assembled, on Monday, the 1st, there was no indication that the deadlock would soon be broken. The first ballot that day was the twenty-seventh. On the thirtieth Wilson passed Clark, having 460 to the Speaker's 455. Thereafter the Governor gained steadily but slowly, and the Speaker fell behind. After the thirty-fourth ballot a recess was taken. In the evening, on the thirty-ninth ballot, Wilson for the first time had 500. After the forty-second the convention adjourned until Tuesday. Wilson had fallen a little below 500. The next morning Speaker Clark came hurriedly to Baltimore from Washington, hoping to gain some votes, but he learned that the Illinois delegation had decided to shift the State's vote to Wilson. It was on Monday that John B. Stanchfield, a New York delegate, made a bitter speech, attacking Mr. Bryan for what he had said Saturday night about the influence of New York. He denounced Mr. Bryan as "a selfish, money-grabbing, favor-seeking, office-chasing, publicity-hunting marplot." On Tuesday's first ballot the 58 votes of Illinois were turned from Clark to Wilson, and the latter made other gains, his number rising to 602. On the forty-fifth ballot he had 633 and Clark only 306. Senator Bankhead then withdrew Underwood's name. In reply to a suggestion that the latter should have second place on the ticket he said that Underwood ought not be drawn away from his important work in the House. Senator Stone then released the Clark delegates; Mayor Fitzgerald, of Boston, withdrew the name of Governor Foss, and Representative Fitzgerald, of New York, moved that Wilson be nominated by acclamation. But the roll was called again, and on the forty-sixth ballot Wilson had 990; Clark, 84, and Harmon, 12. Then, on Senator Stone's motion, the nomination of Governor Wilson was made unanimous. In the evening the platform, which had been prepared by Mr. Bryan and approved by the Governor, was adopted, and the ticket completed. When a delegate from Georgia nominated Speaker Clark, ex-Governor Dockery, of Missouri, interposed with a declination, saying the Speaker preferred to remain in the House. A delegate from the District of Columbia nominated Mr. Bryan. The latter declined and then seconded the nomination of Governor Burke, of North Dakota. On the first ballot there were 389 for Marshall, 305 for Burke and 157 for Senator Chamberlain. Votes were cast for several other candidates. On the second ballot Marshall had 645½ and Burke 387. Then Burke was withdrawn and the nomination of Marshall was made unanimous. The convention adjourned at a few minutes before 2 o'clock in the morning. When he declined to be a candidate for second place, Mr. Bryan spoke at length. For sixteen years, he said, he had been a fighting man. He had not hesitated to speak out on any public question, or to excite the hostility and the enmity of men when he felt it to be his duty to do so in behalf of his country. A man who fights must carry scars, and long before the beginning of this canvass he had de-

cided that he had been in so many battles and had alienated so many men that his party ought to have the leadership of some one who had not so offended and who might lead with greater hope of victory. He came with joy to surrender into the hands of the one chosen by the convention a standard which he had carried in three campaigns and which had never been lowered in the face of the enemy. The reasons which led him to prefer another for the Presidency governed his course with respect to the second place:

"It is not because the Vice-Presidency is lower in importance than the Presidency that I decline. There is no office in this nation so low that I would not take it if I could serve my country by accepting it. I believe that I can render more service to my country when I have not the embarrassment of a nomination and have not the suspicion of a selfish interest, more service than I could give as a candidate, and your candidates will not be more active in this campaign than I shall be. My services are at the command of the party, and I feel a relief now that the burden of leadership is transferred to other shoulders. All that I ask is that, having given us a platform the most progressive that any party of any size has ever adopted in this nation, and having given us a candidate who, I believe, will appeal not only to the Democratic vote, but to some three or four millions of Republicans who have been alienated by the policies of their party, there is but one thing left, and that is to give us a Vice-President with our President who is also progressive, so that there will be no joint debate between our candidates."

Owing to Mr. Bryan's speech on Saturday, Speaker Clark that night declared that his "implied accusation were both

THE NEW YORKERS AT BALTIMORE

From left to right are standing Lewis Nixon, the shipbuilder; Norman E. Mack, of Buffalo, Democratic national chairman; Charles F. Murphy, leader of Tammany Hall, and Congressman Fitzgerald, of Brooklyn, who made the motion to dispense with the roll-call and to nominate Woodrow Wilson by acclamation.

false and infamous." On the 2d, in a published statement, he said:

"I lost the nomination solely thru the vile and malicious slanders of Col. William Jennings Bryan, of Nebraska. True, these slanders were by innuendo and insinuation, but they were no less deadly for that reason."

He has urged his friends to give the ticket loyal and enthusiastic support. Thomas F. Ryan says it is the duty of all Democrats to accept the convention's decision with good will and no regrets, and to work for the election of Wilson. Mr. Underwood has asked the Governor to advise with him as to "any matters transpiring at Washington." The party leaders have visited the Governor at Sea Girt, N. J., and bowed to his will. Formal notice of his nomination will be given to him there on August 7.

Mr. Roosevelt's Party

The call for a convention to form the proposed new party was issued on the 8th, and the convention is to be held in Chicago on August 5. Forty States are represented by the signers, and the call is addressed to "the people of the United States, without regard to past political differences." Among those whose names are attached are James R. Garfield, of Ohio; William Flinn and Gifford Pinchot, of Pennsylvania; Cecil Lyon, of Texas; Senator Poindexter, of Washington; Governor Carey, of Wyoming; Judge Lindsey, of Colorado; Medill McCormick, of Illinois; Henry J. Allen, of Kansas; Charles J. Bonaparte, of Maryland; Matthew Hale, of Massachusetts; Senator Dixon, of Montana; Everett Colby, George L. Record, and ex-Governor Fort, of New Jersey; Governor Johnson, of California; Leslie Coombs, of Kentucky; Governor Vessey, of South Dakota; William A. Prendergast, Oscar S. Straus, and Timothy L. Woodruff, of New York. The call appeals to those who "realize that the power of the crooked political bosses and of the privileged classes behind them is so strong in the two old party organizations that no helpful movement in the real interest of the country can come out of either"; who believe in the right and capacity of the people to rule themselves; who believe that government by the few has become government by the sordid influences that control the few; that only thru the proposed movement can legislation demanded by modern industrial evolution be obtained; and that the commandment (Thou shalt not steal) applies to politics as well as to business.——After the nomination of Wilson there was a noticeable tendency among the Roosevelt Progressives to avoid the movement for a new party. Governor Osborn, of Michigan, opposing such a movement, said Republicans could vote for Wilson without bolting. In Colorado the Progressives in conference voted against a new party. Two or three Progressive Republican newspapers began to support Wilson. In several States the Progressive organization was divided. Mr. Bonaparte said the Wilson nomination made Roosevelt's success less probable and his candidacy "less obviously needful in the public interest." But Mr. Roosevelt said he would not turn back. Complete tickets were to be put up in all States where the organization was not controlled by Progressives. He intended, he said in interviews, to inquire concerning the causes of the high cost of living, with especial reference to meat, butter, milk and eggs. The platforms of both the old parties were wrong in demanding rigid enforcement of the Anti-Trust law; Trusts should be controlled and regulated by the Government. In the Senate, Mr. Works, of California, offering a resolution for a searching inquiry as to the expenditure of money for Presidential primaries, said he could not join a new party movement, nor could he support Mr. Taft, who secured his nomination by unjust and illegal means. The Taft and Roosevelt campaign had been undignified and disgraceful. The movement for a new party was "founded upon hatred, revenge and ambition." Senator La Follette again asks Mr. Roosevelt to publish the expense account of his canvass. He was supported, the Senator says, by the Steel Trust and the Harvester Trust, and his canvass was "characterized by riotous expenditure." The publicity demanded, the Senator adds, would defend the people against the political investments of special privilege.

Secretary MacVeagh Attacked

The resignation of A Piatt Andrew, an Assistant Secretary of the Treasury, was made known on the 3d. It had been placed in the hands of the President. At the same time Mr. Andrew sent to the President a long letter, and to Secretary MacVeagh another, giving copies of them to the press. Writing to the President he sharply criticised the Secretary, saying he himself and other prominent officers of the department (whom he named) had been "hampered and discouraged" by Mr. MacVeagh's "idiosyncrasies, his astonishing capacity for procrastination, his incapacity for decision, and the peculiar moods of suspicion and aversion to which he is continually subject." Among those named were Comptroller Murray, Treasurer McClung and Commissioner Cabell. Several officers, he said, had been upon the point of resigning because of the Secretary's curious conduct. All the interviews of the Secretary with Andrew himself during the last year would not amount to one hour. The Secretary would unaccountably delay decisions for several months, and for months at a time had not been on speaking terms with certain responsible officers. The resignation was tendered "with infinite regret," but under such conditions it had become impossible to do the business of the writer's office. After the publication of the letters Mr. Taft said:

"Mr. Andrew's resignation as Assistant Secretary of the Treasury was requested, submitted and accepted in view of his failure to obey orders given to him by the Secretary."

On the 4th, Mr. MacVeagh said that the resignation had not been a voluntary one; that Andrew had repeatedly been asked to resign and had repeatedly begged to be allowed to remain in office; that he had gone to the Chicago convention in disobedience of orders given three times; that after his return letters asking him to resign had been sent to him four times; that finally Mr. Taft in writing authorized and directed him (the Secretary) to ask for the resignation, and that the publication of Andrew's letters followed. Andrew, he added, had not been efficient enough, and it had been necessary to get some one in his place. Whereupon Senator Lodge said the charge of inefficiency was an absurd one. He had known of Andrew as a professor at Harvard and as Director of the Mint, and was convinced that his services had been of much value to the Government. It is said that Senators Root and Crane went to the President in Andrew's interest. Mr. Taft said on the 5th that the incident was closed. Mr. MacVeagh's statement warranted an inference that the officers named by Andrew were standing with the Secretary in the controversy. There were some indications, however, that there had been foundation for Andrew's assertions about them, and his friends said these officers had approved his letter before the publication of it.

Plague in Havana and San Juan

Bubonic plague has appeared in Cuba and Porto Rico. It is said to have been brought from Trinidad to San Juan (Porto Rico), where twenty-one persons have died of the disease. Many residents have left the city. Thousands of rats have been killed, the Government paying a bounty of five cents for each one. There was no case in Cuba until the 3d inst., when a Spaniard employed as a hostler in connection with sewer contracts in Havana was taken to a hospital in that city. Three days later a board of physicians reported that he had the plague. He had been taken ill at his lodgings, which were very near the Government palace. It is now said that three other persons in Havana have died of the disease. President Gomez has left the city for his house in the country.——After the death of General Estenoz, the negro rebels showed no signs of activity until the 5th, when they attacked a police station on the outskirts of Santiago and killed a policeman. Many refugees who went to Santiago have now returned to their farms and plantations, and several of the American battleships have sailed for their home stations.——In Honolulu, on the 4th, the veterans of the Grand Army of the Republic refused to take part in the anniversary ceremonies because Miss Hyo Myahara, a Japanese girl, had been appointed to read the Declaration of Independence on the steps of the capitol. More than half of those in the parade were Japanese or Chinese.

Orozco Defeated in Mexico

A decisive battle was fought on the 3d at Bachimba Pass, 40 miles south of the city of Chihuahua. It began in the morning, and at night General Huerta reported to Madero that he had won a great victory, having taken all of the important positions originally chosen and held by Orozco, the rebel commander. Huerta's artillery had been effectively used and Orozco was short of ammunition. Before the next morning Orozco retreated, and when Huerta, at daybreak, prepared to resume the fight, he found before him only Orozco's dead and wounded. It was reported, the day before the battle, that hundreds of the Federal soldiers, in railway cars, had been killed by the explosion of one of Orozco's mines, but it now appears that a water tank was destroyed and that no soldier was killed. Huerta found and dug out eight of Orozco's mines. Orozco retreated toward Juarez, burning the railway bridges between that city and Chihuahua. Huerta's army entered Chihuahua on the 5th. On the following day about 2,000 of Orozco's men arrived at Juarez. There was a report that Orozco had threatened to shell and destroy the El Paso gas and electric light works (which supply light for Juarez) and thus to compel intervention. But he denied that he had made such a threat or that it was his purpose to injure American property. Partly on account of the report, the Governor of Texas ordered militia, a battery included, to El Paso, although 3,000 soldiers of the Federal army were there. Orozco decided to send his troops westward, into Sonora, and to carry on guerrilla warfare. His purpose, as set forth by his father, was eventually to get possession of a Pacific port, Guaymas preferred, and there to seek a supply of ammunition from abroad. Persons representing him said that at Guaymas he could obtain ammunition from Japanese or German firms. But in moving westward his soldiers will encounter a large Federal force, whose aim it is to check and capture them. At the end of last week it was thought that there would be no fighting at Juarez.——Dispatches from the Mexican capital say that Jose Limantour, for many years Minister of Finance, has been formally accused, as the result of an inquiry made by the Permanent Committee of Congress, of robbing the treasury at the time of the downfall of Diaz, and the sum named is $10,000,000.——Great floods, last week, in Jalisco, Guanajuato, and Zacatecas, washed away railroads and left for the capital no railway communication with the outside world except by the line to Vera Cruz.——A report has been published, and denied, that the Intercontinental Rubber Company, in which ex-Senator Aldrich and Thomas F. Ryan are interested, has sold its factories at Torreon and elsewhere, and its guayule plantations, for $30,000,000, to the Maderos, who have invested large sums in the industry.

Central America

At the recent municipal elections in the Republic of Panama, on the 30th ult., the supporters of Dr. Belisario Porras, a candidate for the Presidency at the election to be held on the 14th inst., were successful in fifty of the sixty-two districts, having large majorities in Panama, Colon, and other towns. These elections were supervised, at the request of both parties, by United States officers, under the direction of Minister Dodge, Colonel Goethals, and Colonel Greene. There was no disorder. The leading newspapers commended the behavior of the American guards, but a paper representing the interests of President Arosemena complained that they had prevented a free expression of the popular will. On the night of the 4th, American marines and civilians celebrating the anniversary in Panama were attacked by the police. One American civilian was killed, and eight marines and two American civilians were wounded. Two of the marines are mortally injured. The marines were unarmed. An investigation is in progress.——It is reported that the Nicaraguan Government, resenting the refusal of our Senate to ratify the loan convention, and being sorely in need of money, will seek a loan in Europe. It is also said that the New York bankers who recently advanced $1,500,000 (which has been used in establishing a national bank and in improving the currency) will give relief by purchasing the Government's railroad.——

Costa Rica asks our Government for the services of army engineers, to be used in developing a Pacific port in that country.——The recent earthquakes in Costa Rica were followed (in tropical midsummer) by snowstorms. Rivers overflowed their banks and several villages were destroyed. Congress has appropriated a relief fund of $500,000.

European Diplomacy The meeting of the German and Russian Emperors at Baltischport July 4 is generally regarded as a very significant event, tho correspondents are not agreed as to what it signifies. Both Emperors are accompanied by their premiers, foreign ministers, ambassadors and other leading officials of the Government, the army and the navy, and it is assumed, therefore, that the visit is not purely social, as it is stated to be, but that the questions of the termination of the Turco-Italian war and of the attitude of Russia in case of a war between England and Germany are under discussion. The Kaiser and Prince Adalbert are on the royal yacht "Hohenzollern," which is anchored in the harbor alongside the Czar's yacht "Standart." ——That Russia is determined upon rebuilding the navy destroyed during the war with Japan is shown by the action of the Duma in voting for a naval program involving the expenditure of nearly $650,000,000 in the next five years. This exceeds even the liberal German appropriation of $103,750,000 a year and is expected to give Russia a larger navy than any other nation except Great Britain. The four Dreadnoughts now building in the Baltic will be ready in 1914, and the three on the stocks in the Black Sea will be launched in the following year. Four more are soon to be under construction.——Norway also has become ambitious for a greater navy, and the Storthing by a large majority voted an appropriation of $5,000,000.——The Portuguese Government, which, on the establishment of the republic, withdrew its ambassador from the Vatican, has now decided to renew diplomatic relations, and both houses of parliament have voted in favor of such action. The cause of this change of policy is surmised to be the fear that Germany will seize some of the Portuguese colonies or that Spain will support an attempt to restore the monarchy. Captain Couciere, who led the previous attempts, is reported to have collected another force on the Spanish frontier and to have led a force of 400 royalists across the line into northern Portugal. It was, however, easily repelled by the republican troops.

French Labor Difficulties Disruption of the connecting links between ships and docks is at the present time the ailment common to many lands. In New York City transatlantic vessels are unable to leave at their appointed time on account of the crews going on strike at the last moment. In England the King has decided not to visit the East End for the purpose of cutting the first sod at the Royal Albert Dock Extension on July 17, for fear the open disaffection of that section might give rise to some unfortunate incident. The dock strike at London is still unbroken, altho the authorities are able to preserve order sufficient to secure the unloading of food supplies and their transport to market. In France the seamen who have been on a strike since June 18 are now being joined by the dock laborers of Marseilles, Dunkirk, Havre and other ports. At Havre the combined forces of seamen and dockers seized a steamship, and after being expelled from it by the police barricaded themselves on the docks. When attacked by the police and soldiers they defended themselves with bricks and stones and when forced to retreat threw up barricades of furniture in the streets. Troops have been sent to Havre from Rouen to restore order. The transatlantic liner "Savoie" was unable to leave Saturday on account of the strike. At Cherbourg the dockers struck on the arrival of 1,300 mail bags for New York, which should have been sent from Havre, but had been forwarded to Cherbourg in the hope of getting them off there. At Bordeaux also a conflict took place between the strikers and the police on the arrival of the steamship "Magellan." The strike of the French seamen was primarily for the purpose of securing higher wages. The navigation companies offered an increase averaging

10 per cent., but this compromise was rejected. The employers declared that the proffered increase would mean to them an expenditure of a million dollars a year, not counting the additional contributions necessary to the insurance and pension funds, and that it would be impossible for them to make a greater sacrifice in the interests of peace.——The Chamber of Deputies has passed a law establishing a ten-hour day for the employees of factories and business houses. The advocates of the measure wished it to be made general for all industries and establishments and still hope for such a measure in the future, but for the present they have been obliged to consent to a compromise which excludes from the operation of the law minor and domestic industries. The question of where the line should be drawn was the cause of much controversy. The bill was at first amended to exclude those industries where customarily fewer than twenty workingmen were employed in the case of hand work establishments and fewer than ten if power was used for the machine. The committee on labor to which the bill was referred cut the exemption down to five adult laborers, but when the bill came back to the Chamber it was raised to ten, in spite of the opposition of the Minister of Labor, M. Leon Bourgeois, who held that an establishment where ten adults were employed was not a domestic industry, but a real factory. The Government, however accepted the amendment, because, as was frankly stated, the measure was regarded as merely a temporary one, to be replaced later by a law which made no such exceptions.

Foreign Notes

Lord Mersey's report upon the loss of the "Titanic" declares that the speed of the vessel was the direct cause of the accident, and that Captain Smith might have slowed down his engines and made two or three knots less. It is the opinion of the court that a greater number of passengers might have been saved if the crew of the "Titanic" had been better organized and trained, and that the officers should have filled the lifeboats to capacity. The "Titanic" is declared to have left port a seaworthy ship, and therefore neither the owners nor designers are open to criticism. J. Bruce Ismay, managing director of the White Star Line, is commended for his work in the rescue of the passengers. The report recommends that all vessels be equipped with Marconi apparatus, with operators constantly on duty, and that lookout men should be stationed at the stem head as well as the crow's nest. The lifeboat regulations of the Board of Trade are declared antiquated and inadequate.——On account of the outbreak of the foot and mouth disease all importations of cattle from Ireland to England, Scotland and Wales have been prohibited. The disease originated in Dublin and has already infected several localities in England.——The Liberals have determined to put up candidates for the Parliamentary seats of Hanley and Crewe, notwithstanding the protest of the Laborites, who declared that these seats rightfully belonged to their party. The Labor leaders declared that if Liberal candidates were brought forward their whole representation of forty-one members would be withdrawn from the House of Commons and sent to these districts for electioneering. Finding, however, that the Government would not yield, they modified their attitude and decided to withdraw only such members as were actually needed in the campaign. The Government can dispense with the Labor votes so long as the Irish contingent remains loyal. The Home Rule bill is expected to be pushed thru during the fall session.——The trial of the Camorrists at Viterbo, which has been going on for two years, is apparently reaching an end. President Bianchi concluded on July 6 his charge to the jury, summing up the testimony given in the trial for the murder of Gennaro Cuocolo and Maria Cutinelli Cuocolo in June, 1906, and the jury is expected to render a verdict this week.——In the Olympic games now being held at Stockholm the 100 meter race was won by Americans, Ralph Craig, of Detroit, being first; A. T. Meyer, of New York, second, and D. F. Lippincott, of Philadelphia, third; time, 10 4-5 seconds. The Pentathlon, which is designed to test all-round ability and consists of a running broad jump, throwing the javelin, 200 meters run, throwing the discus and 1,500 meters run, was won by James Thorpe, of the Carlisle Indian Schools.

Coming into Court with Clean Hands

BY SAMUEL D. McCONNELL, D.D.

AT the last meeting of the Episcopal Church a very strong commission was appointed upon "Faith and Order." The purpose is to confer with the Churches of the world with a view to reaching some agreement upon the fundamental requisites in faith and order for a reunited Church.

As the commissioners are about to go abroad to make their appeal to the world court it may be well to raise the question whether, as things are, they can "come into court with clean hands." And this is a question which concerns, in one way or another, every Church which may appear in such a conference. I speak here, naturally, of my own Church alone; but I do this with the hope that others may speak for their own with equal candor.

The ultimate aim of the movement is the unification of the religious forces of the world, which are at present confessedly broken, divided and consequently impotent.

This division is assumed to be due to a disagreement concerning two questions:

(1) What is the true and essential belief of Christianity?

(2) What really and essentially makes a man a minister in the Church of Christ?

Our commissioners go as the representatives of our Church. They cannot go beyond or outside their credentials. This being the case, what can they and what can they not say?

So far as faith is concerned it will probably be alleged that their instructions are clear. It is now a good many years since our House of Bishops declared that acceptance of the Apostles' and Nicene Creeds and of the Holy Scriptures as the Word of God is sufficient.

But, in the first place, it is clear that this *obiter dictum* has no validity so far as this Church is concerned. No final authority is lodged in any one bishop, or in all of them together, to pronounce what the doctrine of this Church is. Their pronouncement has never, so far, been ratified or accepted by the Church.

Moreover, it is pretty clear that it could not be. By the majority among us it is thought to contain too little; by a great many it is thought to embrace too much. This Church has not yet pronounced what is essential to the faith of a reunited Church, or what is the nature or kind of subscription to it necessary to admission thereto.

This being the case, it would seem to be open to the commissioners only to secure information for use in some future action by this Church. They may ascertain, if they can—and if they can find any one with authority to speak—what doctrinal formula would be satisfactory to other Churches. I have little hope that they will be able to do so.

Moreover, I have little wish that they should do so; for the reunited Church of which we dream and for which we long will never be organized about a creed at all. The "faith" will be what it was at the beginning, not a set of propositions addrest to the intellect, but a determination of will to follow in "His Way." Any man thus well willed will be welcomed gladly. As he continues to do His will he will learn of the doctrine.

But this must be done in the main, each man for himself, and no man will ever be able honestly to state his belief in terms set by another, least of all in the compromise phrases of a council. The Church of the future will be one of free men in Christ. It was long ago pointed out that the two verbs which express the life of a Christian, believe and love, have neither of them an imperative mood.

In any conference, therefore, upon faith and order, it will be well to keep in mind what faith really means. If it be taken to mean formulated statements of doctrine, the movement is doomed to failure. For men can agree to act alike,

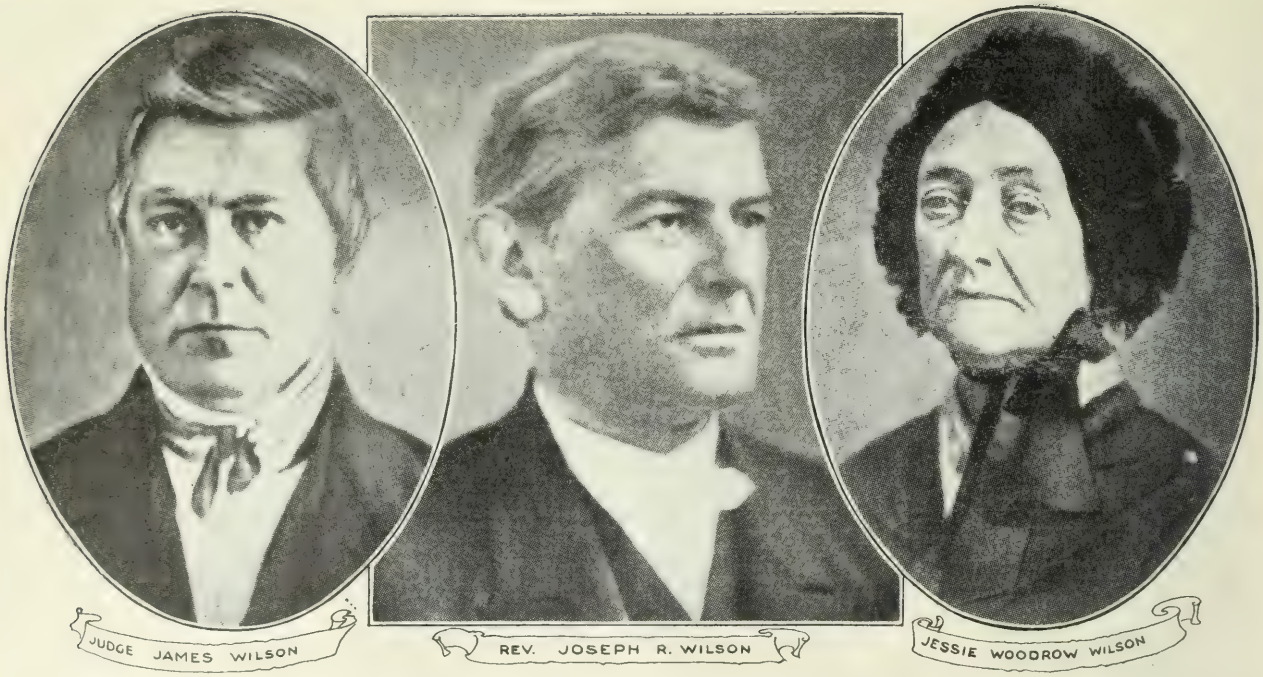
but they can never agree to think alike. If a reunited Church organize itself about a formulation of doctrine—even supposing that it could agree upon it at the outset—it would surely disintegrate in the future, as it has done repeatedly in the past. If for no other reason, this would come about because the wit of no one generation can devise terms which will satisfy the generations which come after.

But the greater difficulty is with order. It is a sad and depressing fact that the apparently insuperable barrier against Church unity is the ministry. The office which, one would think, should bind the disciples together, is the obstacle which holds them asunder. If it were not for the clergy the laity could heal their differences tomorrow. In point of fact they do fraternize and cooperate until some juncture occurs when it is necessary to recognize officially a minister. When that occurs they are obliged to separate.

It is here that our commissioners must find their hands tied and their tongues dumb. There is no other aspect in which our Church is so unsatisfactory. In theory we recognize our own ministry, the ministry of the Roman Church and of some of the Oriental Churches. But neither Roman nor Greek will acknowledge us. And we in our turn will not acknowledge the Protestant Churches about us.

In this way it happens that we are shut out by some of our neighbors on the one hand, and we shut ourselves out from other neighbors on the other hand. When a Roman priest comes to us we do not reordain him, but Rome deposes him; when one of our clergy goes to the Presbyterians, for example, they do not reordain him, but we depose him! Could any conceivable state of things be more unchristian, or more preposterous, than this?

And what have we done to correct it? Nothing. It may be asked: "What could we do? We are bound by what we believe to be a regulation of Christ that none shall be accounted a minister except he can trace his official ancestry thru a bishop to an Apostle. But where is such a law written? When was it promulgated? And by whom?



It is true that this is a *regulation* of our Church; but what other sanctity has it? Why, for instance, should we depose one of our ministers who has become the pastor of a Presbyterian or of a Lutheran congregation? Because he "has abandoned the communion of this Church"? Has he? If he choose to come to the communion at one of our altars thereafter who shall say him nay? Has he not a right? No one will say that his deposition carries excommunication with it. Is he not still "in communion"? What purpose does his deposition serve but to give a wanton and gratuitous offense to the Church where he is, for the time being, serving?

Of course it may be argued that for us to acknowledge the ministry of the Protestants on the one side would make forever impossible our recognition by the Roman and Greek churches on the other. To this I reply: It would not make it one whit more unlikely than it is as things are now. On the contrary, it may well be believed that a united and solid Protestantism would find it possible to make much better terms at Rome —if such a thing were possible at all— than small and separate organizations acting separately can ever hope or wish for.

For all these reasons one could wish that our commissioners, as well as those they meet, could enter their conferences with more confidence that they represent the churches for which they speak, and that the conferences should be deferred until all the conferees be instructed what to say.

The consoling thought, however, is that they, in their personnel, do, at any rate, carry the spirit and temper of the Master.

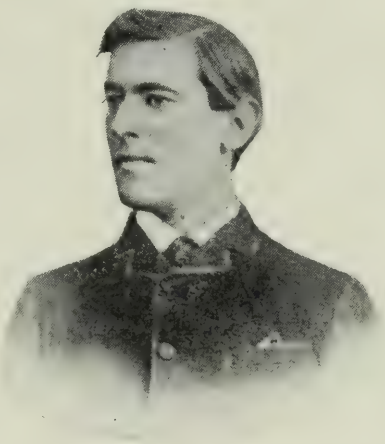
PHILADELPHIA, PA.

WOODROW WILSON.

BY HESTER E. HOSFORD

[We consider ourselves fortunate in being able to offer our readers this week the following sketch of the Democratic candidate for President of the United States by no less an authority than the author of "Woodrow Wilson and New Jersey Made Over," reviewed in THE INDEPENDENT of June 27. Miss Hosford is a graduate of the University of Michigan and for the past six years has been at the head of the Department of Literature and teacher of Civics in the high school at Orange, N. J. It was her good fortune to have been a member of Governor Wilson's household at Sea Girt on the day when he was nominated at Baltimore. Many of the illustrations accompanying this article are from family portraits hitherto unpublished.—EDITOR.]

NO butler in livery greeted me at "the Little White House," in Sea Girt, N. J., where I had the honor of being a guest at luncheon on the eventful day of the nomination of Jersey's militant, conservative-progressive Governor for President. "Sam" Gordon, an educated colored man, whose duties usually keep him at the Trenton State House, met me at the door. I speak of "Sam" because he said to me a few weeks ago: "I have been the attendant on the staff of every Governor of New Jersey for more than forty years, and there has never been one of them, before Governor Wilson, who had such an unselfish spirit; no—nor the patience, nor self-control. I never knew any man like him."



The dignity and self-composure of this now acknowledged champion of democracy is reflected in the deportment of every member of his family.

To be sure, on this occasion, with the news of the forty-fifth ballot coming in from Baltimore, the report that "Illinois had gone over to Wilson," and that others were coming rapidly, there were some ripples of excitement in the Wilson home. Mrs. Wilson extended her hand and remarked in a sweet, gracious way: "We have good news." Miss Eleanor Randolph Wilson, the Governor's youngest daughter, was enthusiastically recording her father's votes, as the messages were brought in by the Secretary. Her sister, Miss Jessie Woodrow, listened with complacent but confident satisfaction, while Miss Margaret, the eldest of the trio, actually shouted with glee. And yet, beneath the surface, a keen observer could discern that each of the interesting women present was conscious of the great contest in progress and of the responsibility which the outcome might bring to her. This was especially noticeable when Governor Wilson himself appeared in response to

the call to luncheon, served at a long table on the deep veranda of the Sea Girt cottage. Seated at his right, I studied his countenance—this time more thoughtful, grave and serious than I had ever before seen it. I recalled that on the night when the Baltimore tumult was most intense, mine host had been deeply absorbed in reading "The Life of Gladstone." I remarked that a lack of emotion at so crucial a time seemed most extraordinary. The Governor replied:

"Yes, an elastic temperament combined with a Presbyterian creed, will do much for a man, in any crisis. I have not felt any of this as if it were a thing that centered on myself as an individual. The fine men who have been fighting for me in Baltimore I have not regarded as my representatives. I have felt all the while that they were honoring me by regarding me as their representative and that they were fighting for me because they thought I could stand for and fight for the things that they believed in and desired for the country. I do not see how any man could feel elation as such responsibilities loomed nearer and nearer to him, or how he could feel any shallow personal pride."

The modest woman who sat opposite the now chosen standard bearer of the Democratic party reveals in every word and glance that she is a lady of quality.

DR. WILSON AS PROFESSOR AT WESLEYAN UNIVERSITY

The natural composure of both Governor and Mrs. Wilson during this intensely interesting hour bespoke the culture of centuries. The conversation at table, animated and brilliant, was frequently interrupted by flashes of convention news, and, as each message brought better news than the one which preceded it, every one became more thoughtful and talked less. By the time we left the table groups of photographers and newspaper men were waiting outside.

Governor Wilson was posing for a photograph with his wife and daughters when he was informed that Underwood had withdrawn. "Well, I declare," said he, "that will give me enough votes if they all go to me."

In a few minutes the official secretary brought the news of the memorable forty-sixth and final ballot. "Have you told Mrs. Wilson?" queried the Governor.

"No, sir, I came first to you."

"Please tell her at once," he calmly said.

For a few minutes after the Governor, Mrs. Wilson and their daughters were missed. When they returned the Governor said:

"The honor is as great as can come to any man by the nomination of a party, especially in the circumstances and I hope I appreciate it at its true value; but just at this moment I feel the tremendous responsibility it involves, even more than I feel the honor. I hope with all my heart that the party will never have reason to regret it."

Those who are familiar with the long records of ancestral achievement in both the Woodrow and the Wilson families, and who have taken pains to inform themselves concerning the good doctor's virility as an educator and statesman, believe that the Democratic party will never have cause to regret the choice of Woodrow Wilson as the nominee for President, and in the event of his ultimately being chosen to lead the nation, true Americans, regardless of their political creeds, need have no apprehensions.

We find first that Dr. Wilson's hereditary qualifications bear as much strength to the square inch as those of any man who ever sat in the Presidential chair, tho seldom can he be induced to talk of his ancestry; for he is first of all a Democrat both with a big and a little D.

In my study of Governor Wilson and his antecedents, I have been gratified to discover that he lives up to his traditions and not on them.

He is the son of Jessie Woodrow and Rev. Joseph R. Wilson. His father was a distinguished scholar and clergyman of the Presbyterian Church of the South and for many years a professor of the theological seminary at Columbia, S. C., closing his career as professor in the Southwestern Theological Seminary, at Clarksville, Tenn. He was a native of Ohio, but was called by his Church to the South long before the Civil War, and

WOODROW WILSON'S BIRTHPLACE
The Presbyterian Manse at Staunton, Virginia

during that great struggle resided at Augusta, Ga. Jessie Woodrow was born in Scotland. In fact, the Governor's lineage on both sides is Scotch-Irish. The Woodrow family was for centuries distinguished in the literary and church life of Scotland. Governor Wilson's mother was an ardent church-worker and a zealous helpmeet.

"That is best blood that hath most iron in it." Scotch-Irish blood has always contained plenty of red corpuscles, and when sustained by the oxygen of a Southern atmosphere, impregnated with a love of justice and freedom, these corpuscles are not likely to become depleted, particularly when stimulated in their early existence by the privations incident to a long period of bloodshed and dreadful days of reconstruction. Woodrow Wilson retains vivid recollections of his boyhood and youthful days when the Civil War and its consequences brought suffering and hardship to the Wilson family. For Rev. Joseph Wilson was not the man to accept any sacrifices made by his parishioners when he could himself produce a means of support. During the war he continually relieved the members of his congregation from the obligation to provide for his comfort by eking out his income with the profits from his small but well cultivated garden at the rear of the Presbyterian parsonage in Augusta, Ga.

Last fall I interviewed James Sprunt, British vice-consul, one of the oldest and most conservative citizens of Wilmington, N. C., who has known Woodrow Wilson from boyhood, and who knew his parents intimately. This distinguished Southerner, who weighed very carefully every word which he uttered, said:

"From a boy, Woodrow Wilson was a thinker and scholar. His mind was much beyond his years and no one who knew him was surprised by his later achievements. He came honestly and naturally by his great qualities of heart and mind, for his father whose memory we revere, and his sainted mother, were not of common clay. The father was a giant in physical and mental proportions, and his mother was one of the brightest and best of women. I admire Governor Wilson, and I am proud of his record in public life. His

WOODROW WILSON, GOVERNOR OF NEW JERSEY.

leadership in our political affairs would mean much for the good of the American people. His great learning, his exact scholarship, his balanced judgment, his rugged honesty, and his profound knowledge of political science, place him, I think, far above all other prominent Democrats, as the reform candidate for President."

Naturally, Woodrow Wilson's parents, who appreciated his studious inclinations, gave him the advantages of the best tutors and schools. "The spirit of a youth who means to be of note begins betimes." Before he was eighteen years

of age young Wilson had received in the private schools of the South the foundations of a liberal preparatory education. He entered the freshman class of Davidson College, a Presbyterian institution at Davidson, N. C., where he remained only one year, when he decided to enter Princeton University on account of the larger opportunities which the courses of study there presented. In 1879, Mr. Wilson received his A. B. degree from Princeton, with the Phi Beta Kappa honor. Leaving Princeton, Wilson spent two years at the University of Virginia Law School, where he captured the medal in oratory awarded by the Thomas Jefferson Literary Society. Two years of professional law practice, in Atlanta, Ga., proved to him that the theory and principles of legal science engaged his interest more than did the business side. In 1883, Wilson decided to return to his studies. He went to Johns Hopkins University, where he later received a Ph. D. degree in recognition of his thesis on "Congressional Government," which became a standard text-book in many high schools and colleges, and won cordial recognition in many foreign countries.

Now begins Wilson's career as an educator. He became, in 1885, Professor of Political Science in Bryn Mawr College, Pa. He was one of the original faculty of this institution and helped to organize its courses of study. From Bryn Mawr he went to the chair of History and Political Economy at Wesleyan University, Middletown, Conn. While here he was appointed Professor of Jurisprudence and Political Economy at Princeton University, where he entered upon his duties in 1890. He soon became one of the most popular professors in that institution. His work as a member of the committee on discipline attracted the attention of every other member of the faculty and of the board of trustees. Besides, Professor Wilson was a voluminous writer. His textbook, "The State," had appeared while he was at Wesleyan, and it has had the rare distinction of serving as the accredited text in more than one hundred universities, including Oxford University, England. MRS WOODROW WILSON

The wife of the Democratic choice for President was Miss Ellen Louise Axson, of Savannah, Ga. Four generations of the Randolphs, one branch of her family, lived in Princeton; Fitz Randolph being one of the donors of the Princeton Campus. Mrs. Wilson is a housewife as well as a Governor's Lady. When the news of her husband's nomination came to Sea Girt, one of her first acts was to put the newspapers and books in the reception room to rights.

and Reunion," "An Old Master and Other Political Essays," "Mere Literature" and "Life of Washington," were published during his professorship at Princeton. "The History of the American People," in five volumes, his masterpiece, came out in 1902, the same year in which Doctor Wilson was unanimously elected president of Princeton University. When he assumed his du-

ties he found the courses of study too numerous and complicated. His first reform stroke was to systematize four well-defined courses leading to four distinct degrees. Higher standards of admission and of routine scholarship were now established. Now for Doctor Wilson's second stroke. This consisted of the introduction of the preceptorial system, which brought an innovation. By

MISS JESSIE WOODROW WILSON

This daughter of the New Jersey's executive is a graduate of the Woman's College of Baltimore. Her interests lie in sociological work. In Philadelphia she has helped to make the church settlement called "The Light House" one of the most successful in the United States. She was recently elected a member of the Board of the National Y. W. C. A.

this plan sixty-five new men were added to the faculty, and to each of them groups of students, numbering from two to five, were assigned for personal supervision. As described by Dr. Wilson:

"The object of this arrangement was to draw the faculty and the undergraduates together into a common body of students, old and young, among whom a real community of interest, pursuit and feeling would prevail."

This intimate intercourse of personalities produced most satisfactory and

permanently successful results, and made the labors of those who took part in the work not tasks, but delightful pursuits, which led to the natural enjoyment of science and letters.

The next feature of President Wilson's college administration to attract attention was his proposal to introduce the quadrangle system, which plan was, in its inception, wholly an educational

project. It was not until the opposition of privileged individuals had blocked this scheme that this educational policy was seen to have been opposed by the same kind of influences which seek in political life to uphold special privilege.

The upper class clubs at Princeton, of which there are over a dozen, have handsome properties and are essentially the counterparts of the social clubs in any great city. Naturally, as their membership includes only about one-half of the two upper classes, and as their standards of maintenance put them beyond the reach of students of limited means, a line of cleavage is sharply drawn between the club members and the non-members. It was Dr. Wilson's plan to reinvigorate intellectual interests by instituting a process which would not annihilate the clubs, but which would reorganize them on a basis of democracy, where all students might enjoy their advantages. This he proposed to do by annexing the clubs to the university, which was to control them and make their usefulness universal. The club-houses were to be maintained in a comparatively economical way, under the administration of the university; and each unit was to house and board about one hundred men of all four classes, with an admixture of the teaching force, in modest comfort but without luxury. This plan, when first presented to the Board of Trustees, was adopted with only one man dissenting; but the summer following the trustees' decision the wealthy members of the university alumni clubs brought so much pressure to bear upon the university board that Dr. Wilson was requested to withdraw the quadrangle plan. This he did, but with keen reluctance. From this time on Dr. Wilson had to fight continually for democratic standards. He politely assured some estimable gentlemen that, because they gave money to the institution, they could not dictate the academic policy. The social life might be governed by plutocracy, but the classroom standards must be kept democratic so long as Woodrow Wilson was the academic head.

When Dr. Wilson resigned the presidency of Princeton, after he had accept-

GOVERNOR WILSON REVIEWING THE NEW JERSEY MILITIA AT SEA GIRT LAST MONTH

ed the gubernatorial nomination, in 1910, he left behind him a record which gave him the rank of America's foremost living historian in that field which deals with the political and social development of the nation. Princeton under his administration had grown more rapidly than ever before; and the retiring president left its affairs in a most prosperous and flourishing condition. He had proved himself a *constructive* educator. Now he was about to prove himself a *constructive* statesman.

Has he made good? Let us examine his political record. For more than a half century the people of New Jersey had lacked the virility and the means to assert their political independence. At last the political bosses of the State miscalculated and nominated for Governor the "scholar in politics," whom they believed to be a mere theorist, incapable of outwitting the practical politicians. But the people believed that the voice of Woodrow Wilson rang true. They elected him. He became their State spokesman. He stimulated the members of the New Jersey Legislature to a consciousness of their responsibility, until there was enacted into law one of the most remarkable programs of legislation which have ever distinguished a single legislative session in this country. Because Woodrow Wilson is Governor of New Jersey we have on our statute books a real direct primary law; an adequate public utilities law, with "teeth in it"; an admirably successful employers' liability law; an efficient corrupt practices act, and numerous other humanitarian reform measures, including the regulation of cold storage, with a ten-month limit; the substitution of indeterminate sentences for criminal offenses; the rectification of abuses in connection with false weights and measures; the reorganization of the State's school system; the abolition of contract labor in our penal institutions; the legislation in the interest of the blind; the regulation of the age, employment, safety, health and work-hours of persons employed in mercantile establishments; an act for the safeguarding of buildings against fire; a law compelling all railroad corporations to pay their employees twice monthly; a law extending the civil service to employees of the State, counties and municipalities; and an optional commission form of government act for cities, under what was known originally as the Galveston plan. The signal achievement of Woodrow Wilson, I believe, is that he has, thru his example,

THE LITTLE WHITE HOUSE AT SEA GIRT

This mansion in the Colonial style is the property of the State of New Jersey and has in recent years served as the summer residence of the Governors of the State. It was here that Dr. Wilson received news from Baltimore day by day and on July 2 word of his nomination for President

elevated the tone of public office to correspond with the increasing dignity and power of the State and the nation.

We may apply to him Carlyle's immortal words:

"The man of intellect at the top of affairs—this is the aim of all constitutions and revolutions if they have any aim, for the man of true intellect is the noble-hearted man withal; the true, just, humane and valiant man. Get him for governor, all is got. Fail to get him, tho you had constitutions plentiful as blackberries and a parliament in every village there is nothing yet got; we shall either learn to know a hero, a true governor and captain, somewhat better when we see him, or else go on to be forever governed by the unheroic; had we ballot-boxes cluttering at every street corner, there were no remedy in these."

Thomas Ryan Marshall

BY MARY H. KROUT

[Miss Krout is a journalist, and has served on the editorial staffs of Crawfordsville, Terre Haute and Chicago newspapers. She has also acted as a Chinese correspondent of the New York *Tribune*, and is the author of "Hawaii and a Revolution," "A Looker-on in London" and other books, including a life of Gen. Lew Wallace. As a resident of Governor Marshall's home town, she has had a rare opportunity to learn the qualifications of the Vice-presidential candidate.—Editor.]

WITH the nomination of Governor Thomas R. Marshall for Vice-President by the Democratic party, Indiana will have furnished five candidates for this important office. The first was George W. Julian, with John P. Hale as candidate for President, in 1852; Schuyler Colfax in the first candidacy of General Grant, 1868; Thomas A. Hendricks, on the ticket with Samuel J. Tilden, in 1876; William H. English, with Gen. W. S. Hancock, in 1880; Thomas A. Hendricks, nominated a second time, supporting Grover Cleveland in 1884, and Charles W. Fairbanks, with Theodore Roosevelt in 1904. In every instance the nomination was made in deference to the voters of the Middle West in general, and to the Hoosier State itself, with its important quota of fifteen electoral votes, a factor too vital to be disregarded where the vote fluctuates from one election to another—a status that has remained unchanged since 1868.

For these reasons—the number and instability of its electoral vote—Indiana has been regarded as the pivotal State, the final result depending largely upon its decision. That this is true was sufficiently proved in the Baltimore convention, two of the strongest men in the Democratic party in Indiana having been brought forward as candidates. Mr. Kern has had wider experience in office-holding, is personally influential, and his record in the United States Senate has inspired the progressive element in his party with confidence in his judgment.

Governor Marshall, on the other hand, while always an active and enthusiastic Democrat, had never aspired to office. He has helped in the canvass with zeal and energy, but has sought no reward for his services, his nomination as Governor in 1898 being probably as great a surprise to himself as it was to the rank and file of his party, and even to his close personal friends.

He is an admirable "mixer," not because he is looking for favors, but because he has a sincere liking for people—people of all classes, politics and religions, and in his various contests he has needlessly wounded no man's feelings, and has never allowed his religious or political preferences to affect his personal friendships.

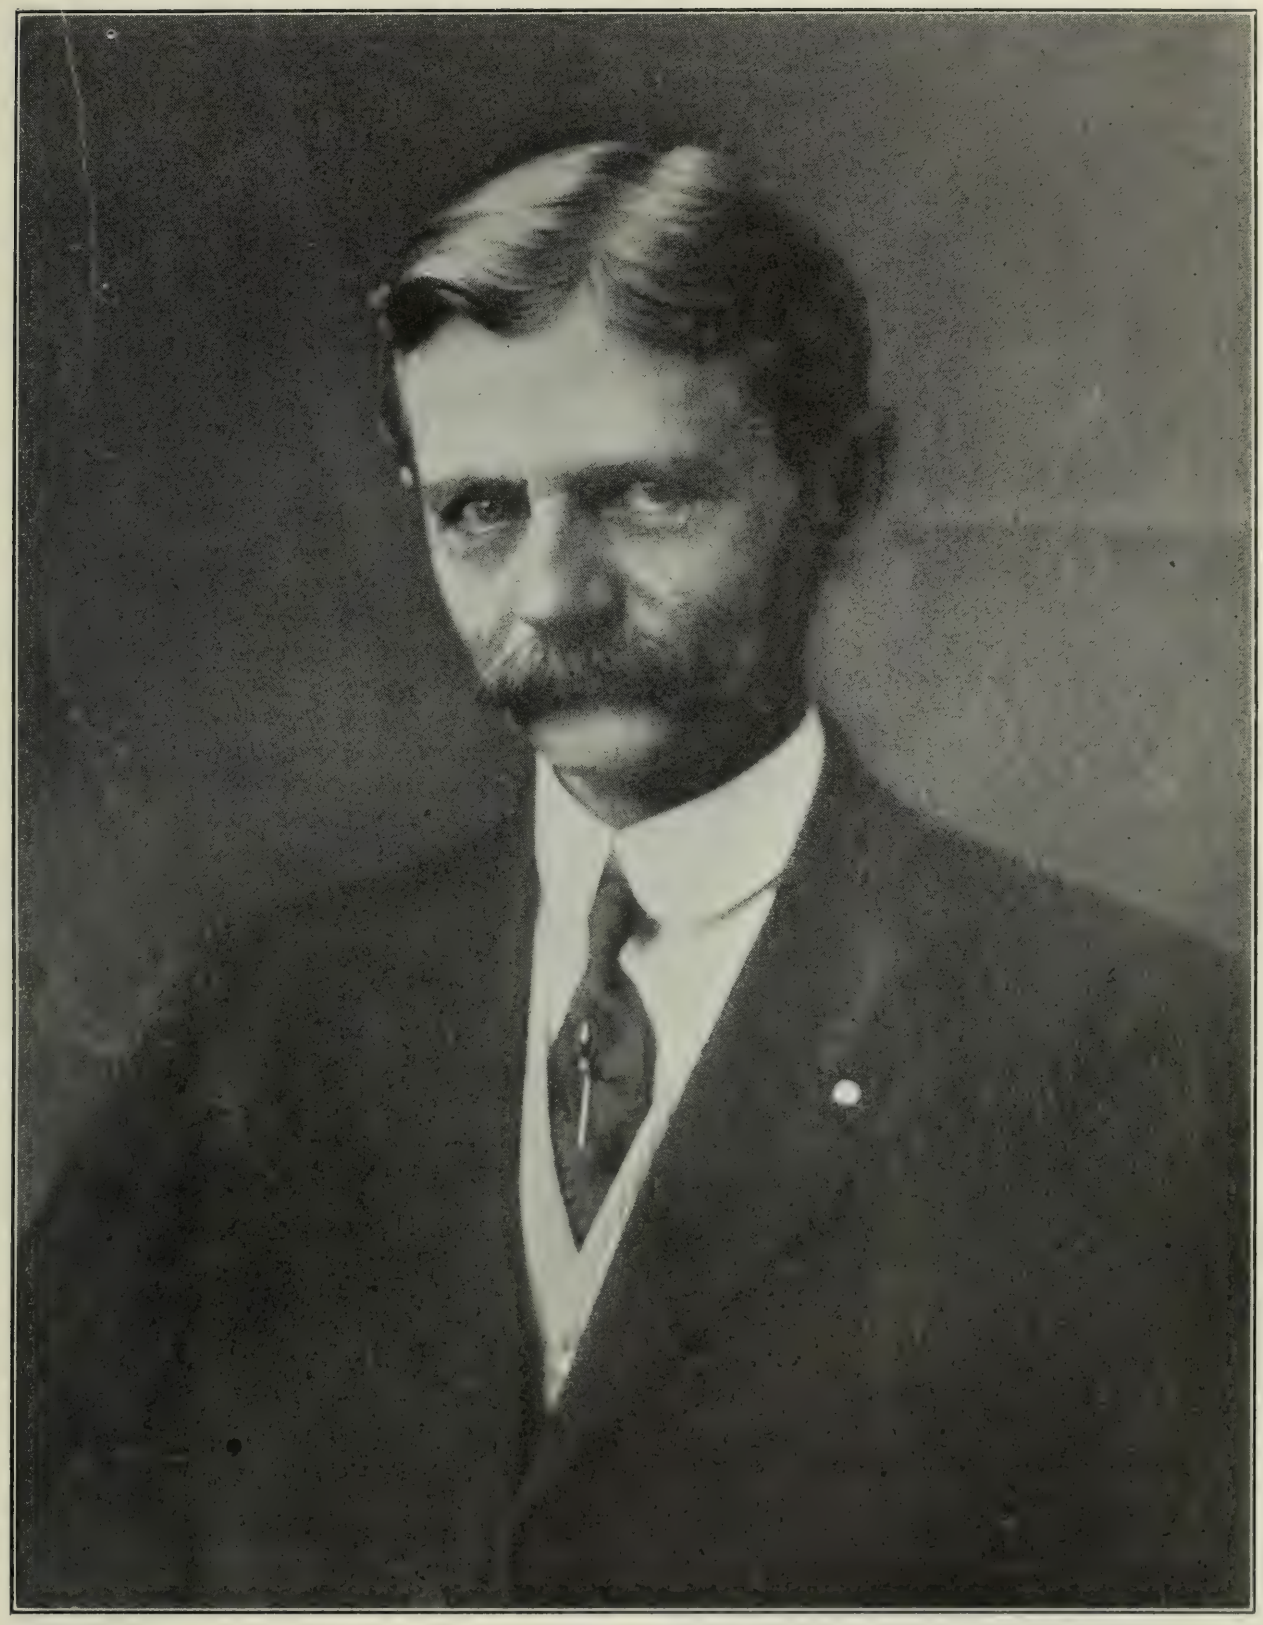
Thomas R. Marshall was born March 14, 1854, in Manchester, Ind. His father was Dr. Daniel M. Marshall and his mother was Martha A. Patterson, both parents being descended from distinguished American families. On his father's side was Chief Justice John Marshall, the Revolutionary patriot and jurist. His grandfather, Riley Marshall, like scores of other emigrants who have given Indiana its distinctively Southern bias, came from Virginia and settled in

Grant County, where he owned 600 acres of land, upon part of which the town of Marion now stands. On his mother's side he can claim relationship with Charles Carroll, of Carrollton, a signer of the Declaration of Independence.

His father, who was a physician, was an uncompromising Democrat of the Jeffersonian school. His mother was a native of Pennsylvania and was a woman of striking charm and of remarkable force of character. The son was an only child and was idolized by his parents. Both were deeply interested in his career, but the mother, especially, made his training and education her chief care, and even after he had grown to manhood, to her he was always the child, still dependent on her ministrations. During his college course she paid him frequent visits, greatly concerned in his class standing and proud of his success in even the smallest undertaking.

His father had been a strong adherent of Masonry and his mother was also very loyal to the order. She said to a friend that it was her great ambition "to see Thomas a good Presbyterian and a thirty-third degree Mason." She lived to see both desires realized.

The companionship between mother and son continued throughout her life, and, instead of regarding her constant interest in his affairs as irksome, it was a source of pride and gratification to him even when a lad—a period in life when maternal supervision is frequently irksome to spirited boys.



His home influences were of the best, and the training there, which was destined to exert a lasting influence on his after life, was strengthened in the excellent advantages which were afforded him in the public schools, which even then were excellent.

His education was completed at Wabash College, from which he was graduated in 1873 at the age of nineteen. He was a painstaking and thoro, rather than a brilliant student. A regard for details, for thoroly investigating whatever interested him, gave a forecast of his future career. He was as a mere lad a brilliant orator and was a leader in the debates of his college literary society—another evidence of what he was to do in his maturer years. He left college with a good record, both as to conduct and scholarship. But one prank has been treasured up against him, and that must be accepted as rather justifiable. He boarded in an excellent family. Behind the house was a flourishing orchard which yielded an abundance of fine fruit. The boarders—Tom Marshall, as he was always called, among them—soon discovered that the least desirable apples were being served to them. They bore it for a while, and at last decided to take the matter into their own hands and dispose of the specked apples so that they, at least, should have no more of them. They waited and found an opportunity, after a while, to raid the landlady's cellar. They were provided with such articles as could be used in carrying off the apples, Tom's being a thin and flimsy bolster case. As he was climbing the steps in the darkness the bolster case burst and the apples rolled down the steps with a clatter that roused the house. The raiders managed to escape without detection, and the specked apples appeared upon the table as before.

Upon his graduation he received the degree of Master of Arts, and subsequently the degree of LL. D. from Notre Dame (1909) and from the University of Pennsylvania in 1911.

After his graduation he began the study of law in Columbia City, where his parents then lived. In this profession he displayed the same qualities that he had manifested in his literary course—a patience and thoroness in mastering every detail of any subject he investigated—and, later, in his practice—a fidelity toward his client that made for him hundreds of devoted adherents—even in instances when the issue had not been successful. He was almost irresistible before a jury, his natural eloquence, combined with strong personal magnetism, carrying everything before him.

His cases were always prepared with the utmost pains, and it was a common occurrence for him to study all night long on some knotty point upon which he realized that the verdict might depend. Toward his clients, personally, he was not only a lawyer but a friend, and while he might score him roundly, as he deserved, yet when the man showed any

GOVERNOR THOMAS RYAN MARSHALL

signs of betterment he helped him in every way possible.

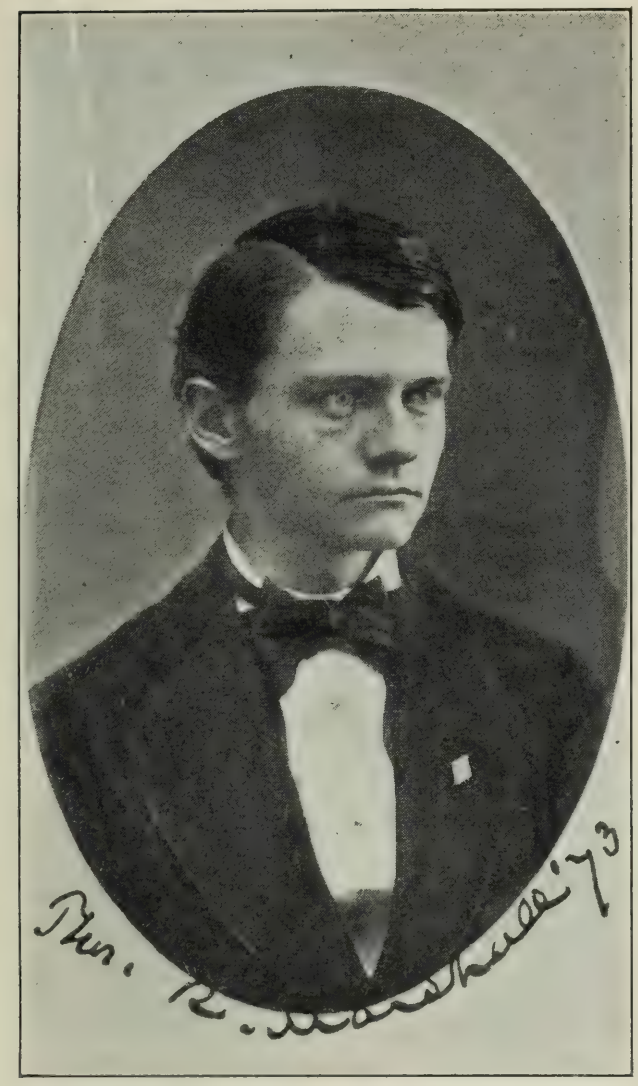
He had always a desire, as he exprest it, to "give the man a chance."

In his administration as Governor he has been sharply criticised for exercising executive clemency too freely, and this early bent of mind may account for it. His success in his profession was assured from the beginning of his practice, which soon spread thruout the southern, eastern and western parts of the State. Prior to his election as Governor he practised frequently in the Chicago

courts, where he soon became well known to the members of his profession.

In his own county no case of any importance was tried but that he was employed on one side or the other, and he was recommended by the Bar of Indiana to succeed Judge Olds on the Supreme bench. This, however, could not be brought about, the Republican party at that time controlling the appointment.

Governor Marshall's father died in 1889, and the bond uniting mother and son became closer than before. Until her death, about five years later, he made his home with her, and most of his leisure hours were spent in her companionship. In 1895, being then past forty, he married Miss Lois Kinsey, of Angola, an accomplished and beautiful woman, who has acquitted herself with much tact and grace as the wife of the Chief Executive of the State. She is a delightful hostess, cordial and simple in her manner, putting at ease all those with whom she comes in contact—a large and varied class, as goes without saying. Ever since her marriage she has accompanied her husband wherever his official or private duties have called him, and it is said that they have never been separated, even for a day. Governor Marshall has had in his wife a helpmeet in the truest sense of the term, and she has succeeded the mother as his close confidant and as an adviser upon whose counsel he relies.



THOMAS RYAN MARSHALL
From a tin-type taken when he was sixteen years old

While this is true, it may seem rather contradictory that Governor Marshall takes little interest in women's political aspirations. He has steadfastly refused to be interviewed on the subject, tho he has not hesitated to express in private his belief in the unfitness of women to take part in political life. Nor is he much in sympathy with their efforts to fit themselves for other professions not commonly followed by women, which tend to take them from their homes. Having peculiarly experienced the value of their work there, as exemplified in the lives of both mother and wife, it is not strange that he should place it before all other occupations—the foundation of all worthy society and stable government.

Mr. Marshall's election to the Governorship four years ago by a plurality of 8,000, in a State in which the balance between the two leading parties is usually very closely maintained, was due largely to his own personality, many who differed from him politically voting for him on the ground of simple good fellowship.

While he has been for a good many years a consistent Presbyterian, he has displayed as little narrowness in his religious convictions as he has shown in politics. All religious beliefs are respected by him, and in this liberality he has not discriminated against the Roman Catholic Church. In that body, indeed, he has found some of his warmest supporters. This has been exemplified in Father McEllering, the priest in charge of the parish at Columbia City. When Mr. Marshall's name was presented to the State convention in Indianapolis, he was there working for him with might and main. After the nomination he stumped the Catholic counties in the southwestern part of the State, and it

The photograph of the Governor at the age of nineteen, from which this portrait is reproduced, was presented by Mr. Marshall to one of his professors at Wabash College, with this inscription: "From your pupil, Thos. R. Marshall, who, though he has abused you much, sincerely regrets it, and loves you yet."

was due in great measure to him that so large a plurality voted for him.

Encouraged by his efforts at home, Father McEllering went to Baltimore—one of the earliest arrivals—not as an instructed delegate, of course, but as what is often a hundred times more efficient, a free lance. From the moment of his arrival he began his efforts on behalf of his friend, and this time had the satisfaction of seeing his nominee placed second upon the national Democratic ticket.

The fact that Governor Marshall has been the greater part of his life a staunch Mason, it might appear, would serve to alienate the Catholic vote, but this has not been the case. He received the thirty-third degree on September 20, 1898, and has held the offices of Grand Master of the Grand Council of Indiana and Grand High Priest of the Grand Chapter, and other important posts, and still retained the good will of the Catholic Church, at home and abroad.

It is a little remarkable that Phi Beta Kappa Society, to which he also belongs, should have been organized by his grand-uncle, John Marshall, and his associates, membership in which has always been regarded as the culmination in literary distinction. Loyalty to his friends and to the institutions with which he has been affiliated is a strong characteristic of the Governor, and ever since his graduation from Wabash College in 1873 he has returned for commencement whenever he could do so. Within the last two years, notwithstanding the demands upon his time, he has performed his duties as trustee of the institution with loyalty and efficiency.

While far from being a rich man, as wealth is now estimated, he has given generously to people and to enterprises, as has been stated, and many a young man, struggling to make his way thru

THE DEMOCRATIC NOMINEES
Governors Marshall and Wilson on the steps of the Union Station, Indianapolis

college, has been encouraged and aided by him. He seldom forgets a friend or a face, tho occasionally his memory needs a little stimulating. One incident will serve by way of illustration. He was attending the presentation of the Greek play which is a feature of the Wabash College commencement. It was given on the campus, in the open air, before a large audience, many of whom had come from a distance. Governor Marshall was a noted and interested spectator, and when the play—the "Alcestis"—came to an end, people gathered about him, and he held an informal reception under the trees. When there was a little break in the throng a lady stepped up to him and held out her hand. He took it, studying her face closely, and then remarked, rather embarrassed, that his memory for once had failed him.

"I am bound to confess that I cannot recall you."

She looked up at him with twinkling eyes, smiled, and then, by way of reply, quoted: *"Jam primum omnium satis constat."*

He caught her hands and exclaimed: "Why, C——! I'm ashamed that I did not know you. I gave you my Livy when I left college."

"You did," she replied, "and I read it —every word of it."

And while the crowd waited for a time there was an interchange of reminiscences.

CRAWFORDSVILLE, INDIANA.

The Spirit Shall Not Die

BY RICHARD BURTON

"Yet some men say that King Arthur is not dead, but had by the will of Lord Jesu into another place; and men say he shall come again and he shall win the Holy Cross."—SIR THOMAS MALORY.

ARTHUR, the peerless king, went out upon
The tide and left Sir Bedivere alone,
Who, reft of his liege lord, the well-beloved one,
Stood wailing by the marge and made his moan,
With Arthur all was well, but with his realm
Ill—now the lawless days drew nigh to whelm.

And many said that he would come again:
Haply they meant return in youthful might,
Girt up and ready to wipe out the stain
Of erring years, and trumpet in the right,
Which, he a-gone, had faded from the land,
So that it drooped beneath the heathen hand.

It is not thus he shall come back; yet truth
They spake who so declared; for all the deeds
He did were deeds of gentleness and ruth
And virtue, and whoever sows such seeds
Shall bring forth fruit again in spirit, him
Time cannot quell, nor death itself bedim.

Yea, Arthur shall return and still return,
Till all the earth's good souls are blent as one,
Till steadily in hearts of men shall burn
Love that shall leap like fire from sun to sun;
Return from Avalon, and evermore
Kindle the faith of those beside the shore.

MINNEAPOLIS, MINN.

The Bull Moose*

As a Political Totem

by William J. Long

[My Dear Editor—Yours is only one of many letters that have lately come to my desk from editors, lawyers and especially from progressive statesmen, all asking for an expert opinion on the bull moose as an emblem or totem of a new political party devoted to the public good. I am delighted to have your assurance that this pure and patriotic party has no self-seekers, no ambitious politicians, no plotters for revenge; that it has already exorcised all its devils and committed itself irretrievably to the society of the near seraphim. For such an organization the bull moose is, as you shall presently see, an almost perfect emblem.

At the outset, however, I must disclaim any expert knowledge of this interesting subject. I have met only three or four hundred moose, among them being a few that furnished something like a mild adventure; but I have had the good fortune to find in a second-hand shop an old volume, which tells all about the bull moose. It was written by one T. Roosevelt, who, you may remember, once had considerable local reputation as a naturalist, especially among federal office-holders whose positions were not secured by civil service regulations. I find upon examination that the esteemed author actually killed two bull moose that were not looking and chased three more that would not wait to be shot. He was also intimate with Hank Griffin, who once saw a moose somewhere out West. He speaks, therefore, with authority.

In the following essay I shall quote freely from his luminous pages, omitting only the bloody details. Very sincerely yours, William J. Long.]

THE bull moose lives on the public domain and is a very wasteful feeder. As T. Roosevelt well says,† "no beast is more destructive to the young growth of a forest." When his great paunch is full to bursting of the delicacies he has gathered from the common supply, he wanders toward his daybed, stripping the bark from tender young trees, especially of the rarer and more beautiful kind, like the mountain ash and the striped maple. His method is to strike his strong front feet into the bark and tear off a great strip by lifting his head. He chews a bit of this, only to throw it aside and strip another tree farther on. In trailing a bull moose one can often follow his course far ahead by the unsightly gashes or "peelings" which he leaves behind him. Another destructive method of feeding is by riding down young trees whose tops are above his reach. He straddles the trunk, bending it down by his great weight, holding it under his belly while he eats all the buds and tender twigs. A tree thus moose-ridden rarely recovers. It remains bent or broken, like a discarded boss; it cannot breathe without its leaves; it dies and the winter snows cover it from sight.

Such a destructive and useless beast would never be tolerated on private land or by a thrifty corporation. At one time he was of some small use to the early settlers, who killed him for food when they could find nothing better; but they could never depend upon him, as he is of a wandering and flighty disposition. His flesh, moreover, is coarse and stringy; his hide is thick and "of very poor quality," as T. Roosevelt says, and he ought to know. At the present time he is one of the luxuries of democracy, which supports and protects him that he may minister to the vanity of a few sportsmen, mostly of the tinhorn variety, who think it a brave thing to follow him

*Copyright, 1912, by The Independent.
†The Wilderness Hunter, p. 216.

and to hang his grotesque head in their houses; tho in truth it requires less courage and skill to kill a moose than to kill a cow that has run wild in the back pasture.

With such an emblem, the new party may well inscribe "Thou shalt not steal" upon its standard. The bull moose never steals; he simply takes what he wants. He has fed on public property so long that he considers it all rightfully his. I once planted a garden near my summer camp, and a bull moose used to come nightly to knock down the fence and eat every bean and pea vine that had ambition to show its head.

Our authority declares (p. 205) that the legs of a bull moose are so long and his neck so short that he must go "down on his knees" to crop the tender grass or to get a mouthful of snow to quench his thirst. This delusion was already hoary when I first found it in the geography. The bull moose does nothing of the kind. If he wants to crop or drink, he simply spreads his forefeet and bends his head, as any one may see who will follow a moose for an hour without trying to kill him. If, however, we consider him as the emblem of the new party of righteousness, in a world wholly abandoned to the evil "interests," we should by all means cherish this old delusion. The picture of the bull moose on his knees, in an attitude of grace as he eats and drinks from the public hand, is an admirable one. It will be especially significant if the new party has the wisdom to choose a leader of almost monopolistic virtue, who is more emphatic than Moses in the matter of the Commandments and who wrestles mightily in prayer before he goes out with his Gideon band of Flinns to fight the Lord's battle.

Perhaps the most noticeable quality of the bull moose is his shyness. He avoids the crowd and eschews excitement of every kind. When you find him you must be very still, else will his native modesty take him away out of your sight. Once I ran across a party of ladies, with their guides, who were eager to see a bull moose. At twilight I took two of them in my canoe, and was followed by the whole party in breathless expectation. When I called out the great bull, certain emotional ones could not restrain their admiration. One waved her handkerchief; another clapped her hands; a third cried out ecstatically. The moose, disdaining such applause, instantly turned and vanished into the solitude which he so deeply loves. As T. Roosevelt writes, "The bull moose is never found in a great herd, but always alone or in small family parties." In all these respects he is an excellent totem; he typifies the long-expected politician who shall settle all affairs himself, or in select tennis cabinets, taking no heed of courts or constitutions or the democratic rabble, which can only shout and vote and leave all else to the true leader.

Tho the bull moose is thus instinctively retiring, he has another side to his nature. At times he rampages violently thru the woods, exalting his horn, grunting, squealing, stamping the earth with his hoofs, and thrashing the unoffending bushes with his antlers. Meeting him now you would think him a champion, a Hotspur, a very devil of an antagonist; but he is at heart an arrant coward and braggart, without a spark of real—that is, of moral—courage. If he ever attacks it is in a fit of blind fury, like a cornered cat. He will roar defiance at all rivals and at the universe itself; but snap a twig sharply, or bark like a small dog, and all the rampant egotism oozes out of him. He remembers suddenly some very important engagement elsewhere, and when you hear him again he will be grunting at a safe distance.

A curious fact about the bull moose at such moments of emotional excitement is that he readily answers a *call* and comes headlong to meet it. Almost everything will serve for an issue when the bull moose is in a receptive attitude. I have called him by imitating the bellow of his mate, by pounding on a stretched skin, by grunting or *chocking* in my throat like a rival bull, or by simply making a loud roar unlike anything on the earth below, or, I trust, in heaven above. Here again he serves admirably as an emblem of the new type of political leader, who stays in retirement until the people call him loudly to their service. Unfortunately, the summons to the bull moose is sometimes arranged by crafty men with guns, and when he rushes out

Copyright, Brown Bros.

THE BULL MOOSE

eagerly to meet the call he goes to his own destruction.

In many other ways the bull moose shows symptoms of emotional fits and of a disordered intellect. As T. Roosevelt says (p. 229), "he frequently shows a clumsy slowness of apprehension which amounts to downright stupidity." The leader who adopts the bull moose as his emblem, therefore, should be wary of talking too much, knowing that words are remembered, or of writing confidential letters that are almost certain to be purchased by the newspapers —those vile and slanderous instruments of the corrupt interests, without conscience or any appreciation of true greatness.

Another noticeable characteristic of the bull moose is his inordinate and unchangeable selfishness. Whether roaming the woods in solitude, or tearing up the earth, or coming headlong to the call, he is thinking, first, last and all the time of the safety of his own skin and the fullness of his own stomach. I can take off my hat to a cow moose, having frequently seen her sacrifice herself to save her offspring or to protect the herd in the winter yard; but I never yet saw a bull moose do a thing for anybody but himself. He is the incarnation of self-interest. A cow or even a calf moose, if she sees danger approaching, will warn all others before she takes the first step for her own safety; but a bull moose will sneak away silently at the first sniff of peril, leaving all others to look out for themselves. And that, by the way, is the real reason why a female animal is invariably found at the head of a band of moose of of deer of any kind. If they are approaching danger, you will invariably find the cows ahead, the calves

close behind, while far in the rear comes the bull, taking care not to expose his precious hide and running from a safe distance at the first warning of danger. This characteristic of the noble totem, however, need not be emphasized—unless, perchance, the new party goes over bodily to the suffragets.

Further indications of the bull's essential selfishness are found in his frequent abuse and browbeating of all other moose that are smaller than himself. He cannot tolerate a rival, but flies into a jealous rage at the first suggestion that there is any other bull moose in the universe. His voice at such times is a squeaking grunt, ridiculously small for so great an animal, which sounds like *ungwuh! ungwuh!* Herein we have a suggestion of those ferocious warriors described in Parkman's "Conspiracy of Pontiac," who always began a speech by shouting "Ongwehonwe!" which in the tongue of that tribe means, "I am the only man; all others are squaws or liars."

At all times the bull moose is easily fascinated by too bright a light. Occasionally when I am studying the animals at night, with a jack in the bow of my canoe, I run across his lordship filling himself with lush lily roots. Most animals will stare at the jack for a time, and then turn away into the woods. Enough limelight is as good as a feast for a sensible creature. Now and then, however, I meet a bull moose that stares too long at the light, much as a politician might look too much upon glory, and he ends by floundering headlong toward the thing that dazzles him. At such times he is dangerous. In his blind infatuation he sees nothing but the bright object of his desire, and he clumsily knocks down everything in his path as he jumps toward it. Once I was upset in this way by a fool moose that tumbled over my canoe and that floundered madly when the jack was extinguished, hitting out aimlessly with hoofs and antlers. The only sure cure for such a bull is darkness, oblivion. When you meet him, close your jack, or turn it on another candidate. Any bull moose will sober off quickly if left in the friendly darkness.

In the monumental work to which I have referred, the esteemed author says (pp. 216-217) that young moose are easily tamed, "and are very playful, delighting to gallop to and fro, kicking, striking, butting and making grotesque faces." Later, he says, they become a menace, and he tells the following story:

> "Some lumbermen once captured a young moose and shut him in a pen of logs. A few days later they captured another somewhat smaller and put it in the same pen, thinking the first would be grateful for a companion. But if it was it dissembled its feelings, for it presently fell upon the unfortunate newcomer and killed it before it could be rescued."

The bull moose emblem seems especially significant in view of this record. In a new party devoted wholly to the public good, there can be little personal glory, hardly enough for two and certainly not "enough to go round." It is meet and right, therefore, that the chosen leader should attack a rival and despoil him of his political goods. In a cold season I have repeatedly found where a big bull came upon a smaller moose in a bed that he had warmed with his own body and life blood, and the big bull drove out the little one and took the warm bed for himself. Following this excellent example, there was a righteous statesman, long ago, who found a plausible Democrat with a few patent uplift medicines which appealed to the suffering multitude; and he loudly denounced the poor Democrat as a demagog and a son of Belial, even while he stole his referendum and recall. Later this same hero found a nice little party of progressives with a chance at the next election, and waiting till the leader fell sick, he prodded him off and ran away with his band of followers, precisely as a big bull moose will drive away a little bull and take his chosen mates for himself. Here, then, is an emblem worth having, if the new party can only find the right sort of uplifter to wear it on his banner of victory.

Our renowned authority is in error, however, when he speaks here and elsewhere (p. 220) of moose "galloping" away when alarmed. I will not say that a moose never galloped; I only declare firmly that the man who saw him gallop was not sober. The bull moose often *bolts*, as he has a strong tendency in that direction, but he cannot gallop, being too

clumsily built for the business. When alarmed, he turns stiffly and lunges blindly away at an awkward trot, running into obstacles, knocking down dead stubs, smashing the underbrush, splashing and floundering thru muddy bogs, getting more and more excited at the pother he is making—precisely as an excited candidate might start a bolt and an indecent rumpus at an orderly convention.

The close parallel between your bull moose and your true politician may be carried further. Thus, the addlepated creature often lets himself be hunted by cunning destroyers that he might easily escape. Witness this scene (p. 209), where T. Roosevelt describes himself as creeping thru a thicket after a young bull moose that he has seen to lie down for his midday rest, chewing his cud in fancied security.

"My veins were thrilling and my heart beating with that eager, fierce excitement—which is one of the keenest and strongest pleasures which make up the wild joy of living—drawing a bead against his black side I pressed the trigger—the light blood sprang from both his nostrils,"—

and more of the same bluggy and butchery details which go to make up joy and heroism.

Look on that picture then on this, if you would know how true to political nature is the bull moose emblem. In a thicket of trickery and concealment an ambitious politician rests in false security, meditating on the public good and all the glory and honor thereof. Creeping up on his trail comes Boss Barnes, his jaw set, a cold gleam in his eye, and his gun loaded for bull moose. "His veins are thrilling, his heart beating with that eager, fierce excitement" which comes to those other appointed of the Lord, who battle at Armageddon and who know the real "wild joy of political living."

There are many other reasons why the bull moose is the true symbol of political righteousness. Note that he always makes a crooked trail, wandering about as if lost in the woods. Tho he travels a great deal he never makes any real progress, but always swings around to a point not far from where he searted. You shall never find him at the end of a straight course, and he is never where you would honestly expect him to be. He is cunningly hidden, away off to one side of his own tortuous trail, and watching his own back track. As T. Roosevelt says (p. 205):

"he has a very provoking habit of making a half or three-quarter circle before lying down and then crouching with his head so turned that he can surely perceive any pursuer who may follow his trail."

Ponder also the deep emblematic significance of this fact: every bull moose carries his own *bell*. This is the name given by hunters to the long gland that hangs from the animal's throat. No one knows what purpose this moose bell serves, but it is filled with nerves and is supposed by some to aid the animal's hearing, by catching vibrations too faint for ordinary ears. By others it is supposed to give added weight and *timbre* to the ridiculous little grunt of the bull moose. In a political sense this bell signifies that the leader is in the habit of keeping his ear to the ground, or else that he is always ready to sound the tocsin and to ring his own praises. There was a politician in Alexandria, in the fourth century if I remember correctly, who was inordinately fond of public attention, which he secured by noisy demonstration, by sounding his own praises and by constantly rousing the city over its threatened perils; and the Church fathers all called him *cymbalum mundi*, the bell-clapper of the universe. If the new party could by searching find such a leader, the bell of the bull moose would be the most significant part of the whole totem.

In appearance the bull moose is an awkward and most ungainly brute, a relic of some earlier and more barbarous age, when strange marsh beasts wandered up and down the earth, meeting wild and hairy men. As our esteemed authority says (p. 213), he is "strange and uncouth in look as some monster surviving over from the Pliocene." Among modern, more highly developed animals and men he is wholly out of place. He never learns wisdom, but comes to the same false calls and follows the old, primordial trails. Recently some moose were turned loose in the Adirondacks, only to vanish, and one who watched them found they had turned away from excellent food and a

good climate to follow the old forgotten moose paths northward to greater wildness and more primeval savagery. And when you think of it seriously, the professional politician, who lives all his life on the public domain, agitating, destroying, but never creating or doing any constructive work, is also a relic and a survival of barbarism. He seldom learns, but makes the same old holy professions and follows the same unholy practices that his tribe made and followed in the Stone Age. He noisily proclaims his virtue when it serves his purpose with the crowd, but he is very still and secretive when he is about his own affairs with the heelers and bosses. As our authority writes once more (p. 205): "It is astonishing how quietly a moose can steal thru the woods if it wishes." It is also a matter of wonder how quiet even our loudest politician can be when he dickers with "practical men" or with the wicked trusts over his campaign contributions.

On the whole, the bull moose is a "bully" symbol. I know of only one better, and that was suggested by the parade of Barnum & Bailey which has just passed my door. On a big wagon, resplendent with gilt, glass and general sham, and capped by a clown blowing a trumpet, is written in huge letters, "Blood-Sweating Behemoth of Holy Writ! Largest in Captivity!!" If the wicked Democrats could only capture that creature for a totem, the new party of the bull moose would find it hard to win the barbarian vote at the election.

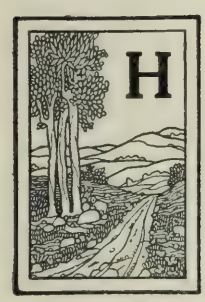
STAMFORD, CONN.

The Day's Work

BY I. G. MILLS

SUN's up!
See the flowers, smiling in the sun:
Sunshine streaming everywhere,
The day's work begun.
Keep a moving!
Keep a singing!
All day long,
Busy! Busy!

Keep a moving, be you old or young;
Every step a symphony;
Every thought a song.
Keep a moving!
Keep a singing!
All day long,
Happy! Happy!



Work is ended, finish with a smile;
Say a prayer and sing a hymn,
Then rest awhile.
Day is over,
Work well done:
Rest until to-morrow's sun.

BLOOMINGTON, ILL.

Views Awheel in England

BY JAMES A. B. SCHERER

President of the Throop Polytechnic Institute.

HAD Bayard Taylor only owned a bicycle, he would not have called his charming traveler's sketchbook "Views Afoot." England, and Shakespeare's England especially, is one of the choicest spots on the globe for those faithful few who still prefer, for one reason or another, the bicycle to the motor car. Our British cousins have never relinquished that ingenious device which, if you attach the pedals to the feet of a man, multiplies his pedestrian powers a hundred fold, and his pleasures—if he be a red-blooded man—immeasurably. And they have the roads for it everywhere—roads descended from Paradise! The consequence is that the British bicycle has advanced by constant improvement to a degree of perfection far surpassing our laggard production, and the "old timer" who desires once more to enjoy the full delights of "the wheel," as it used to be lovingly called, must now cross the water to England. He can do no better than supply himself there with a touring map of the country and a copy of Mr. Carnegie's chatty and companionable handbook, "An American Four-in-hand in Britain." This itinerary, from Brighton to Inverness, cannot be improved upon, and the comments of the alert and versatile millionaire are delightful. In Shakespeare's country one finds the richest beauty of England, and anywhere on the road he is sure of genial companionship.

The Briton abroad and the Briton at home are two utterly diverse concoctions. Meet him outside of his "right little, tight little island" and he is likely to prove himself a bear; meet him upon his truly native heath and he is an angel of ready good fellowship. That, at least, was my own unfailing experience. I suspect the truth of the matter to be that he is usually uncomfortable when away from home, and self-conscious because he is uncomfortable, and arrogant to hide his uncomfortable self-consciousness, and therefore disagreeable. He is even liable to lose his good nature when shut up in one of his shrill little express trains, enduring a provincial change of air; but meet him when he is really in his own neighborhood, climbing his native hills on a neighborly bicycle, and you find him the paragon of bipeds.

The proper treatment for an Englishman in a secluded railway compartment is a dose of indifferent silence. When you enter the cozy, upholstered cubby-hole with its single monopolist occupant, he treats it as an impudent invasion of his rights. The national motto, *"Dieu et mon droit!"* is written large on his countenance. His arms reach forth for his possessions in the manner of an irritated hen gathering her own to her bosom. Then he crackles out his huge morning paper into a screen between him and you, until the only extant signs of humanity are a pair of indignant legs (terminating always in "spats"), two eloquently red nervous hands, and three or four stiff upright hairs that obtrude above the edge of the paper screen for all the world like sentinel antennæ to observe the movements of the enemy. But you become unaware of his presence and look just as haughty as you dare. Presently the huge paper rustles, and he steals a swift glance at you as he creases back the seam down the middle. Play your part with sufficient indifference, and when you look again at the top of the screen the antennæ have lost some of their stiffness, the lubberly hands are less red, and the muscles of the legs have slowly begun to relax. By degrees the screen is gently lowered, so that the head protrudes into vision like a crustacean emerging from its shell. Continue your dignified indifference sufficiently, and presently your Englishman will talk. It is worth going all the way to England just to hear an Englishman talk—you cannot guess the amazing possibilities of

the language until you hear it as they sometimes mangle it in England. But venture the slightest show of interest, and the head draws—pish!—into its shell, to obtrude again only when angered. That is what happened to McClintock.

McClintock, my traveling mate, is such a sociable genius that he actually broke thru the ice with the Sioux Indians and got into the current of their thought as no other man ever has done. But McClintock had never been to England. One day when shut up with an Englishman in a second-class railway compartment he suddenly learned his limitations.

Now, McClintock's great-grandfather was an Irishman; and this was the cause of his downfall. Acquainted tho he was with the virtue of the famous silent treatment, heredity and Celtic temperament got away with this young Sioux Indian as they whisked thru a fresh rural district and he perceived thru the dusty car window the first familiar vegetables of all his homesick English experience. These happened to be of that peculiarly ancestral species that appeal to his deepest emotions. Before he knew it, therefore, he exclaimed, with youthful enthusiasm:

"By George! but there's a field of Irish potatoes!"

The screen came down with a crumpled crash, and the outraged Englishman exploded.

"Br-r-r-rh" McClintock says he said; he cannot recollect the vowels.

"Hirish potatoes, indeed! They are Henglish potatoes, bah Jove! Br-r-r-r-rh!"—and he rumbled away in the distance like an outraged Jovian thunderbolt, while McClintock shrank back in his corner and wished for the sociable Sioux.

But the average English traveler, with all of his insular reserve, is a thing, if not of beauty, yet of a very deep and satisfying joy, when compared with that type of the American traveler whom—or which—one meets all too frequently at large, and abroad. He is, of course, always Mr. Newly Rich, and he is never afflicted with reserve. There are so many Messrs. Newly Rich among us that we export them in cargoes to Europe, and Europe receives the impression that these people are "typical Americans." I have never seen a typical American to know him, but I do know that he is not the gay and strident zebra who capers in herds thru Europe every summer, cracking the air with his clangor and shaming the sun with the peculiar variety of his polish, until Europe is willing to pay any price to be delivered from "Americanismus," except her highly cherished heirloom, the apron of Danaë. If the "Almighty Dollar" is omnipotent here—as I do not for one moment believe—it is no less omnipotent there.

But, as I have heard more than one Englishman say, while the great American "blaggard," as they call him, is perhaps the chief of the species, the true American gentleman whom one may find all over the world—if one looks for him—is easily the peer of his kind. The bother of the blackguard is this—that you never have to look for him. He is so obtrusively and glaringly conspicuous that he throws the other man into the shade, who is perfectly willing to stay there, until sundown. So Europe gets her judgment of Americans; but we ought to stand it, if she can, and go back to our bicycles.

The forty miles between Oxford and Stratford is unbroken delight. Even the rain doesn't matter. For a couple of shillings you purchase an ingenious bicycle cape that protects not only yourself to perfection, but also the running gear of your wheel. The roads are so perfectly made that mud is a thing unknown; you only get a continuous musical "swish-sh-sh" from the play of your tires on the slippery surface that adds zest to the tang of the needles of rain pricking ceaselessly into your face. You seem fairly to fly thru the mist and the scud, the hedgerows trooping by on either side, until, before you know it, you reach the summit of a long gentle hill, and go coasting with the wind to the lowland, with its stretch of brimming green meadows. Then the sun bursts from behind the fickle clouds, and you see the golden England of your dreams: a silver stream level with its tufted margin of marigolds, dotted here and there

with bunchy willows; the sheep and fat cattle grazing among buttercups and daisies; overhead, the fleecy clouds scurrying like freshly washed lambs; and all about you that indefinable charm of ancestral atmosphere that makes you feel as if you had truly come home.

Presently you fall in with a real English gentleman scudding toward Banbury with you. The free masonry of the bicycle, and the fact that he is literally on his native heath, puts you at one with him instantly. He is interested in you, too, as you can see by his perfectly well-bred observance. He detects your Yankee origin in your first careful sentence, and quietly but without the slightest tinge of superiority or patronage proceeds to investigate this *rara avis Americana*. Or, as I heard a charming London girl neatly phrase it:

"Oh, yes, we like to have you come over, don't you know, so as to show you off to our friends as a new kind of a beast."

She didn't mean the least thing unpleasant by that; it is only an idiosyncrasy of British dialect. I know an English woman of irreproachable refinement who does not hesitate to remark: "It's perfectly rotten, don't you know?"

And their facility in circumlocution is equally startling. In a meadow on the banks of the Thames, where we had celebrated the sacred rite of afternoon tea, I heard an Oxfordshire girl say to her brother:

"I think we had better be going. Do you know, it's rather somewhat after five-and-twenty minutes to six?"

Surreptitiously observing my watch in order to get the translation, I found it was twenty-three minutes to six.

Well, you ride on with your English companion thru the rain-filtered sunshine, and presently, as you whisk downhill and across the open square of a long, straggling town, he points to a tapering Gothic monument and shouts:

"That's Banbury Cross!"

Whereupon, a flash of psychological foolery! Before I could mentally classify Banbury Cross I was just a kilted baby again, standing at a gentle mother's knee. In amazement I said to my companion:

"Will you please tell me what magic this monument possesses, that it brings back lost visions of childhood?"

But before the question was half out of my lips, Mother's song, of course, came floating back to me thru the mists of vanished years—

"Ride a cock-horse to Banbury Cross,
To see an old woman ride on a white horse;
With rings on her fingers and bells on her toes,
She shall have music wherever she goes."

That is the chief of all the charms of England, if you take to your England as I did. You go riding your new-fangled cock-horse hither and thither, harum-scarum, everywhere, and, like the old woman at Banbury Cross, you find music wherever you go, as some unexpected mossy ruin by the roadside suddenly materializes the fabric of your dreams. We Americans drink in English folk-lore and legend and history with the milk of our mothers; it is a delight unlike any other in the world to go back to the old mother country, and find that your fairyland is true. Nothing has renewed me since boyhood as these swift, sunny glimpses of England.

By all means spin over to Warwick! It is only 7 miles up the Avon from Stratford, thru a hoary druidical wood. At last you climb the rocky eminence on which this clustering, clambering town is snugly nestled, and find yourself upon soil that was broken for building in the very year that our Savior was born! We Americans are likely to fancy that if you give a village time enough to grow, it is sure to become a city by and by. But look at Wantage, crowning the hills near old Oxford; a village when Alfred was born there, and a village to this very hour. Warwick, you feel, comes also unchanged from the past, as you glide thru its ancient arched gateway; but when a little later you gaze awestruck up at Cæsar's Tower, it is not that the past comes to you, but rather that you seem to grow suddenly old, and to live before Shakespeare was dreamed of.

Pasadena, Cal.

Literature

The Religion of Ancient Rome

THE results of the increasing study of comparative religion and religious psychology have produced a growing feeling among thoughtful people that all religions are somehow related and each can be better understood in the light of the others. This attitude, together with the recognition of the importance of the religious factor in determining the course of history, has aroused a deep interest in discovering and interpreting the facts of various religions which once seemed of little or no significance. In no field of religious history have greater revelations come in recent years than in that which concerns the Græco-Roman influences in the development of early Christianity, and the contribution of Rome herself, altho formerly considered a negligible quantity, is now receiving due recognition. The struggle which the new religion made for mastery in the Roman Empire and the conditions and ideas which favored its reception, while they modified its form and content, are coming more clearly into view thru the efforts of the excavator, the archeologist and the historian. Among those who are piecing together the ancient bits of evidence for the religious life of the empire and the centuries that preceded Augustus, we count as one of the most successful and efficient Prof. J. B. Carter, the director of the American School of Classical Studies in Rome, whose Lowell Institute lectures have been somewhat recast and published in a most delightful and stimulating volume on *The Religious Life of Ancient Rome*.[1] Professor Carter finds in the long and unbroken religious history of the inhabitants of the seven hills a continuous development and enrichment wrought by the centuries of change and absorbing contact with the various peoples of the world. He begins his fascinating story with some account of the religious ideas of that primitive folk whose suspected presence was first certified by the discovery, just ten years ago, of an ancient necropolis under the very center of the old Roman Forum; and he gives vivid pictures of the transforming influences and their results down to the era of Gregory the Great. Thru all the revolutionary changes of this millennium and a half, Professor Carter traces a kind of unifying principle, born of natural conditions, persisting under a great variety of forms, and reacting upon the almost overwhelming waves of foreign influence. This, he believes, is sufficient to guarantee to Rome, from the religious point of view, the right to her title, "Eternal City." Especially attractive are the author's chapters on "Rome and Greece" and "The Religion of the Early Empire," wherein he discusses the decay of the early faith, the introduction of new cults from the East and the struggle between the religions of Mithra and Christ.

Prof. Warde Fowler, in his Gifford lectures, chose a narrower field than that of Professor Carter, and he describes in more detail the rites, ceremonies, customs and regulations thru which *The Religious Experience of the Roman People*[2] found expression from the earliest times to the age of Augustus. From these facts in worship he seeks to arrive at the inner spirit and motive of the religious experience. In spite of the paucity of materials and the difficulty of properly estimating the testimony in hand, Professor Fowler has laid down a broad outline of the subject and filled into it the most thoro and valuable studies to be found in English, and his book will remain a standard work for years to come. On mooted questions he speaks with all the conservatism of the true scholar, but his

[1] THE RELIGIOUS LIFE OF ANCIENT ROME: A Study in the Development of Religious Consciousness from the Foundation of the City until the Death of Gregory the Great. *By Jesse Benedict Carter.* Boston and New York: Houghton Mifflin Company. $2.

[2] THE RELIGIOUS EXPERIENCE OF THE ROMAN PEOPLE. From the Earliest Times to the Age of Augustus. *By W. Warde Fowler, M.A.* New York: The Macmillan Company. $4.

mind is open to any theory which the evidence warrants. He holds to the view that the Lares were not originally household gods, but divinities presiding over the land allotments and were brought into the house thru the mediation of the family slaves. Only tentatively does the author give his allegiance to the theory that the "religion of Numa" was that of an invading race engrafted onto and nearly effacing the more primitive forms, but he finds evidence of this in the Lemuria festival, which he regards as a survival from the older race that once occupied the site of the later city-state.

Both of these volumes, besides throwing valuable sidelights upon the constituent elements of Christian thought and worship, show how intimate was the relation between religion and the everyday life of the people of Rome. The best approach to the family and social life of the unnumbered millions of the great empire of the Cæsars, wherein were resident the forces that have saved and transmitted the ancient civilizations is thru the door of Rome's religious experience.

Our Domesticated Disease Carrier. The House Fly, Disease Carrier. By L. O. Howard, Ph. D., Chief of the United States Bureau of Entomology. New York: Frederick A. Stokes Co. $1.60.

After having wasted a good deal of sympathy on the house fly and perhaps even more of condemnation on the spider, we have now come to reverse our opinions with regard to them, and we know that the fly is probably one of the worst enemies that the human race has, while the spider is and always was and will be if allowed to be, a precious benefactor. Those who want to know the reasons for that change of opinion will find them in Dr. Howard's book. At the end of the introduction he says: "It is not intended to be a scientific monograph; it is simply an attempt to tell in an understandable way what is known about the subjects indicated in the title." Only during the past two years has the crusade against the fly been properly taken up. It is a little bit difficult now to understand why it has been so long delayed. Here, for instance, is a list of places where flies breed, made some years ago: Kitchen slops and offal, 193; carrion in streets, 267; sawdust sweepings from slaughter house, 110; rotten chicken feathers, 258; human excrement, 196; cow dung, 997; rotten watermelon and muskmelon, 14. The list might be extended, but we prefer not to. Those who may be inclined to think that recent measures against the fly are over-severe need only read Dr. Howard's book. Unfortunately, the brunt of the evil done by the fly falls most on very small children, and man of the fatal diseases of the summer time are due to the presence of the domestic fly.

Industrial Causes of Congestion of Population in New York City. By Edward E. Pratt, Ph. D. New York: Longmans, Green & Co. $2.

Seldom is a thesis for a university degree so valuable as this admirable investigation which comes from Columbia. Congestion of population has become a catchword in recent years, an excuse for every nostrum which any reformer proposes to administer to society. Dr. Pratt distinguishes between congestion of population, which is "the undue congregation of business or population on a limited area of land," from overcrowding, which is "the excessive, intensive utilization of buildings," and describes the actual living conditions of the inhabitants of any given congested area. Of the proposed cures for congestion, he finds, from careful inquiry into the facts, that most would be ineffective. Tho in New York City additional means of rapid transit are sorely needed, "they form a partial and incomplete solution for the problem of bad living conditions." While the restriction of immigration might relieve the worst crowding, it "is not apparent that it would prove a vital, far-reaching remedy for congestion." A shorter working day is not a fundamental solution; and the minimum wage has little bearing on the question. Tenement manufacture "is not an important cause of congestion." Removal of the slum population to farm colonies is impracticable and quixotic. It is doubtful whether the education of the people will accomplish much in this connection. Good, substantial houses, to

be let at low rents, built in large numbers in the suburbs, "would immeasurably improve the living conditions of large numbers"; but the most efficient remedy would be the removal of factories from the inner city, and their distribution, according to some comprehensive plan, thruout the outlying suburbs, together with the enactment of laws to prevent the reproduction of bad living and housing conditions in the other neighborhoods. This is city planning.

At Good Old Siwash. By George Fitch. Boston: Little, Brown & Co. $1.25.

Yale, Harvard and Princeton have provided volumes of good stories, but the undergraduate of the Middle West has not yet come to its own in the field of fiction. *Good Old Siwash* comes the nearest to doing the subject justice. Grotesque caricature it is, yet somehow true to life; satirical burlesque, yet at the same time kindly and genuine in its feeling; to accomplish such a combination as that is in itself to catch the college spirit. They are just the sort of stories that a college man would like to tell if he could command such a rich vocabulary of hyperbolical slang. We know all the people he tells about, those of us who have been fortunate to live inside of such a college. We know Ole Skjarsen, who was the greatest man who ever came to Siwash, but didn't make a frat.

"He didn't for the same reason that a rhinoceros doesn't get invited to garden parties. Not only his clothes but also his haircuts were hand-me-downs. His language was a sort of head-on collision between Norwegian and English in which very few words had come out undamaged. In social conversation he was out of bounds nine minutes out of ten, and it kept three men busy changing the subject when he was in full swing. He could dodge eleven men and a referee on the football field without trying, but put him in a forty by fifty room with one vase in it, and he couldn't dodge to save his life."

We also recognize at sight James, "the champion featherweight fusser"; Birdie Andrews, who wrote sonnets for the Lit.; Franklin, the snob; the Alfalfa Delts; the Eta Bita Pies, and Mary Jane Hicks, the little red-headed girl from Missouri who marshalled the Browning Hall vote and smashed the slates at all elections. Coeducational colleges, like good old Siwash, certainly have the advantage when it comes to the excitement of uncertainty due to the presence of the incalculable element. "Of course, I don't think a man should go to college to find a wife; but if his foot should slip, and he should marry a girl whose sofa pillows have the same reading matter on them as his, there's nothing to yell for help about."

Sport in Vancouver and Newfoundland. By Sir John Rogers, K. C. M. G., D. S. O., F. R. G. S. New York: E. P. Dutton & Co. $2.50.

From Egypt to Vancouver is a decided change, but that is what probably attracted Sir John Rogers, a resident of Egypt, in planning his vacation. Some authors begin their narrative with their arrival on the scene of activity, but in the present case the reader is entertained by an account of the trip from the tropical heat of Egypt to the evergreen forests of Canada. Sir John Rogers had won the title of Pasha, when serving in the Egyptian army, and this fact caused a horde of American newspaper correspondents to attempt—unsuccessfully—to interview him on his arrival in New York. An Englishman's observations on transcontinental travel are interesting. Among other things he recommends the traveler to carry his own whisky bottle, as he finds the price of drinks on the train high. The text of the book is written from a diary kept by Sir John Rogers on two autumn holidays in Vancouver Island and Newfoundland. It is profusely illustrated from good photographs and sketch maps. The numerous pictures of long strings of fish hanging from birch bark crosspoles indicate that the author had good luck with his hook, and several photographs of canoes, with antlers strapped on top of the luggage, seem to testify to his skill with the rifle. One illustration is of a caribou, with thirty-four points, shot by the author. The book will be found an entertaining story of adventure and sport.

Literary Notes

....A passionate pilgrim—but a good Catholic, not a perfervid lover—writes of Ars-en-Dombes, Saint-Jacques de Compostella, and Mont St. Michel in the book which he entitles *Trois Villes Saintes*. The last of these

monasteries is the only one well known to American tourists, which is, perhaps, a good reason for reading M. Emile Baumann. The traveler takes his voyages very seriously (Paris: B. Grasset; 3 fr. 50.)

....The Right Reverend Charles F. D'Arcy, Bishop of Down, has written some vigorous and well reasoned chapters in his small volume on *Christian Ethics and Modern Thought* (Longmans; 40 cents). It makes stimulating reading.

....The Rev. James W. Lee writes a goodly sized volume to show that Christianity is *The Religion of Science* (Revell; $1.50) and so must be the faith of the coming man. The arguments are often fresh and original if not strictly scientific and the style makes the book readable.

....There has been formed at London a "Blake Society," the principal object of which is to bring together the admirers of William Blake, the poet-painter. The secretary of the new organization announces that meetings will be held in London, at Chichester, and at Felthan.

....The Harpers have issued a new edition of *Great Religions of the World* ($2), which was written by such specialists as Prof. Rhys Davids and E. Denison Ross, and first published about a dozen years ago. It contains useful and reliable sketches of the most important world religions.

....*The Students' Hymnal* (Ginn; 50 cents), edited by Dr. Charles H. Levermore, is well designed in form and contents for school use. The hymns and tunes are wisely selected from those that have proved of abiding value and give worthy expression to sincere religious aspiration.

....Available facts and figures regarding the declining birthrate in various countries and the causes thereof, together with the conditions and evils which result in uncalled-for infant mortality, are given with plainness and discussed vigorously by M. S. Iseman, M. D., in his timely volume on *Race Suicide* (Cosmopolitan Press; $1.50).

....William Millet Collier, during four years American Minister to Spain, publishes thru A. C. McClurg & Co. an attractive and generously illustrated volume of 330 pages, *At the Court of His Catholic Majesty* ($2). The book has that attraction for readers which belongs to their own foreign travels, while the author's official post has given him, besides, unusual opportunities for observation and understanding.

....Rev. Edward E. Keedy's *Moral Leadership and the Ministry* (Worth; $1.25) contains a stirring appeal for greater heroism on the part of ministers in the exercise of their high function of making known the will of God in matters of moral import. Mr. Keedy lays much emphasis on more thoro equipment as a basis for the minister's more vigorous leadership.

....An attractive little volume comes to us from the Houghton Mifflin Co. in Eugene R. Musgrove's anthology, *The White Hills in Poetry* (pp. 397, $1.75). The New England poets have not overlooked the New Hampshire mountains as a subject of verse, nor has Mr. Musgrove overlooked any of their verse. Tourists may be expected to make use of this illustrated volume as a poetical guide book. Dr. Samuel M. Crothers contributes a short introduction.

....A volume composed of forty-eight stories by nearly half as many authors, translated into English by Helena Frank, bears the title *Yiddish Tales* (Philadelphia: Jewish Publication Society; $1.25). These tales, chiefly of the Russian Ghetto, are not devoid of humor, despite the incessant plaintive note of Judaism, and one familiar with the types represented need only gesticulate to complete the illusion; for the translation is literal. Biographical notes give particulars of all the authors included, and the glossary is helpful.

....Among the many stories of the "Titanic" disaster given by the survivors we have seen none more full, clear and restrained than that of Mr. Lawrence Beesley, who has done well to put into permanent form his narrative of *The Loss of the SS. 'Titanic'* (Houghton; $1.20). Mr. Beesley draws not only from his own experiences and impressions, but also from the accounts given him by others, making a vivid picture of the ship's sinking, the work of rescue, and contributing valuable suggestions for future security.

....*A Chinese Appeal to Christendom Concerning Christian Missions* (Putnam's; $1.50), by Lin Shao-Yang, is largely a criticism of orthodox Christian beliefs and missionary methods which prevailed a generation ago. The author makes the failures, inconsistencies and mistakes of Christian propagandists the basis of his indictment of missionary effort, and holds up to the western world a very unattractive but quite accurate picture of its own confusion of beliefs and struggle for a universal faith. Until order and unanimity prevail at home he would counsel caution in going abroad. The book recalls G. Lowes Dickinson's "Letters of a Chinese Official," but lacks the literary charm

and power of that essay. Neither its facts nor its insinuations will change the attitude of any who know the real spirit and positive results of modern missionary work.

....The great work done by J. Hudson Taylor in the founding and development of the China Inland Mission would insure interest in any adequate account of his career. But beyond this interest the first volume of his complete biography entitled *Hudson Taylor in Early Years* (Doran; $2.25), by Dr. and Mrs. Howard Taylor, is an attractive, almost romantic story in itself, and is correctly described in the sub-title as "the growth of a soul." His ancestry, early training, years of uncertainty and initial efforts in China culminating with his first successes in missionary work are the subjects sympathetically treated as preparatory to his larger labors—to be set forth in the promised volume covering his mature life.

....Edward Legge's *Comedy and Tragedy of the Second Empire* is dedicated to "the eminent statesman and historian of *l'Empire libéral*," Emile Ollivier: who was Prime Minister in 1870, and is now the oldest member of the French Academy, being in his eighty-seventh year. The present volume's subtitle is: "Paris Society in the Sixties, Including Letters of Napoleon III, M. Pietri and Comte de la Chapelle, and Portraits of the Period." The work is decidedly friendly to the Emperor and to his régime. The chapter on Prince Victor Napoleon, the modern head of the imperial house, is not the least interesting here. Prince Napoleon's political faith is moderate indeed: "If I am not with the extreme Left I am still less with the Right," he declares. Perhaps, however, he is too wise a philosopher to make a persuasive pretender. (Scribner; $2.)

....The *Second Supplement* to the *Dictionary of National Biography* (Macmillan; $4.50) forms a record of the losses sustained by the British Empire between 1901 and 1912 thru death in the ranks of those who have contributed in conspicuous ways to the public welfare. The first of the three volumes to be issued covers the names from Edwin A. Abbey, the American-born painter, to Edward J. Eyre, the English-born governor of Jamaica. In the long list we find such literary men as Sir Walter Besant and John Churton Collins, among scholars Edward Caird, Evelyn Abbott and Lord Acton, among publicists and statesmen Sir Charles Dilke, Campbell-Bannerman and the Marquis of Salisbury. The longest and most important article, and one which has provoked controversy, is that written by the editor himself, Sir Sidney Lee, on the late King Edward VII.

Pebbles

"HAVE you any invisible hair pins?"
"Yes, madam."
"Can I see them, please?"—*The Delineator.*

"SAY, do you know how to make a triangle?"
"Sure; pull one side out of a square and glue the loose ends."—*New York American.*

"I UNDERSTAND the professor's wife has a little baby."
"Yes. Delightful, isn't it?"
"Boy or co-ed?"—*Judge.*

"ARE you perhaps sitting on my hat, sir?"
"Was it a stiff hat or a soft one?"
"A soft one."
"No, then it isn't yours."—*Meggendorfer Blaetter.*

CALLER (on the doorstep).—Is the lady of the house in?
Housemaid (who has just received a month's notice).—The mistress is in, but she's no lady.—*Pearson's Weekly.*

"How much Swiss cheese do you sell for twelve pfennig?"
"Fifty grams."
"And for fifteen pfennig?"
"Also fifty grams; but then I give a large hole besides."—*Fliegende Blaetter.*

"No, Willie," said his mother, "no more sweets tonight. Don't you know you can't sleep on a full stomach?"
"That's all right, mamma," said Willie. "I can sleep on my back, can't I?"—*Woman's Home Companion.*

"THIS isn't the first time you have come into contact with the police?" said the lawyer, sternly, to the witness.
"No, sir," was the reply.
"What, may I ask, was the result of your former encounter?"
"I awoke him. He had gone to sleep on his beat."—*Tid Bits.*

I NEVER have been in Hongkong
Nor touched New Zealand's shore;
I've never seen the crowds that throng
The streets of Singapore;
But once I had to check my trunk
To Manayunk.

I've never sailed Magellan's strait
Nor crossed Sahara's sands;
I've never knocked at Delhi's gate
Nor fared to Arctic lands;
But once I paused an hour or two
At Baraboo.

I've never crossed the Amazon
Nor stood beside the Nile,
And I have never gazed upon
A single Shetland Isle,
But once I stayed till after dark
At Yellville, Ark.

—*Chicago Record-Herald.*

The Independent

Entered at New York Post Office as Second Class Matter
Publisher, Clarence W. Bowen
130 Fulton Street - - - - New York

A WEEKLY MAGAZINE FOUNDED IN 1848
One Year, $3.00 Single Copies, 10 Cents

Single copies over six months old, 25 cents. Postage to any foreign country in the Universal Postal Union, $1.75 a year extra; to Canada, $1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as those offered by any responsible agency.

An order for the change of an address should be received two weeks before the change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of the publisher's price any book reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with $1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. Even so, we cannot hold ourselves responsible for their return. Authors should preserve copies of their manuscripts.

Advertising rates will be furnished on application.

THE semi-annual index of THE INDEPENDENT for the last six months is now ready. Subscribers may obtain a copy free of charge by sending us their request on a post card.

Our Position in This Campaign

COLONEL WATTERSON, editor of the Louisville *Courier-Journal,* says that in the case of the candidates being Taft, Roosevelt and the Devil, his journal would be obliged to support his Satanic Majesty, for it cannot take to the woods. That is the extreme position of partisanship. It is immoral, vicious and in rhetorical form impious. Colonel Watterson recalls the bitter words he has spoken against Governor Wilson, as cold, heartless, ungrateful and treacherous, and he does not withdraw a word of it; nevertheless he will support the ticket, for he must. Such slavery to party appears to us treachery to the truth. Much like it is the evil principle of Speaker Clark, who will do what he can for his successful rival, for, he boasts, he has never in his life scratched a Democratic ticket. That is not a record to boast of; it is rather one to be ashamed of.

We are in no such plight as is Colonel Watterson. We claim to be independent, and we do not hesitate to criticise any party, or to support any candidate whose character and whose principles seem right and of advantage to the people. We expect to grieve the honest supporters of other candidates and parties, but we shall dodge nothing and shall do what we can to secure the success of President Taft as against Wilson, Roosevelt or Debs.

The Democrats have made the best nomination possible. Their candidate is a scholar and a gentleman. He abused nobody during the campaign. He did not rush to the convention, like Roosevelt and Clark, to push his own fortunes. Woodrow Wilson has made an admirable Governor, and he is a forceful speaker, and he knows modern political history as few men know it. He is a writer of history, as is Mr. Roosevelt, if he has not had Roosevelt's wide experience in making history. He is a leader whom none of his party, and none of those who are attracted to him from any other party, need be ashamed to follow. And yet we shall follow the banner of William H. Taft.

This is not a question of advanced or progressive policy, for there is little difference between the two parties—or the three, if we are to have a Roosevelt party—in their political doctrines. So far as we can see, Mr. Taft is a better Progressive than Roosevelt, and has done more for the Progressive cause, if he has not vociferated so indefinitely. On the academic doctrine of taxation for revenue only, Governor Wilson stands alone of the candidates, but that is a blind, for the Democratic party has no idea of putting it into law, and both parties are at one in reducing the tariff, and Taft's fight for reciprocity with Canada was a brave effort for tariff reduction. On Monopoly and Privilege there is nothing to choose between the parties and candidates. The meaninglessness of platforms appears in the provision in the Democratic platform pledging its candidate to a single term of service, even if it be but four years, while the party nominated Grover Cleveland three times and elected him twice. No less absurd is the Demo-

cratic pronouncement in favor of promising independence to the Philippines. No Democratic Congress or President would consent to it.

Why, then, if there is so little difference between the two parties in their announced principles, and both candidates are excellent men, do we favor Mr. Taft as against Woodrow Wilson—for we do not yet know that there will be a third candidate in the person of Theodore Roosevelt?

For several reasons. One, a minor one, is that Mr. Taft is a tried and experienced executive, while Mr. Wilson is not. We are not afraid of a second term; indeed, we like it. Experience tells in official service. Mr. Taft's record of things done is fine, and his errors, barring one on the tariff in the first months of his term, have been in minor or personal matters. We would like to see him finish the Panama Canal. We can trust him in international matters, such as those in Cuba and Mexico, in which he has acted. Probably Governor Wilson would act wisely, and we should be much afraid of Mr. Roosevelt were such entanglements to appear again; but President Taft has been tried and not found wanting. These international matters are of the very first importance, even if they do not count for much in popular esteem.

But a more compelling reason for preferring excellent William H. Taft to excellent Woodrow Wilson is that the latter's party is persistently and notoriously false to the doctrine of the equal rights of man. In the States which it has controlled since the Civil War it has in legal and illegal ways denied and flouted popular sovereignty. It shamelessly manages to shut from the ballot a third of its citizens. For this it makes no apology, but rather defends it. It does this on the claim of white sovereignty as against popular sovereignty. It is a party of caste, a party of both tyranny and fraud. The Republican party is none too clean in this matter, for it is weary in well doing; but it has never in one single State excluded its citizens from the ballot by law or by constitutional provision devised for this confest purpose. In this we cannot and will not forgive Democracy till it shows signs of repentance.

The success of the Democratic party, with the election of its candidate for President, would put in power the party of aristocracy, the party that creates caste, the party that declares that it is not safe to trust the people, that says that colored men are not fit to vote, and excludes them from the ballot. We cannot support a party that is guilty of this greatest attack on the basal principles of democracy. The Republican States allow the poorest or the blackest man to vote. The Democratic States, in the order of their party strength, disfranchise cheerfully most of their colored citizens, and, incidentally, tens of thousands of their white citizens. There is no other injustice in this country equal to that. That is the reason that it is a rare negro, a white blackbird, that will vote the Democratic ticket. If Indiana or Illinois goes Republican it is done by the resentful negro vote. Let Democrats do justice to the negro and the race would divide just as white people do. It is not agreeable to tell these ugly truths, but it is necessary, and we should not shut our eyes.

The great duty of political organization is to do justice to all the citizens, to give a fair show, a square deal, to poor people, to colored people, to working people, white and black, to hold back the hands of predatory wealth and power, North and South, East and West, and open the door of opportunity to all. We believe in trusting the people, all of them, even if they may now and then go wrong. We believe in the direct primary and the other ways by which the rule is brought home directly to all the rulers, and the power of bosses, so often corrupt, is removed. Our position is that of the Progressive wing, which is more and more in control in both parties, but chiefly in the Republican party and the Republican States; but whose application the Democratic party and its powerful bosses limit to the financial interests of its white citizens.

Give us more progressiveness, more equality of privilege, more of the square deal for both white and black. Both parties talk the square deal for all white people, but one party denies it offensively, tyrannically, to black people, and that party we cannot support in a national

election, however freely we might support its candidates in a local campaign in some of our States.

The Baltimore Nominations

By insisting, in and out of Congress, upon its tariff revision plan, the Democratic party probably has retained a majority of those voters who came over to it in 1910. We said four weeks ago:

> "If it would attract independent voters in the so-called doubtful States, voters who have been classed as independents in recent national elections, as well as those Republicans who may be driven to independent action this year by the nominations at Chicago [which then had not been made], it must show wisdom in making its nominations at Baltimore. Extraordinary conditions in the opposing party, offering an unusual advantage, will not warrant unwise and careless action in the Democratic convention."

It must be admitted that the convention at Baltimore displayed much political wisdom when it nominated Wilson and Marshall. To some, this exhibition of sagacity was unexpected. It could not have been welcomed by Mr. Roosevelt, who, his son says, was "praying for Clark." The Speaker, if he had been nominated, would have been stronger than his party in no State; in several States he could not have won the full party vote. His candidacy would not have appealed to independents, or to dissatisfied Republicans, Progressive or otherwise. Mr. Underwood, as the party's nominee, would have been handicapped by his residence in the South. Moreover, he had won the hostility of Mr. Bryan and was regarded by many as a reactionary. His candidacy could make no appeal to Progressives. Mr. Bryan was also the bitter foe of Governor Harmon, and it was due largely to Mr. Bryan's public and persistent hostility that the Governor was classed—unjustly, as we believe—with the reactionaries and the representatives of Wall Street. His nomination, if it could have been brought about, would have driven many Democratic Progressives to Mr. Roosevelt's new party.

The political situation, as well as the merit of the man, required the nomination of Governor Wilson. His nomination was due to what may be called the "common sense" of the convention. It was procured by no bargain with bosses or powerful politicians. For it he is under no obligation to any one except himself, his loyal and honest personal friends and the assembled representatives of his party. Neither in the preliminary canvass nor in the convention did he excite the resentment of any rival. All who competed with him may cheerfully support him and promote his success at the polls. Wisdom was shown also in the nomination of Governor Marshall. He has much political strength in Indiana, which in the past has been one of the doubtful States.

The nomination of Governor Wilson has had a depressing effect upon Mr. Roosevelt's project for a new party. Immediately after the completion of the ticket at Baltimore, the number of deserters from the Roosevelt standard was largely increased. Charles J. Bonaparte, who was Attorney General in Mr. Roosevelt's Cabinet, and who intends to vote for the ex-President if the latter's name "is on the official ballot," said last Saturday:

> "It were futile to deny that the nomination of Governor Wilson has rendered the choice of Col. Roosevelt next November less probable, and his candidacy less obviously needful in the public interest than would have been the case if the same influences had triumphed at Baltimore which controlled the Chicago convention."

If Mr. Bonaparte cannot find a ballot with Mr. Roosevelt's name on it, he says, he will vote for Wilson. In Michigan, Governor Osborn opposes the new party project and adds that Progressives can vote for Wilson without bolting. In several other States the Roosevelt Progressives are frowning upon a new party, and some of them say they will vote for the Democratic candidate. There is now to be observed a general tendency in the Roosevelt Progressive ranks to work for reform in the old party and not outside of it. This tendency will not be checked by Mr. Roosevelt's recently proclaimed determination to make an issue out of the high cost of living. The Democrats took possession of that issue in 1910, so far as it relates to the tariff, and Mr. Roosevelt has to explain why, in the seven years of his service as President, he let

the tariff alone. We shall be surprised if his projected new party ever amounts to much.

The Democratic Platform

THE Baltimore platform is not such a wonderfully progressive and definitely positive platform as we were assured it would be. Mr. Bryan is satisfied with it, for he was on the committee that wrote it, indeed on the sub-committee, and was credited with taking a draft with him to the convention. But it is burdensomely long, and few will take the trouble to read it. It would have been more effective in a quarter of the space.

It begins with the old cry of the tariff. The tariff should be for revenue only. But it is not, and is not likely to be. Those who wrote the words do not believe in enacting a tariff that shall give no protection. But the present tariff is too high, and the demand for its reduction is right and popular. The platform tells us that "the Republican tariff is the principal cause of the unequal distribution of wealth"; and that "excessive prices result in large measure from the high tariff." Doubtless the high tariff has had some effect, but high prices are all over the civilized world, even in free-trade Great Britain; and the Rockefellers and Morgans and the majority of millionaires have got their wealth by oil, railroads, banking, and other businesses that do not depend on the tariff for their profits.

Next, the platform attacks monopolies and trusts, and asks for laws to control them. Here it is somewhat more specific than the Republican platform, because it mentions holding companies (already forbidden and dissolved), interlocking directorates and stock watering, and it condemns the Republican administration for not putting the officials of the Standard Oil Company and the Tobacco Trust in prison. Will the Democratic Administration do better?

Then comes an eloquent paragraph on State rights and Federal rights which talks bravely and says nothing. Then follows approval of the income tax amendment, and that for the popular election of Senators; but these are not distinctively partisan assets. It then asks for more publicity as to campaign expenses, even of the ownership of political journals, and the publication of the names of all those who endorse candidates for appointive offices. Corporations must be forbidden to contribute to a campaign fund, and individual contributions must be limited in amount. The Republican platform has similar provisions, but in fewer words.

The next point is one quite new in a platform. It directs the national committee, at the next following Presidential campaign, to have all delegates to the convention chosen by direct primaries, at which the voters shall indicate their choice for President. This may be a very good plan, and it may not. We are glad to have it tried by the Democrats, and we presume the Republicans will do the same in nearly every State. We should at least try it out.

Then follows a demand for efficient supervision by the Interstate Commerce Commission of railroads and other companies engaged in interstate commerce. It goes into details, such as the valuation of these corporations, at greater length than does the corresponding Republican statement, but the two mean the same thing. Which is the better depends on which will keep the promise better.

On the matter of rural credits by agricultural banks, the two platforms say the same thing, but on banking generally the Democratic platform positively condemns the Aldrich bill, and after the old Jackson manner denounces a central bank, but recommends nothing in its place. It condemns panics, which is safe, and it would have government funds deposited in banks competitively, a proposition which we leave to the experts.

Both platforms want a trustworthy judiciary, and the Republican platform objects to the recall of judges, while the Democratic does not want such injunctions as are unfair, a safe proposition. More notable is its declaration that labor unions must not be regarded as illegal organizations in restraint of trade, and that the Cabinet should have a Secretary of Labor.

On waterways, floods and conservation both parties had to announce some-

thing, but they could not manage to utter anything but the same generalities. It is so with agriculture, public health, parcels post, Alaska, the civil service and the merchant marine. These are not party questions; but the Baltimore platform demands that the Panama Canal put no toll on American ships engaged in coastwise trade.

There remains one subject on which the Democratic platform speaks positively—the Philippines. It repeats with much oratorical fervor the condemnation, uttered in three previous platforms, of the acquisition and possession of the Philippines, condemns it as an "experiment in imperialism" and "colonial exploitation," and at the same time as "an inexcusable blunder which has involved us in enormous expense," which has "laid our nation open to the charge of abandonment of the fundamental doctrine of self-government." It then asks that we immediately declare our purpose to recognize the independence of the islands, "as soon as a stable government can be established," and independence recognized by other nations. Inasmuch as the Philippine Islands are many and large, and only in a part of one island is free self-government yet possible, the Democratic pledge would wait long to be fulfilled. Meanwhile other nations think we are teaching self-government with perilous urgency. We do not think so. We observe that the platform carefully avoids saying the same things about Porto Rico.

Such is the platform. The rest of it is devoted to pointing with pride to the record of the Democratic House of Representatives during the last year, and the condemnation of the Republican party, and particularly the veto of the tariff bills. We are told that its pledges are not buncombe, but "are made to be kept when in office as well as relied upon during the campaign." In our view both platforms are buncombe so far as they talk generalities or approve policies on which all are agreed, or abuse the other party. They are for popular effect. They give us a flood of words, and would be more effective and seem more real if they were put in brief, sharp propositions that told us definitely what are the principles, if there are any, in which the two parties differ and to which they were pledged. More important than platforms are the history of the parties and the character and drift of the people who support them. Just now the parties find it difficult to discover partisan distinctions. In both parties are, as there should be, representatives of labor and capital, and both are seeking to solve the social and financial problems that concern us, and which are such as do not yet divide our great parties. It is the Socialists or the Prohibitionists that have something definite to say.

The Guardians of Liberty

This is a new organization, only a year old, a sort of semi-secret society like the Masons, which has officers of notable designations, and which already claims to have hundreds of thousands of members. The Rev. Augustus E. Barnett. D. D., is "Chief Recorder," Lieut.-Gen. Nelson A. Miles "Chief Attorney," Hon. Charles D. Harris "Chief Guardian," Rear Admiral G. W. Baird "Chief Vigilant," and Major-General D. E. Sickles "Chief Custodian." These constitute its National Court. It has a long string of National Counsellors, generals, clergymen, rabbis and officers of various orders.

The name of it indicates its purpose; but what is the danger to liberty which it will fight? Passing by the general statements in its constitution about the purpose to promote loyalty to the principles of our free government, we seem to find its more definite aim suggested in its "Declaration of Principles," in which we find the following paragraphs:

"It is our belief that every citizen should hold sacred his civil duties and responsibilities, and it is our desire and purpose that every office of the nation, State and municipality shall be held by men of ability, integrity and true patriotism. We hold that no citizen is a true patriot who owns superior temporal allegiance to any power above that of his obligation to the principles of the Constitution of the United States.

"As the fathers established, so are we resolved to maintain the complete separation of church and State.

"We deny the right of any political or ecclesiastical organization to manipulate or control the sovereign citizenship of our people, or to dispose of their rights and privileges for political office or power, and we are de-

termined that every citizen shall exercise his civil rights and privileges unmolested, answerable only to his conscience and to his God.

"We unite to protect and preserve the free institutions of our country, especially our public educational system, against any foreign or menacing influence and we particularly protest against the diversion of any public funds or lands to any religious purpose whatever."

It is perfectly clear that this organization is directed against what it regards as the one danger to American liberty, namely, the Roman Catholic Church. That is the only body which is popularly charged with owning "superior temporal allegiance to any power above that" due to his country; the only one said to be opposed to "complete separation of Church and State"; the only one said to menace our undenominational public school system and to be seeking the support of public funds for ecclesiastical purposes. The Catholic press has immediately recognized this new society as directed against its Church and as a new form of the Knownothings and the A. P. A., and such it evidently is. But the official circular sent out by the Guardians of Liberty, which we have received, denies and yet confesses it. It says:

"Catholic journals have attacked the Guardians of Liberty on the ground that the new organization is a revival of Knownothingism. Nothing could be farther from the fact. But Rome is afraid of the new organization, knowing that her own methods of political and ecclesiastical campaigning in this country will not bear the searchlight. Her truckling with Presidential candidates; her arrogant claim of equality with royalty for her cardinals at public functions; her attitude toward civil marriage, and her imposition of the ban of illegitimacy on ecclesiastical marriages between Catholic and Protestant; her widespread interference in politics and her dictation to the "bosses"; her declaration that "the church will not come to her own until there are more Catholics in Congress"; and her demand, reiterated in her church organs thruout the country, that American Catholics should work together "to make of the United States *according to a dream that is no longer visionary the first Catholic nation in the world*"—these are among the reasons why the free and independent American people must jealously guard their privileges against a power which has been repudiated in every country in Europe, with one solitary exception."

If this is not a revival of Knownothingism then our memory of Knownothingism is greatly at fault. The purpose of that organization, which swept the country in the 50's, was to attack the Catholic Church and to exclude its members from political office. This new organization has this Section 14 in its "Declaration of Principles":

"It shall be the duty of all members to support candidates for political office who are good and true men, earnest patriots and loyal to the principles of the Order."

That can mean nothing else than Never vote for a Catholic.

The statement issued proceeds further at length to attack the Catholic Church. It tells us that "the Roman hierarchy is a political machine . . . casting its influence in favor of those who are willing to serve, not the best interests of their country, but of the Catholic Church"; and it declares.

"Having already dictated the choice of judges, congressmen and many high public officials in State and nation, Rome is now engaged in attempting a far weightier task—to dictate the choice of a Chief Magistrate to preside over the destinies of 100,000,000 Americans."

We hold that such an organization is a menace to our political peace. It greatly magnifies the danger it sees. It is proscriptive and un-American. The former political anti-Catholic organizations had a brief and dishonorable history and past away. Protestantism and liberty do not need such defenders. We want to live in the fullest harmony with our Catholic fellow citizens, and we shall find them earnest patriots, lovers of the country's liberty, and guardians of our public schools, even against ecclesiastical interference. We have relics of union of Church and State yet left, particularly in the aid given to denominational charities, but their correction does not need the raising of the banner of religious warfare.

If our readers wish to see the full circular they should write to the Chief Recorder, Dr. Barnett, 50 West Twenty-fourth street, in this city.

Making Rubber from Potatoes

On September 13, 1906, we offered a reward of $10,000,000 to any ambitious young chemist who could tell how to accomplish cheaply the following simple reaction:

$$2C_5H_8 = C_{10}H_{16}$$
Isoprene Caoutchouc

We now hasten to add that we did not mean that we would send our personal

check for that amount on receipt of the desired information. It was rather what might be called a "rhetorical reward," intended merely to indicate our idea of what the value of such a discovery would be to the world and presumably to the discoverer. We feel it necessary to make our position clear because the task seems now to have been actually accomplished and the reward ready to be reached.

For many years there has been a close race between Germany and England to see which should solve this problem in synthetic chemistry—how close it now appears, for the English chemists reached the goal, the patent office, only three months ahead of the Germans. It is a case of poetic justice that the announcement of their triumph should have been made by Prof. W. H. Perkin, of Manchester University, for it was his father, W. H. Perkin, who fifty years ago discovered mauve, the first of the aniline dyes. But the English universities of that day disdained to teach anything so mercenary as industrial chemistry, and the English manufacturing chemists, who then dominated the world market, viewed academic training with an equal contempt. So the aniline industry, worth hundreds of millions of dollars, went over to Germany, where the university professor and the artisan work side by side.

Now, however, a new species of university has sprung up in England, combining utilitarian with cultural education. Manchester has been a leader in the new movement and well deserves the prize. In 1909 a corps of chemists in the Manchester laboratories entered upon the systematic siege of synthetic rubber. It had been known for over sixty years that rubber on being decomposed by heat produced isoprene, a liquid somewhat resembling turpentine. The reaction was known to be reversible, but nobody could tell how. But in July, 1910, it was discovered, by accident, we may say, but it should be understood that such advantageous accidents happen to those who are working for them and know how to utilize them. Dr. F. E. Matthews, who had charge of the research, set some isoprene to drying over metallic sodium, a common laboratory method of freeing a liquid from the last traces of water. In September he found that the flask was filled with a solid mass of real rubber instead of the volatile colorless liquid he had put into it. Prof. Carl Harries, of Germany, made the same discovery three months later, and on applying for a patent found that he had been anticipated.

Twenty years ago the discovery would have been useless, for sodium was then a rare and costly metal, a little of it in a sealed glass tube being passed around the chemistry class once a year as a curiosity, or a tiny bit cut off and dropped in water to see what a fuss it made. Latterly, however, metallic sodium is cheaply produced by the aid of electricity. The difficulty lay rather in the cost of the raw material, isoprene. In industrial chemistry it is not sufficient that a thing can be made; it must be made to pay. Isoprene could be obtained from turpentine, but this was too expensive and limited in supply. It would merely mean the destruction of pine forests instead of rubber forests. Starch was finally decided upon as the best material, since this can be obtained for about a cent a pound from potatoes, corn and many other sources. Here, however, the chemist came to the end of his rope and had to call the bacteriologist to his aid. The splitting of the starch molecule is too big a job for man; only the lower organisms, the yeast plant, for example, know enough to do that. Owing perhaps to the *entente cordiale* a French biologist was called into the combination, Professor Fernbach, of the Pasteur Institute, and after eighteen months' hard work he discovered a process of fermentation by which a large amount of fusel oil can be obtained from any starchy stuff. Hitherto the aim in fermentation and distillation has been to obtain as small a proportion of fusel oil as possible, for fusel oil is a mixture of the heavier alcohols, all of them more poisonous and malodorous than common alcohol. But here, as has often happened in the history of industrial chemistry, the by-product turns out to be more valuable than the product, the dump-heap pays better than the mine. From fusel oil by the use of chlorine isoprene can be prepared, so the chain is complete.

Professor Perkin calculates that by his process rubber can probably be pro-

duced at a cost of 60 cents a pound and possibly 25 cents or less. If this is correct synthetic rubber comes into direct competition with the natural product, but we do not advise our readers to throw their rubber plantation stock into the fireplace just yet. The demand is far greater than the supply. We in America use up every year a pound of rubber apiece, every man, woman and child of us, it appears from the statistics, altho obviously those who ride on rubber tires use more than those who walk on rubber heels. Between 1908 and 1910 the price of rubber in New York rose from 84 cents to $2.90 a pound, but this was because the Brazilian forests were becoming exhausted and the Ceylon plantations had not come into bearing. No such fancy prices may be expected in the future, but the possible uses of rubber are so multifarious in our modern civilization that a slight fall in price opens up to it new opportunities. But whether made from potatoes and corn or grown on plantations, rubber will henceforth be free from the red stain it has borne. The sudden enormous demand for the milk of the rubber tree in the last few years has driven men to search for it into the darkest parts of the two southern continents. In these secret places, far beyond the reach of law and religion, cupidity begot cruelty, and the world has been horrified at rumors of slavery, torture and mutilation; in the Kongo by the Belgians; in Peru by the English. Such atrocities will be impossible under the new conditions of the industry. The new discovery means a step upward in morality as well as an advance in science.

Governor Dix on Bryan

Governor Dix says that Bryan is now out of it; he is eliminated; he no longer has power. But Bryan is not out of it; he still has power. His enemies, whom he defeated, now abuse him, but they had to do what he asked, vote for Governor Wilson. Governor Dix says: "The canker of selfishness was eating his heart; now the party has eliminated him." We see no public evidence of any such selfishness. There was no sign at the convention that he did not desire the nomination of Wilson, and there has been no utterance of his since that he is not pleased at the result, or that he is disappointed that the tide did not turn to him. The only thing that could be so interpreted—or misinterpreted—was his suggestion of four names of men whom Progressives might vote for if it should become necessary to turn to a dark horse. The interesting thing about those names is their catholicity, one of them, Senator O'Gorman, of New York, a Catholic, and another, Senator Rayner, of Maryland, a Jew. The plank in the platform which denies Wilson a second term, if he should be elected, will allow Bryan to be candidate in 1916, and he will not then be too old.

The Philippines and Siam

For the credit of Congressman Jones, of Virginia, and the report of the Committee on Insular Affairs which he lately presented, recommending a bill to give full independence to the Philippines after eight years, we trust that other statements are not as flagrantly untrue as is the following passage in reply to the objection that so many languages are spoken in the Philippines:

> "There are many different dialects spoken in Siam, and yet this non-Christian country, with no standing army, has never fallen a victim to any land-grabbing nation."

The contrary is the notorious fact. Siam has had piece after piece of its territory bitten of successively by Great Britain and France during the last fifteen or twenty years. The boundary between Burma and northwestern Siam was "delimited" in 1891 to the advantage of Great Britain. In 1896 an agreement was had between Great Britain and France as to where they would put their respective Siamese boundaries, and this was amended to mutual advantage in 1904, the territories to the west of the Menam River and the Gulf of Siam being recognized as English and those to the east as French. Also in 1904 the French took possession of provinces to the west of the Mekong River to the amount of 7,800 square miles. In 1907 a new boundary was forced upon Siam whereby four ports on the Mekong were by perpetual lease ceded to France and the territory of French Cambodia was enlarged by 7,000 square miles. In 1909 Great Britain took over 15,000 more

square miles from Siam which were added to her Malay possessions. We are surprised that the Senate should have been so misinformed, for all Siam is liable to be gobbled up in a few years, much as the Philippines would be if we let them to themselves. To be sure, as the committee suggests, there might be an agreement of the interested nations to leave them alone, but such conventions are often changed later.

The Weakness of Journalism

A special cable to the New York *Times* conveys to the American public the following intelligence:

> London, July 5.—G. K. Chesterton while walking in his garden Wednesday, fell over a tub of flowers and fractured his right arm.

The dispatch, however, neglects to explain the motive for the accident, which is presumably to demonstrate Mr. Chesterton's theory of journalism. This theory he expounded some time ago in "The Ball and the Cross" in these words:

> "It is the one great weakness of journalism as a picture of our modern existence, that it must be a picture made up entirely of exceptions. We announce on flaring posters that a man has fallen off a scaffolding. We do not announce on flaring posters that a man has not fallen off a scaffolding. Yet this latter fact is fundamentally more exciting, as indicating that that moving tower of terror and mystery, a man, is still abroad upon the earth. That the man has not fallen off a scaffolding is really more sensational; and it is also some thousand times more common. but journalism cannot reasonably be expected thus to insist upon the permanent miracles. Busy editors cannot be expected to put on their posters, 'Mr. Wilkinson Still Safe,' or 'Mr. Jones, of Worthington, Not Dead Yet.' They cannot announce the happiness of mankind at all. They cannot describe all the forks that are not stolen, nor all the marriages that are not judiciously dissolved. Hence the complete picture they give of life is of necessity fallacious; they can only represent what is unusual. However democratic they may be, they are only concerned with the minority."

We hope that the pleasure of being able to say "I told you so" will compensate Mr. Chesterton for the pains he has taken to prove his point, and we hope also that he will not think it necessary to subject his personality to the strain of demonstrating experimentally in all its details his opinion of "What's wrong with the world."

That Deceased Wife's Sister

Next to the suffraget the deceased wife's sister is the most troublesome feminine element in British politics—and the most effective factor in the evolution of the British Constitution. For years she was the bone of contention between the House of Commons and the House of Lords and now she is the entering wedge between Church and State. The metaphor is mixt, but then so is the situation. It has always been claimed by churchmen that the Established Church was really as independent as the free churches, that the State in giving it support and privileged position exacted in return no sacrifice of autonomy. This claim has now been upset by the deceased wife's sister. Here is Canon Thompson, vicar of the parish of Eaton, who, in accordance with the dictates of his conscience and the Prayer Book, excluded from communion Mr. and Mrs. Bannister because she was the sister of his first wife. Such had been the law promulgated by that stickler for marital morality, Henry VIII, but repealed by Parliament in 1907. Since then such marriages have been legal in England, as they long had been in the British colonies. Mr. Bannister began suit to secure his admission to the altar, claiming that the canon had no right to debar him as "an open and notorious evil liver," when he was living in accordance with the law of the land. The case was carried up thru the Court of Arches. the Court of the King's Bench, the Court of Appeal, and, lastly, the House of Lords, being decided in every instance against the priest, who now, it seems, will be forced to admit the parishioners under penalty of contempt of court. The appeal to Cæsar has been successful, and it has been settled that among the things that are Cæsar's is the right to decide who are offending God by their manner of life, and so to be debarred from communion with Him. Now that the real subordination of the Established Church is thus laid bare, an increasing number of churchmen are coming to realize the rationality of the principle of the Nonconformists who are willing to sacrifice money and prestige to secure ecclesiastical freedom. It is a curious thing that in all this agitation for the right of marriage with a deceased wife's sister the

analogous case has been ignored. A man may not marry his deceased brother's widow, nor apparently does he want to. Such a marriage is still held as incestuous in England as well as some of the colonies, and it would be interesting to know why there is no demand for the repeal of the law or complaint of its hardship as there was in the other case. Statistics show that young widows are more apt to marry than spinsters, but seemingly they never want another of the same family.

The New York Observer

It is not easy to keep a Presbyterian paper alive in this city. We regret to see that *The Observer*, which claimed to be the oldest of our religious papers, has died of old age and the conservatism that too often goes with old age. Some seventy years ago its conservatism was such that *The Evangelist* was started as a rival Presbyterian paper, with Dr. Joshua Leavitt as editor, representing the new evangelistic activity of which President Finney was the representative; and it became the New School organ, as *The Observer* was the Old School. *The Observer* was severe against THE INDEPENDENT when the latter was started in 1848, being opposed to almost everything which this journal represented; and between *The Observer* under Dr. Prime and *The Evangelist* under Dr. Field there was no love lost. Both were good properties for many years, but the age of tolerance and good will came with the union of the Old and the New School Presbyterian bodies, and at last neither of them was needed, and finally *The Evangelist* was absorbed in *The Christian Work*, and now *The Observer* has ceased to exist. We cannot pretend that it was in its best days a really helpful journal, altho Dr. Devins, who took charge of it when the Primes past away, was a man of fine spirit and gave it a character for religious service and Church unity. The principal name connected with it for many years was that of Samuel Irenaeus Prime, a man of dignity and presence, familiar on the platform at all great religious meetings. One who knew him well recalls this little story of his personal urbanity. He sat in his office in his shirt sleeves on a very hot day, when a lady, a stranger, called to see him. Instantly he arose to put on his coat, and she begged him not to put himself to the trouble of doing so. "Madam," said Dr. Prime, "if I would not do this out of respect to you, allow me to do it out of respect to myself." Another lady compiled a volume of fugitive religious poems, and hoping to secure it a larger sale asked him to give his name to the title page. This he did, adding his steel portrait, and he enjoyed remarking that his friends told him it was the greatest *hymn* in the volume.

"A Century's Start"

A moderate degree of self-glorification is not bad for a nation nor for a political, social or religious organization. It should respect itself and should demand that respect. Its superior merits it should claim, with due regard to courtesy and truth. We are not of those that see any special menace in the Roman Catholic Church, but it is not wholly agreeable to see its leading organs glorifying it and depreciating the Christian faith of the rest of us in ways that are plainly apart from the fact. We see frequent illustrations of this which are not worth considering, but *America* claims to be the special representative of intelligence and fairness. It speaks thus of American religious history and present conditions:

> "Other religious bodies had the start of us by over a century of power. They were then a hundred to our one. In the mean time we have grown and they have dwindled until now we have attained numerical equality. Why have they not made better use of their opportunities? Half their people today have no religious tenets and the other half are not sure of the tenets they profess."

Now what are the facts? Catholicism had the start of Protestantism by over a century in this country, with every chance for development and growth under hospitable skies. The largest part of this country was settled by Spanish and French colonists before the English landed on the Atlantic coast. Arizona as far back as 1540. New Mexico was conquered in 1508, and Santa Fé was founded in 1605. California, Texas, Utah also were part of the Spanish territory. In fact, up to 1803 everything west of the Mississippi was either Spanish or French; and east of the Mississippi Flor-

ida was settled by Spaniards, while the French made the first settlements in Maine, Vermont, along the Great Lakes, and along the eastern bank of the Mississippi, as the French names of cities still attest, while Maryland was settled by English Catholics. It is not true that "other religious bodies had the start of us by over a century." The contrary is the fact. The other claim, that the Catholics have attained numerical equality, could hardly find credence from its readers. It is based first on the claim that Catholics number 15,000,000, a sixth of the population, and that of the remaining population one-half "have no religious tenets," and half the rest do not believe what they profess; while the 15,000,000 are all true to their faith. Courtesy, logic and truth are all lacking in such boastings.

The Virgin of Lourdes Pius X has just had a fountain of water in the Vatican gardens closed up. This fountain was part of the Grotto of the Virgin of Lourdes, built under Leo XIII. A curious reason, that is, from the standpoint of Catholic pilgrimages, is that the Pope feared the water was bad and might spread disease. At Lourdes, France, where is the original miraculous fountain, the water flows on and pilgrimages are frequent. Among them were lately one hundred English pilgrims, of whom thirty were cripples. At Separation in 1907 the French authorities resolved to wipe out the waters of Lourdes and inhibit pilgrimages. But the hotelkeepers of the town in union with the Paris, Lyon and Mediterranean Railway protested they would lose too much money. The government yielded. Among the railway directors, was Mons. Emile Loubet, whose visit as President of the Republic to the King of Italy brought to a head the rupture between France and the Vatican.

Farm Doctors The Independent has recently noted the tendency to create a class of farm experts, to be scattered about the country, and given the general oversight of the agricultural interests of the whole United States. One of our Congressmen writes, himself a lawyer: "I am myself no farmer, but what I know about it I have gained thru converse with the Agricultural Department at Washington and the farmers' clubs." He tells us that he has made up his mind that farming as carried on is a shiftless affair, and that "thirty bushels of wheat can just as well be grown to an acre as fifteen." He concludes that at least one-third of the animals fed by the dairymen need weeding out, because they do not produce milk in quantity or quality to pay for their keep. This is his excuse for securing what he calls a "farm doctor," a man to give advice, and perhaps more, to give momentum in the way of adopting new measures and weeding out the useless. It will be the duty of this superintendent to study soils, and crops, and animals in the Congressional district to which he is appointed. He will spend his entire time in the interest of improved farming. He will visit farmers at their homes, find out if they have any plans, and aid them in formulating something definite "for improvement." He will study every phase of farm life, indoors and out, helping to introduce new methods, to secure the utilization of water power, and helping to make electricity a common power in our farm homes. He will study market conditions, and means of transportation, making a specialty of road improvement and introduction of the best tools. It is expected he will be of decided value in heartening up a man who is discouraged over bad crops, where they are the result of lack of knowledge. In other words, he will be an agricultural adviser; and if he is skillful in winning the confidence of the people will be of untold value to the agriculture of the section. He will try to get rid of superfluous equipments; see that tools are not spoiled by exposure, and in other ways farmers' interest go to waste. One difficulty on many farms is that the work is so planned as to rush for a brief season, leaving little to be done when help is most easily obtained. This is the fault of bad planning or management as a rule. It is thought that the farm adviser or farm doctor, as they seem inclined to term him, will cost about twenty-five hundred dollars a year (some place it at twenty-two hundred). It is proposed that the Government furnish half of this, provided the locality or section will furnish the other half. The proposition is very reasonable, consider-

ing that the Government has already done a large share of the educating of these experts. The movement may go slow at first, and probably will; but where men of good judgment and adequate training are employed they will create a want that will be so strongly felt that we may look for a national movement of the sort to be completed.

With the Fourth of July the American flag began to be adorned with six rows of stars and eight stars in each. It may be a long time before a new order is required, altho we do not see why Hawaii and Porto Rico should not be made States before long, and the Philippines later, notwithstanding the Congressional declaration when we annexed the Philippines that it was not the intention to make States of them. Yet the Spanish Cortes had members from Cuba and the Philippines, and Cambodia, Anam and the Africa possessions are represented in the French Chamber of Deputies.

The New Orleans *Picayune* says: "Altho Louisiana is stanchly Democratic, she cannot for an instant contemplate the removal of the tariff on sugar, or even its revision, without serious alarm. The sugar industry in this State has grown up under the assistance afforded by the tariff for several generations. . . . The constant agitation of the matter is therefore extremely harmful, and President Taft was eminently wise in holding that all tariff problems should be eliminated from politics." What is a Democrat, anyhow?

We regret the action of the Philadelphia Board of Public Education, which has sent word to private schools whose pupils have been admitted to the Normal School that henceforth their pupils will not be received, as the building will not accommodate all who apply from the high schools of the city. Then it should be enlarged, or an annex rented. It looks like an unhappy discrimination, possibly a religious one. If only a limited number can be received why not provide a competitive examination?

We wait in vain to see Mr. Roosevelt respond to Senator La Follette's challenge that he publish his expense account for his campaign for nomination at Chicago. Mr. La Follette gave his campaign receipts for the Ohio primary contest, but Mr. Roosevelt, twice challenged, still holds mum. He had the backing, so Senator La Follette declares, of the Steel Trust and the Harvester Trust and the big magnates, and the Senator is inquisitive as to the amounts of their contributions and what was their purpose.

The only explanation for the apparent hospitality of the Spanish Government to the bands that form on its Portuguese border for the purpose of overthrowing the republic of Portugal is that Spain wishes it overthrown. For months these bands have been harbored and are just now trying to cross the border. A Portuguese republic is a peril to Spanish monarchy.

President Taft has again done Cuba a good turn. He was not hasty to intervene, but gave plain warning, urged the Cuban Government to suppress the rising, sent down war vessels to show that he was in earnest, and then called them back when the outbreak was supprest.

It is a fearful burden which Russia assumes, to expend $645,000,000 in five years on a new navy; and it will involve additional waste on overburdened Great Britain, Germany, France, Italy, Japan and the United States.

We are glad to have this endorsement from Mr. Bryan, who says: "Nearly all the Democratic party and more than half of the Republican party are Progressives." Mr. Bryan speaks with authority, having attended both conventions.

Governor Osborn, of Michigan, one of the seven Roosevelt Governors, says he will swing to Wilson, for Wilson is a good enough Republican for him. Those Western Republicans have no interest in the tariff.

Wesleyan University has won its million-dollar endowment, but probably it will not prove of value enough to make up for the loss of the women students.

Insurance

State Rating Fails

THE action of the Louisiana Legislature within a fortnight in repealing the law enacted two years ago, establishing, under the auspices of the State, a bureau or commission charged with the making and regulating of rates of premiums for fire insurance, is significant. Louisiana has ever been regarded as among the safe and sane communities, politically, in the South, and, when the radical measure which has just been repealed was adopted, the departure from conservatism was noted with astonishment by those best acquainted with the people there. It seems to be evident that the attempt to regulate the price of fire insurance by law has, in the judgment of the thinking classes in that State, proved a failure. If this conclusion is correct it is fortunate for those who have that form of protection to pay for that their Legislature has discovered the mistake and promptly rectified it.

We hold to the opinion that the cost of all forms of insurance is lowest in those places where the companies are least hampered by laws which interfere with the economics of that business. Well managed companies know what risks are worth, and all the laws in the world will not seduce them into doing business at a loss. They will have their legitimate price or they will refuse the risks which will not pay it.

The Home Insurance Company

OUR attention is attracted to some interesting facts brought out in a recently published review of the Home Insurance Company of New York appearing in an insurance journal. In the fifty-nine years of its existence the Home has received the total sum of $239,062,555 in premiums, and it has paid for losses $133,106,577, an experience of 55.7 per cent. The gross expense ratio has been estimated at 35 per cent. of the premiums, while the total outstanding liabilities, composed largely of unearned premiums, about equals 6 per cent. of the total premiums received. According to this calculation the *underwriting* profit during fifty-nine years has been but 3.3 per cent. of the premiums handled, or about $7,890,000. On December 31 last the net surplus of the company was $13,815,441—something like $5,110,000 in excess of the earnings from *underwriting*. The *investment* earnings were about $24,980,000. This came from interest, rents, profits on the sales of securities, and the like. The total dividends paid stockholders amounted to $18,965,000—leaving about six millions of investment earnings to go into the surplus funds and strengthen the security of policyholders. From which it appears that the stockholders of that company have not, as a matter of fact, received any of the *underwriting* profits, while the banking side of the business has contributed most substantially toward making that institution the financial giant it is. The story is a record of superb fire insurance management.

A REPORT recently issued by the New York Insurance Department of an examination made of the New York Safety Reserve Fund of Syracuse severely criticises some features of the management, especially its methods of settling claims.

THE New England Casualty Company of Boston has taken over the assets and business of the Bay State Surety and Liability Company and increased its own capital to a million dollars. The New England recently became a member of the Workmen's Compensation and Service Bureau.

THE fact seems to be well settled that some fire insurance company of importance has secured an option on a majority of the capital stock of the Williamsburgh City Fire Insurance Company at about 550 per cent. of its par value. At one time it was thought the Alliance of London held the option, but that idea is now evaporating. The name of the prospective purchaser has not been divulged.

Financial

Politics and Business

THERE was additional evidence, last week, that the unusual political conditions have not been permitted to depress general business. The stock market was still a narrow one (1,487,896 shares), and at the end a slight net loss was shown, but the record for three strenuous political weeks has been one of dull firmness. Many were waiting for this week's crop report, but the general expectation was that it would be a favorable one. Good news from the wheat fields had caused a decline of price. The steel mills were very busy, and there were further advances of prices and wages. There was an unprecedented output of steel, and the Pittsburgh district entered the new half year, it was said, with a larger accumulation of forward business than it had seen since 1907. General trade was, on the whole, satisfactory. The underlying conditions were known to be sound, and the prospect was believed to be good. Political wrangles had not killed a prevailing feeling of optimism.

It was shown by the *Journal of Commerce* that our railroad and industrial corporations in the first half of the year had announced $1,557,146,400 of new securities. This output exceeds that of the first half of 1911 by $327,000,000. The figures relating to railroads show a decrease of $14,000,000, but it is to be noticed that railroad notes and bonds were less by $77,000,000, while railroad stocks increased by $63,000,000. This shifting testifies to a growth of confidence on the part of the investing public. Industrial securities rose from $374,000,000 to $716,000,000, and here $222,000,000 of the gain was in stocks. Both on account of quantity and because of the tendency toward shares rather than toward bonds, this six months' record is of an encouraging character, as indicating confidence and optimism. The recent monthly circulars of prominent banks and banking firms point to the fact that political events have caused no alarm or uneasiness in business circles. The prevailing opinion appears to be that the success of either party, with such candidates as have been nominated, should not be awaited with misgivings; that nothing revolutionary or injurious to honestly conducted business can be expected. Many are thinking more about the crops than about the party conventions or the campaign.

The Year's Foreign Trade

ALTHO the exact amounts cannot yet be ascertained, it is known that our foreign trade in the fiscal year just ended exceeded $4,000,000,000. This is a new record. Last year's total was $3,576,546,000, and the total for the preceding year was less by about $375,000,000. The value of manufactures exported was more than $1,000,000,000. These included $275,000,000 for iron or steel products; $160,000,000 for lumber and leather and manufactures of the same, and $50,000,000 for cotton goods. The growth of exports of manufactures supplies arguments in favor of a reduction of the tariff duties involved. The Government might well undertake to ascertain to how large an extent protected manufactures are sold for export at prices lower than those which our own people are required to pay for them.

....It is understood that the Money Trust inquiry will not be resumed by the Banking and Currency Committee until after the elections in November.

....On June 30, the end of the fiscal year, there were 7,394 national banks, having an authorized capital of $1,040,545,435 and an outstanding circulation amounting to $745,134,992.

....The Government's cotton report, last week, shows that the planted area falls below last year's by 2,584,000 acres, or 7 per cent., but still is larger than that of any year preceding 1911.

....June's output of pig iron was 2,440,745 tons, against 2,512,582 in May. The output of the first half of the year has been a little more than 14,000,000 tons. Each half of 1911 had less than 12,000,000.

The Independent

VOL. LXXIII NEW YORK, THURSDAY, JULY 18, 1912 No. 3320

Survey of the World

National Politics

Movements and expressions of opinion concerning the projected new party excited much interest last week. There was additional evidence of a tendency in certain Progressive Republican organizations to support Governor Wilson, but it could not be said that a majority of the members of such organizations were inclined to take this course. On the other hand, the disapproval of a new party by several Governors and other prominent men did not necessarily indicate opposition on their part to the Roosevelt movement. Some who were not willing to support the Chicago nominees desired to remain in the old party. There were so many opinions and such a variety of local influences that it was impossible to classify the dissatisfied and generalize as to their policies. It could be seen, however, that Mr. Roosevelt and his active supporters intend to take advantage of the party machinery in States where it is controlled by their friends and to seek the votes of Presidential electors in those States without putting up a separate ticket. Reports were published as to Republican electors who intended to vote for Mr. Roosevelt. Some estimated that there were seventy of these; others said the number was nearly one hundred. A new Taft ticket of electors will be set up by petition in Pennsylvania and two or three other States; similar action will probably be taken in the interest of Mr. Roosevelt in several States where the party organization and the electors already chosen are opposed to him. The prediction is made that these methods will lead to litigation. There was speculation in the press about what would take place if no one should have a majority of the electoral college, and if the election should be thrown into the House, where there would probably be a tie of States. Mr. Roosevelt decided to make speeches in the Middle West during a tour of ten days. Mr. Taft named his secretary, Charles D. Hilles, to be chairman of the National Committee in the campaign. Mr. Roosevelt said that the anti-Trust law ought not to be enforced strictly; the great combinations had come to stay, and should be subjected to supervision and regulation by the Federal Government. A letter written by Dr. Lyman Abbott was published, in which he denied that Mr. Roosevelt was "addicted to the excessive use of alcoholic liquors":

> "He is quite as temperate as I am. He never touches whiskey, has never tasted a cocktail in his life, and his customary drink when he lunches with me twice a week is either milk or iced tea. During the Chicago convention he did not touch a drop of any kind of alcoholic beverages."

Senator La Follette published a long article attacking Mr. Roosevelt sharply. Bryan at Baltimore, he said, "was a towering figure of moral power."

> "Roosevelt at Chicago, backed by money derived from the stock watering operations of the Steel Trust and the Harvester Trust, organizing what are now confessed to have been fake contests as to nearly two hundred delegates in order to control the convention and secure his own nomination, refusing to aid in making a progressive platform, bound to have the nomination or to destroy the Republican party, was a most striking example of misdirected power and unworthy ambition."

Mr. Roosevelt, he continued, had enough delegates "ultimately to have nominated a real Progressive." He could even have caused the nomination of Hadley on a strong progressive platform:

"He would have no one but himself. He was there to force his own nomination or smash the convention. He was not there to preserve the integrity of the Republican party and make it an instrument for the promotion of progressive principles and the restoration of government to the people. . . . He gagged his followers in the convention without putting on record any facts upon which the public could base a definite, intelligent judgment regarding the validity of Taft's nomination. He submitted no suggestion as to a platform of progressive principles. He clamored loudly for purging the convention roll of tainted delegates, without purging his own candidacy of his tainted contests and his tainted Trust support. He offered no reason for a third party, excepting his own overmastering craving for a third term."

——Speaker Clark called upon Governor Wilson at Sea Girt, last week, and talked with him two hours. "His position," said the Governor, "is admirable in every respect." It is expected that William F. McCombs will be chairman of the national committee. Charles R. Crane, of Chicago, who contributed to Mr. La Follette's fund, has recently been a guest of the Governor, whom he will support. The Governor will insist upon the fullest publicity, before and after the election, for every contribution to the Democratic campaign fund. —— The Prohibition party, at its national convention, renominated the ticket of four years ago, Eugene W. Chafin, of Arizona, for President, and Aaron S. Watkins, of Ohio, for Vice-President. Several delegates favored the choice of a new name for the party, some suggesting Progressive, others Liberal or Conservative. The temporary chairman, Clinton N. Howard, denounced the old parties and the new one projected by Mr. Roosevelt. "We already have two whisky parties," said he, and do not need another. Mr. Roosevelt was, in his opinion, the least desirable of the candidates. "Posing as the thou-shalt-not-steal candidate, he brazenly boasts that he stole the Isthmus of Panama from Colombia." As for Mr. Taft, no other President had surrendered more abjectly to the liquor interest."

A Protest from Great Britain

Senator Brandegee, chairman of the committee which has the House bill relating to Panama Canal tolls, was informed on the 10th inst. by Secretary Knox that Great Britain's diplomatic representative had asked for delay with respect to this bill until his Government's Ambassador could submit a diplomatic note about it. The bill, as passed by the House, and as supported by a majority of the Senate committee, exempts from tolls American ships engaged in the coastwise trade and excludes ships owned by railroad companies whose lines are naturally in competition with the steamship routes. Two days later, Mr. Knox sent to the committee a summary of the British note, just received, which was to be followed by a written argument, forwarded by mail from London. The British Government, according to this summary, having considered the various propositions concerning American ships, holds that exemption of all American ships would involve an infraction of the Hay-Pauncefote treaty; that there would be no difference in principle betwen charging tolls, only thereafter to refund them, and remitting such tolls altogether; that a subsidy, calculated particularly with reference to use of the canal, would not be in accordance with the obligations of the treaty, and that it would be impossible to frame regulations for the exemption of ships in the coastwise trade "which would prevent the exemption from resulting in a preference to American shipping, and, consequently, in an infraction of the treaty. It is understood that a more elaborate note will object also to the provisions concerning ships owned by railroads, and that this objection will be made in the interest of the Canadian Pacific Railroad Company and its steamships. The House opposed the exemption of coastwise ships, but was overridden by the House. Senator Brandegee opposed it, but was outvoted in his committee. Such exemption is called for by the Democratic platform. There is a conflict of opinion in Congress, as may be inferred, as to the relation of such exemption to the requirements of the treaty, but exemption is clearly favored by a majority. It has been sug-

gested by the London press that if the bill in its present form should be enacted, the resulting controversy would be taken to the Hague tribunal. Some predict that there would be retaliatory discrimination on Canada's Welland Canal and elsewhere. Congress is not inclined to delay the proposed legislation. On the 13th the Senate, upon Mr. Brandegee's motion, by a vote of 40 to 34, made the bill the unfinished business, and thus decided to proceed with the consideration of it.

Lorimer and Archbald

The Senate, on the 13th, by a vote of 55 to 28, adopted a resolution declaring that corrupt methods and practices had been employed in the election of William Lorimer, of Illinois, and that his election was invalid. This action was preceded by a debate of seven days. Mr. Lorimer himself spoke for twelve hours, on three successive days. Several Senators who defended him attacked Mr. Roosevelt. The discussion was full of bitter personalities. Mr. Lorimer denounced Mr. Taft, Mr. Roosevelt and many who had opposed him, especially those connected with Chicago newspapers, who had procured and published the testimony upon which the proceedings against him were based. In the course of his remarks he read the affidavits of three Southern delegates to the recent Republican convention, who swore that attempts to bribe them in the interest of Mr. Roosevelt had been made. These affidavits had not before been given to the public. Mr. Tillman was so affected by parts of Mr. Lorimer's speech that he wept and sobbed. He had a statement read when the vote was taken. Part of it was as follows:

"Since I was stricken with paralysis thirty months ago, I have thought often and seriously about death and the hereafter. That I am here at all is in some respects a miracle, and I know I must go hence and meet the Great Judge very soon. Knowing that, I cannot do otherwise than vote as my conscience dictates, and I believe this man is innocent of the charges brought against him. If he is driven from the Senate, as seems probable now, I hope he will consecrate his life and his great talents to the purification of politics in his native city, and the uplift of his fellow citizens in Illinois to a realization of their duty and danger. But whether he is expelled or not he ought to do this, and I believe if he does bravely fight for a purer and better government in Illinois God will strengthen his arm and he will return to the Senate vindicated by the people of that great State."

Mr. Cullom, who voted for his colleague last year, explained that new evidence had caused a change of his attitude. The vote was as follows:

Against Lorimer.—Ashurst, Bacon, Borah, Bourne, Briggs, Bristow, Brown, Bryan, Burton, Chamberlain, Clapp, Clarke (Arkansas), Crawford, Cullom, Cummins, Curtis, Dixon, Fall, Gardner, Gore, Gronna, Hitchcock, Johnson, Kenyon, Kern, La Follette, Lea, Lodge, Martin, Martine, Myers, Nelson, Newlands, O'Gorman, Overman, Page, Poindexter, Pomerene, Rayner, Reed, Root, Sanders, Shively, Simmons, Smith (Arizona), Smith (Georgia), Smith (Michigan), Smith (South Carolina), Stone, Sutherland, Swenson, Townsend, Watson, Williams, Works.

For Lorimer.—Bailey, Bradley, Brandegee, Burnham, Catron, Clark (Wyoming), Crane, Dillingham, Fletcher, Foster, Gallinger, Gamble, Guggenheim, Johnston, Jones, Lippitt, McCumber, Oliver, Paynter, Penrose, Perkins, Richardson, Smith (Maryland), Smoot, Stephenson, Thornton, Tillman, Wetmore.

When the vote was announced, Mr. Lorimer arose and left the Senate chamber. According to newspaper reports, Mr. Roosevelt says it was his fight and victory, because "the whole thing would have been dropped" if he had not refused to attend a public dinner if Lorimer should be present.——The House, on the 11th, by a vote of 220 to 1, impeached Judge Robert W. Archbald and appointed seven managers to appear before the Senate and demand his removal from office. These managers are Chairman Clayton and six other members of the Judiciary Committee. The single vote for the Judge was cast by John R. Farr, who represents the Judge's district. Judge Archbald, Mr. Farr said, was incorruptible and the soul of honor. On the 8th, thirteen articles of impeachment had been presented to the House by unanimous vote of the Judiciary Committee. The charges relate mainly to his business transactions with actual or possible litigants. He was appointed a District Judge by President McKinley in 1901, reappointed by President Roosevelt, and was made a Circuit Judge and assigned to the Commerce Court by President Taft in 1911.

Rates of Express Companies

In connection with a report of 600 printed pages, the result of an investigation which has been in progress for three years, the Interstate Commerce Commission has ordered a reduction of about 15 per cent. in the rates of express companies, drastic reforms in regulations and practice, and comprehensive changes in methods of operation. The report was prepared by Commissioner Lane. The largest reduction proposed affects rates on small packages, and the Commissioner thinks that it opens avenues for the direct transfer of products from the farm to the city household, while loss of the companies' revenue will be prevented by an increase of traffic. The companies will be required to make thru routes by the quickest and most direct lines. To simplify the great volume of rate schedules, the United States will be mapped out in blocks about 50 miles square, and the entire system of rates from one block to any other can be printed on one large sheet of paper. The report analyzes the relations of the companies to railroads and groups of capitalists, asserting that by an interlacing of stock ownership and otherwise all the companies are managed by three groups of interests. The companies will be heard on October 9. They have accepted all the proposed changes except the reduction of rates.

Guarding Against Plague

Sanitary precautions were taken last week at all the Atlantic and Gulf ports, notably at Key West and New Orleans, to prevent the admission of bubonic plague. In many ports the extermination of rats on the harbor fronts was sought. In Mobile, Norfolk and several other cites a bounty of five cents per head was offered. Only one new case of the disease in Havana was reported. It was a fatal case. One case, the first at that port, was found in Santiago. In Porto Rico there have been 34 cases (a majority of them in San Juan), and 22 deaths. It is believed that the disease was brought to that island from Trinidad, where it first appeared at the end of March, and where there have been 13 cases, with 9 deaths.

End of the Cuban Rebellion

General Monteagudo telegraphed to President Gomez, on the 10th, that the revolt in Oriente had been suppressed and that martial law was no longer needed in that province. He intended, he said, to start for Havana on the 18th, leaving 3,255 soldiers as scattered garrisons in the eastern end of the island. According to an official report, the Government's losses since the beginning of the revolt have been 16 killed and 34 wounded. Documents found on the body of General Estenoz, the rebel leader, and undoubtedly written by himself, are regarded as proof that Gomez conspired with him to cause the rebellion. One, addrest to Secretary Knox, set forth charges against the Gomez Government, and another was a bitter attack upon Gomez, in reply to the latter's proclamation calling upon the Cuban people to put down the revolt. ——President Gomez asks Congress for authority to borrow $11,000,000 for sewers and other public improvements. This is criticised. In the House, Representative Andre asserted that Mr. Dickinson, when he was in the Cabinet at Washington, had forced modifications of the sewer contract which were burdensome and injurious to Cuba.——The rebellion in Santo Domingo continues. There have recently been battles at Moca and La Vega, with considerable losses.—— In Panama, Pedro Diaz, the Government's candidate for the Presidency, has withdrawn, leaving a clear field for Dr. Belisario Porras. Diaz's supporters, in a manifesto, allege that frauds at the polls in the recent municipal elections were permitted and approved by the United States supervisors.——Secretary Fisher will make a personal investigation of the charges of Delegate Kalanianaole, of Hawaii, against Governor Frear. The Delegate asserts that the latter is a reactionary and is too friendly toward the sugar interests.

The Revolutionists in Mexico

General Huerta and his army entered the city of Chihuahua on the 7th, but a considerable part of his force at once went forward, in the direction of Casas Grandes, to prevent the passage of Orozco's men into Sonora. A

majority of Orozco's soldiers went to Juarez, where for a time there was danger of mutiny, as they could get no pay and had very little ammunition. Orozco arrived in that city on the 10th. Huerta prepared to attack and capture Juarez, but was delayed by the destruction of the railroad. The city will be taken easily, for a garrison of only 200 rebels was left there on the 12th, nearly all of Orozco's soldiers having moved westward, intending to carry on guerrilla warfare in Sonora and to obtain possession of a Pacific port, where, they said, they could get supplies from the Japanese. On the 12th Orozco issued the statement:

"The revolution in Mexico will triumph because it is just and has the support of the Mexican people. That the forces of Madero occupy from day to day points of importance is not regarded as important since they never will be in control of more soil than that upon which they stand. A Government which shamelessly violates the laws, which commits monstrous electoral frauds, as was done recently in the Congressional elections, will have to bear the weight of national indignation. The Mexican people have a right to liberty, and they will have it when they have a President who respects the law and who does not trifle with it."

There is a United States warrant out for his arrest, if he should be found on American soil. The charge is murder, the victim having been Leroy Fountain, an American who commanded a Maderist machine gun battery at the siege of Parral, who was court martialed after his surrender, and who was shot a day or two later by his guards. Madero has offered amnesty to all rebels who shall surrender within thirty days. Dominguez, one of Orozco's colonels, and 500 men have accepted this offer in negotiations with Huerta. Mormon colonists who live about 80 miles south of Douglas, Ariz., fear attack by Orozco's men. Acting in their interest, Senator Smoot, of Utah, has directed the attention of our Government to their condition. A majority of them are American citizens.

The Dockers' Strike

The strike of the dockers in London shows no signs of settlement, and the distress among the poor and the injury to business is great and increasing. According to the reports of the Board of Trade the imports for the last month fell off more than two million dollars and the exports five million dollars. The loss of the strikers in wages is estimated at five million dollars. Minor riots and attacks by the strikers upon strikebreakers are of almost daily occurrence. The union funds were long ago exhausted, and organized charity is unable to take care of the cases of actual starvation. The bishops of London, St. Albans and Southwark have issued a joint letter to the press in which they plead for help for the starving women and children, and call attention to the slight difference of position which is causing the prolongation of the struggle, in the following language:

"The men express their willingness to go back to work at once, if, after they have gone back, a committee shall be formed, containing some of their representatives, to examine into the question of their grievances on the basis of Sir Edward Clarke's report.

"The employers, on the other hand, declare that on the resumption of work the freest submission of grievances will be allowed to the employes and just and generous consideration will be promptly accorded to them.

"Can it really be upheld that this slender margin of difference justifies the continuance of the misery to individuals and loss to the community which this strike involves? Any real investigation of the alleged grievances must involve some consultation with the men. Cannot some arbitrator having the confidence of both sides suggest a formula which may bring the employer and the employed together, and thus close a dispute which is causing untold misery and injuring the whole country?"

On the other hand, Lord Devonport, who is invested with the Port of London Authority, refuses absolutely to yield any point and replies to the bishops as follows:

"The Bishops who are raising the relief funds would be better advised if they counseled all the men to return to work instead of exerting their influence in the direction of inducing the Authority to consent to some condition or conditions precedent to men resuming work. Again and again it has been declared by the Authority that no such arrangement will be entertained. The strike originated in a despotic attempt to coerce all workmen to accept the domination of the Transport Workers' Federation

"I venture to think that the labor leaders are trifling with a situation of pathetical gravity and the Bishops and others would do better to direct their attention to the real problem of rescuing the dupes of these leaders from the results of their unjustifiable action by counseling the men to resume work."

The Conviction of the Camorrists

The leaders of the Camorra who have been on trial at Viterbo ever since March 11, 1911, were on July 8 found guilty of the murder of Gennaro Cuocolo and his wife. The presiding judge submitted to the jury 144 questions as to the guilt of the accused, each one of which had to be answered by "yes" or "no," and in the case of "yes" another ballot was to be taken as to whether there were extenuating circumstances. The verdict declares Corrado Sortino guilty of both murders; Nicolo Morra, Antonio Cerrato and Mariano Di Gennaro guilty of the murder of Cuocolo, and Giuseppe Salvi guilty of the murder of Cuocolo's wife; Enrico Alfano, the alleged leader of the Camorrists; Giovanni Rapi, treasurer of the Camorra; Di Marinas and the others are convicted of being instigators of the crime and members of a criminal organization. As soon as the prisoners in the big steel cage realized that the decision of the jury was unfavorable they burst into a storm of curses, cries, tears and threats. Altho the prisoners had been carefully searched before bringing them back into the court room they were not to be prevented from doing themselves bodily injury in their excitement and despair. Two of them beat their heads against the bars of the cage until the blood was streaming down their faces, and Di Marinas cut an artery in his throat with a piece of glass and was with difficulty prevented from bleeding to death. Italian law does not allow the death penalty, so the sentences imposed by the judge were as follows: Sortino, Cerato, Salvi, Morra, Di Gennaro, Alfano, Rapi and Di Marinas were sentenced to thirty years' imprisonment and to ten years' police surveillance; Di Matteo to ten years and six months' imprisonment and ten years' surveillance; Ascrittore to ten years' imprisonment and three years' surveillance; Ciro Vitozzi, the priest, to seven years' imprisonment and two years' surveillance; the others to five years' imprisonment and three years' surveillance. The convicted men will be removed to Rome and there confined in various jails. A large force of police and soldiers had been assembled at Viterbo in order to protect the court and prevent the rescue of the prisoners. The jury will be carefully guarded for the next six months for fear of assassination by the Camorra. The church opposite the court house was occupied by the wives, mothers and sisters of the accused, who spent the night burning candles and offering prayers to the Madonna and St. Rosa, the patron saint of Viterbo. The great interest which the trial has excited thruout the world is because it was in effect a trial of strength between the Italian Government and the criminal gang which has for many years dominated the Neapolitan district, promoting crime, interfering with justice and corrupting politics.

Royalists Attack Portuguese Republic

Some months ago it was reported that the exiled King Manuel had come to an agreement with Don Miguel and his sons as to the succession in case of restoration, and that the two royalist factions would unite in another attempt to overthrow the republic. This attempt has now materialized, but seems so far to have been as futile as its predecessors. The leader of the movement in this case, as formerly, was Captain Henrique de Palvo Couceiro, and he was enabled again to assemble his forces on Spanish territory, along the northern frontier of Portugal, apparently without any interference on the part of the Spanish Government, notwithstanding the remonstrances which have been repeatedly made by Portugal and backed, it is said, by England and France against such a violation of the laws of neutrality. The Carlists of Spain are believed to have aided in the revolt against the Portuguese republic. Premier Canalejas stated that the strictest orders had been issued to prevent Portuguese conspiracies from being formed in Spanish territory, and that all leaders and accomplices would be arrested. Nevertheless, the royalist forces crossed the boundary into the province of Tras-os-Montes at three points, with the intention, it is believed, of making Braga their objective and there establishing a royalist camp in the expectation that the inhabitants of the northern territory would rally to the King's standard. But such royalist risings as occurred were

easily handled, and the invaders did not succeed in getting beyond Chaves and Montalegre. Driven off at first from Chaves, Captain Couceiro returned unexpectedly to the attack on July 9 with nearly a thousand men and six quick-firing guns. The garrison numbered only 200, but they held off the enemy for five hours, when a troop of cavalry arrived and took the royalists in the rear, while at the same time the garrison made a sortie. Caught thus between two fires Captain Couceiro had difficulty in retreating to Spain, having lost 92 men killed and 150 wounded. The republicans captured one or two of his field guns and 217 prisoners. The town of Cabeceiras de Basto declared for the King, and the inhabitants, led by the parish priest, armed themselves with guns, pitchforks and scythes, and were reinforced by 800 royalist troops from over the border. But when the government troops arrived to attack the town they found it deserted, both soldiers and citizens having fled to the mountains. Altho the royalist bands have been dispersed, yet the danger is not over, for in this mountainous region guerrilla warfare can be carried on indefinitely, since the inhabitants are anti-republican in their sympathies. The attempt to blow up the bridge across the Minho, which forms the boundary between Spain and Portugal near the coast caused but little damage. The plot to incite a mutiny among the troops at the capital simultaneously with the invasion was foiled by the Government.——A patriotic parade took place in Lisbon, and the Belgian consulate was cheered because of the seizure of the steamer "Vos" at Zeebrugge, loaded with arms for the rebels.

The Korean Conspiracy

The trial of the 123 Koreans now being carried on by the Local Court of Seoul has important political and religious implications. Among the accused are several teachers and many students of the Sinsyong School, at Syonchon, a Presbyterian institution under the management of Rev. Mr. McCune. Among the Methodist converts implicated in the conspiracy the most prominent is Baron Yun Chiho, who was formerly a member of the Korean Cabinet. According to the Japanese public prosecutor the prisoners in their preliminary statements last April testified that the leading American missionaries in Korea were aware of the plot for the assassination of Count Terauchi or had encouraged the movement. Four Methodist and fourteen Presbyterian missionaries are implicated in these alleged confessions. Among them is Bishop M. C. Harris, now sixty-six years old, who went to Japan as a missionary as early as 1873, and was in 1894 elected by the General Conference Bishop of Japan and Korea. Bishop Harris has always stood well with the Japanese Government and was decorated by the Mikado in 1893 and again in 1905 with the third class Order of the Sacred Treasure. The Rev. Dr. Samuel A. Moffat who is also named, is president of the theological seminary at Pyen Yang. Dr. H. G. Underwood, the first Protestant missionary to enter Korea twenty-six years ago, is likewise involved by these incredible accusations. When the prisoners were brought up for trial on June 28 most of them denied the truthfulness of the alleged confessions, which they claimed had been extorted from them under torture or threats. Korean papers outside the country assert that the prisoners were beaten or hung by their chins until they were ready to sign anything dictated to them. According to the statements of the prosecution a secret society was formed in 1905 for the purpose of freeing Korea from foreign rule. It was called Sinmin Hoi, the New People's Society. One of their plans was to establish a military school in West Chientao, for the training of patriotic soldiery. After the annexation of Korea by Japan in August, 1910, it was decided by some of the conspirators that a violent demonstration would be necessary in order to arouse the Korean people to revolt, so they planned to take the life of Count Terauchi, Japanese Governor-General of Korea. Twice in December they assembled in large numbers at the railway stations where Count Terauchi was expected to stop on his visit to New Wiju, but he either failed to alight from the train or the police protection was too strong for them to attempt to shoot him with the revolvers which they secreted under their cloaks.

Sidelights on the Contests

BY VICTOR ROSEWATER

[Mr. Rosewater, editor of the Omaha *Bee,* presided over the sessions of the Republican National Committee and of the convention itself until Senator Root was elected temporary chairman. Despite his modest disclaimer no one can speak with more authority than he in regard to the question of contested delegates, upon which Mr. Roosevelt primarily justifies his bolt.—EDITOR.]

THE invitation to contribute to THE INDEPENDENT an article on the question of the contested delegates at Chicago opens up a field broader than I can possibly cover. Being neither a lawyer nor a contest expert, and having no longer immediate access to the records, I could not assume to explain the contests in detail, but having presided over the sessions at which they were submitted, perhaps I can throw a few sidelights helpful to a better understanding of the case on the part of the public.

In the first place, it should be remembered that the tentative adjudication of contests by the national committee in making up the temporary roll is no new thing. Four years ago I sat thru the contest hearings which determined titles to 216 delegates' seats, and this year the same duty devolved upon the committee with reference to disputes over 262 seats. I mention the number of contests particularly to show how impossible it would be for any one acting in the capacity of juror, or judge, to remember the circumstances and issues of all of them as presented in quick succession. Four years ago the fact soon developed that of the 216 contests presented to the national committee, the vast majority of them—I should say nine-tenths of them —were absolutely fictitious and trumped up by inspiration of trouble breeders. That the same was true to almost as great an extent this year, when the number of contests totaled 262, likewise quickly became apparent. As case after case was either withdrawn or fell of its own weight under the unanimous vote of the committee, the Roosevelt men and the Taft supporters joining in condemnation, it was inevitable that suspicion should attach to all of the cases championed by the same contest attorneys who had practically confessed to the perpetration of these fakes. It may be said, without fear of contradiction, that most of the contests in the Southern States followed the appearance of a mysterious stranger who had, by some occult power or covert influence, set in motion unsuccessful place hunters and other discordant elements for some reason dissatisfied with what the regular organizations and their conventions had done.

A word as to committee procedure: The necessity for a code of rules governing contest hearings is self-evident. It was recognized by the national committee four years ago by the appointment of a sub-committee of three members to draft such a code, and the report of this committee was at that time unanimously adopted. It provided for executive sessions, thirty minutes to a side for State contests and fifteen minutes to a side for district contests, subject to extension of time on motion or restriction on agreement for consolidation, withdrawal of contestants and their attorneys after presentation of the case, and immediate decision by the committee without debate by *viva voce* vote unless demand for a roll call were sustained by 20 members. The committee which formulated these rules consisted of George H. Cary of Oregon, F. B. Kellogg of Minnesota, and Frank Streeter of New Hampshire, Mr. Kellogg being the only one of the three remaining on the national committee. When the question of rules arose this time, the draft which Mr. Kellogg had helped to frame was no longer satisfactory to him and those associated with him as the Roosevelt floor managers, and they asked for various changes. Their

demand for publicity was met by a modification of the requirement for executive sessions, the doors being opened to the extent of permitting two representatives of the five great press associations to be present throughout the proceedings, an arrangement for taking down stenographically every word uttered, and making the transcript available daily to any of the press correspondents who might wish to examine it. The demand for reducing the number required to order a roll call was not met, the committee adhering to the view that a lesser number than two-fifths would merely stimulate dilatory motions and encourage filibustering, when at best it would be difficult to complete the work ahead in the limited time without night sessions. I believe it was wise to accord full publicity to the contest hearings, although the effect was to turn attention and remarks from the evidence and arguments to the reporters at the press tables, ever on the alert for smart sayings and sensational outbursts.

Another point which should have a bearing on the public attitude is the manner in which the Roosevelt people treated their own memberships on the committee. Of the fifty-three committeemen, two were supposed to favor the candidacy of LaFollette and twelve or thirteen the candidacy of Mr. Roosevelt. At various stages of the proceedings the Roosevelt spokesmen made loud objection to partisans sitting in judgment in these cases, altho in no instance did any one vote on any case in which he was personally interested. The Roosevelt members, however, seemed to regard their seats on the committee as mere voting rights to be transferred at will, and from the outset scandalously overdid the privilege of being represented by proxy. At the opening session one of their proxies was given over to the political correspondent of a friendly Chicago newspaper, and later those proxies were passed around among Mr. Roosevelt's campaign managers and advisers, and even contest attorneys, to be voted in favor of seating Roosevelt delegates irrespective of the evidence or merits of the case. When the California contest was presented Francis J. Heney sat at the attorneys' table, and at its conclusion moved over into a proxy's seat to vote on other contests. The same performance was repeated by an attorney who represented the Roosevelt side in the Michigan contest. Governor Hadley, Governor Stubbs, Judge Deuel, and Lucius Littauer as members of the Roosevelt "strategy board" sat from day to day on proxies, voting them for the Roosevelt contestants whenever a division was had. Later the Roosevelt people in minority reports to the convention protested against participation in the credentials committee of members of the national committee who had already heard the cases—a protest unprecedented and unheard of—but carefully refrained from making objection to Mr. Heney's membership in the credentials committee, altho Mr. Heney had proxied himself through the whole contest proceedings before the national committee, and his name was incongruously signed to the protest.

The admitted manufacture of three-fourths of their contests, the farming out of proxies to be voted irrespective of the evidence, the flagrant resort to epithets, personal abuse and gallery plays, were naturally not calculated to help win contests which at best might turn upon the benefit of a doubt. Their methods of presentation also could not but react, for while the code governing hearings prescribed, as I have said, certain rules to be observed, the Roosevelt people persistently recognized no rules, and set about deliberately to evade them. By courtesy of general consent, members of the committee were permitted to ask questions to elicit further information without charging up the time thus consumed. Seizing upon this loophole certain Roosevelt representatives on the committee would post themselves in advance as to points at issue, and then, under pretense of asking questions, would argue the case over again after the time for presentation had expired, often forgetting or neglecting to put the question mark at the end of their remarks. In this fashion the interrogators, ostensibly serving as judge or juror, behaved more as a battery of prosecuting attorneys. Not content with this, on several occasions they undertook to reargue again after the contestants had withdrawn, and

could no longer answer back, under the guise of offering explanations of their votes.

Looking backward at the whole proceedings, and comparing the hearings of this year with those of four years ago, I am convinced that as a rule the contests instituted by the Roosevelt people were not set up with any idea or expectation of having their delegates seated, but for the purpose, first, of making a showing in the published claims of pledged delegates, and second, of laying a foundation for the cry of fraud in the event they failed to control the convention. Fortunately, no one is called on to inquire what might have happened had the Roosevelt campaign managers been in control of the national committee, and counted a majority of its members as subservient as those which they voted by proxy.

OMAHA, NEB.

The Martyrs of the Law

BY ARTHUR HOBSON QUINN

THERE was murder in Carroll County and the sheriff had taken his man.
But thru the hills and the valley the ominous rumor ran
That if ever the word was spoken that sent to jail their kin
The Allens would rear a shambles where the court of law had been!

But still untouched by the terror, the law had had its way;
Floyd Allen stood for sentence in the peace of a quiet day.
Silent, unfettered, he stood there, his face the hue of stone,
And it seemed that his clan had left him to bear his fate alone.

Then ere a word was uttered the door swung open wide,
And the pride and strength of the mountain strode noisily inside.
Around the judge and the jury and the officers of the law
The circle slowly tightened, and Thornton Massie saw

That he framed his own death sentence, but he rose and the dingy room
Took on the spell of splendor as he spoke the words of doom!
Then the guns roared out their answer, and the judge fell on his face
And the murky smoke of murder spread thru the tainted place.

Goad, who read the record, and Foster, who made the plea,
Fell in the self-same volley, but ere the room was free
From the shock a pistol sounded, and each man held his breath
As the sheriff of Carroll County strode in to his certain death!

Cruel were the odds against him, but the odds were naught to him.
For his bullet found Floyd Allen ere the sight of his eyes grew dim.
Then down with Massie and Foster, on the growing heap on the floor.
In his clutch the empty weapon that his hand should use no more,
He dreamed that he still protected the dead that round him lay,
Till the thirst for murder slackened and the Mountain rode away.

Massie and Webb and Foster—long may their memory live,
Who had naught to give but their life blood and gave what they had to give!
They died for thy laws, Virginia—on thy historic breast
No braver sons have fallen, no truer heroes rest!

Not in the roar of battle, when the blood runs strong and high.
In the stiller paths of duty they laid them down to die.
And the nation that is waiting, with half-averted ear,
For the low and distant murmur that the Future has to hear,

Should make their names the slogan of the Cause their vision saw—
The sanctity of human life and the majesty of law!
The slogan that shall echo till it drowns all local cry—
The Cause our lives must cherish lest our great Republic die!

UNIVERSITY OF PENNSYLVANIA.

The Progressives

BY N. O. NELSON

[Our readers need no introduction to Mr. N. O. Nelson, the St. Louis millionaire who is giving all his time and money to improve the moral, economic and social life of the people.—EDITOR.]

WHAT is it the Progressives propose to do? Revise the tariff downward. That should reduce the prices of the one-twentieth part of the things which constitute our "living." If they reduce the tariff 20 per cent., it would reduce our cost of living 1 per cent. The great majority of us use practically nothing imported or in any manner touched by the tariff. Land, houses, cotton, clothing, shoes, agricultural foods, doctor, preacher, schools, public expenditures, etc.

The reduction in protected goods would have to come out of the manufacturers and their employees. So far as this reduces the profits of the manufacturers it would reduce the accumulation of capital. But capital is the means of production of which we need more and more as population increases. We have none too much now. The railroads have not enough. They cannot make needed improvements; many of them are facing receiverships; municipalities are hard prest. Any important reduction in the protective tariff would mean a corresponding reduction in wages, and in many cases, closing up.

I want a revenue tariff, but I know what it means: a long period of adjustment and serious hardship in changing the work of many people. I also believe it will have no such sweeping benefits as the Progressives promise.

The Interests. The interests are manufacturers, railroads, bankers. What is it the Progressives propose to do to them? They have been under fire as long as I remember; they have been legislated about and prosecuted in court. With what results? Regulation has helped them to improve their methods and make more money; it has saved the railroads from rebates, bribery and blackmailing passes, and lobbies. It has saved the banks from defalcations, bad loans and illegitimate competition. It has minimized restraints of trade to trade's advantage, it has induced consolidations in which there is economy and stability. The only further step would be the fixing of prices, and this no Progressive has yet proposed. So far as political influence goes, there is at least ten times as much influence in ten partnerships as in one corporation when consolidated.

Is it direct legislation, the initiative, referendum and recall? In this they are not pioneers or lone champions, but even this is but a means, to what end? What laws do they propose to pass or reject? Shall we vote more intelligently or honestly for measures than for men?

Substantial progress would be made By measures which would equalize the livings of industrious people, bring the 85,000,000 of common people and the 7,000,000 of uncommon closer together; the Progressive statesman and his farming and wage-earning constituents on a par of income and style of living; the professor, preacher, social worker, lawyer, millionaire, clerk and laborer, fellow citizens equal in fact as well as in political theory. Let them ponder well and make it part of their platform and campaign oratory that when the total production of this country is about $250 per head, the Progressive leader and all others of the upper class shall not consume $1,000 per head and upward. Let them promise to cut out all the personal and public extravagance of Congressmen and officials and campaigning.

They promise to conserve the public land and water power; they can conserve a hundred times as much by holding on to all the future increment in land values, if not retrieving the increment of the past.

The greatest economic progress of all would be to introduce, by a vigorous protective policy, the co-operative business system which is so extensively used

and universally approved in the European countries and in some parts of this, by which the people are enriched. Big business is shorn of its profits and equal economic opportunity is assured.

There is a big field for Progressive statesmen and measures, but these Progressives are tinkerers who will stop no leak in the roof, plug no hole into the bottomless pit of poverty.

New Orleans, La.

Moving—Whither?

BY THE RT. REV. CHAUNCEY B. BREWSTER, D.D.

Bishop of Connecticut.

SOCIETY cannot be stationary; for human life is essentially movement, it is always a becoming. Therefore we need not wonder at finding ourselves in a period of transition.

The more thoughtful observers of the time, even among Socialists, are recognizing that changes of the social order may be expected to come thru slow and gradual processes of evolution rather than by violent revolution. We may seem to be moving in a socialistic direction. That, however, is true of a certainty only to this extent. Our world is becoming more social, in the sense of being less individualistic. We are daily becoming accustomed to things, in school and workshop and business office, that sixty years ago would have seemed strange indeed. It is evidently an age of combination, of corporations, syndicates and trusts, and of unions and federations. Notwithstanding any attempts to put the clock back, there seems a reasonable hope of moving forward, out of the chaos of mere individualism with unrestrained competition and continual strife, into the more cosmic order of regulated combination and co-operation on a large scale.

In short, we are coming to a more organic conception of society. There is increasing recognition of the need of some reintegration of the life of men. There is deepening conviction that in its essential reality the social body is an organism with its parts vitally related, so that the health of the whole is involved in the health of each and any part; that various elements of society ought not to be in continual conflict but should be in harmonious relations within the life of the whole; that there must be found a reconciliation of clashing classes in some kind of co-operation, a co-ordination of State action and corporate and private interests, and an organic and vital correlation of the individual and the social wills.

Human life, however, in thus becoming more organically social, is not going to be less truly personal. Personality is the consummate outcome of the age-long process of evolution, the prime and distinctive endowment of human nature. Any development which should ignore or undervalue, suppress or in any wise lower personality would be not genuine progress but retrogression. It is to be hoped and reasonably expected that the further process, the evolutionary correlation of social elements into a more consciously and explicitly organic whole, will be not mainly thru governmental authority repressing personality but thru wholesome liberty of development wherein personality shall find fullest realization in social relations.

Such a process would mean much in many ways. It would mean the free play of personality in its diversity of gifts and powers. It would mean everywhere allowed and encouraged originality and liberty of initiative and achievement under such regulation only as would prevent unfair advantage and ensure others from exploitation and any injustice.

It would mean for organized labor less of tyrannous compulsion and more of large-minded leadership; an abandonment of the policy of reducing work to a low level and limit of productivity; an intelligent welcome of scientific manage-

ment with its possibility of increased product and pay and shorter hours, provided there be no speeding at the expense of humanity. It would mean free and full recognition that capital and labor have other relations besides those of antagonism; that labor needs capital, that the more capital there is the greater the demand for labor and the higher its wages; that capital needs labor, and labor efficient because not dissatisfied but interested. It would mean employers who will rate a man higher than a machine and rights of humanity above rights of property. It would mean employers enlightened enough to see that there is coming something wider than any autocratic or oligarchic control of industry, that it does not belong to the employer to "run my business to suit myself," but that in a sense it is the business also of the men employed in it and of the public to be served by it; that no paternal care of the welfare of workers, howsoever benevolent, will suffice; that the day is passing when men will be content to labor under conditions determined for them and regarding which they have not some voice and vote themselves.

In the socialistic state, men who worked for the government might find themselves more helpless than they are now. Indeed, against individualism there is a remedy other than that proposed by socialism. Present evils might be best met, not by more of government, as the Socialist dreams, but by more of brotherhood, between man and man and between class and class, than he will at present hear of.

This would mean that the representatives of capital and labor should get together, no longer as enemies but on the ground of some mutual interest, and work the complicated problems out together. Is that a wild dream? It is true the situation has recently been grave enough. But evidently things cannot long go on thus. Evidently we have had war enough. Even today signs are not wanting of something else, signs of promise as to better understanding, and even something like co-operation between combinations of capital and federated labor. The National Civic Federation, as is well known, brings together representatives of employers, of organized labor, and of the general public. Its position is not that the interests of capital and labor are identical. Those interests, however, while not identical may be mutual, and in most cases admit of adjustment and reconciliation. Last November, at Atlanta, the convention of the American Federation of Labor, by an overwhelming vote, rejected the demand of Socialists that members of labor unions should retire from membership in the National Civic Federation. Significant might be the outcome of the labor battles at Grand Rapids in the plan of an organized alliance between the Furniture Craftsmasters and the united Furniture Craftsmen, provided it be not one more scheme aimed against the labor unions. It is true the unions have sometimes abused their power and failed to abide by agreements. It is probable, however, that fuller recognition would tend to make them more responsible. At any rate, there is sure to be war so long as combinations of capital refuse to recognize combinations of labor. When the right of workmen to organize for collective bargaining shall be freely recognized, and for that right they will no longer have to battle, then it is to be expected that they will be more ready to recognize the rights of non-union men, who now seem to them traitors, and will be altogether more amenable to reason.

A wisely constituted Federal commission on industrial relations might do much in preparation for a new epoch. There is some ground for the hope that one day may be seen at least the beginnings of a true industrial democracy which shall secure at once the liberty of each and the welfare of all, and find a general and fraternal interdependence not incompatible with wholesome personal independence. Such an outcome would be more social than the socialism that, compressing individual units into a vast economic system, would result in a mere aggregation of atoms and be individualism under a new name. On the other hand, this vision of the future contemplates a society made up of groups of persons associated together. There is created a certain community of mutual service as men come together in relations of dependence upon each other, and as each group is associated with

other groups in mutual dependence within the State or nation. Thus economic interdependence, under conditions bettered as suggested, would tend to knit men together in organic relationship. But, under governmental administration of industry and transportation, each citizen being a shareholder in the one great producing power, the state, such mutual relations of interdependence between men would be far less likely. Dependence upon the state, as general employer, provider and distributor, would make against that common consciousness of mutual dependence which might otherwise be effective to bind men together.

This new order would be more genuinely democratic than aught the socialist offers. It would be a social order transcending socialism on the one side, and on the other at once more particular and more universal. It would be more particularly democratic in its full recognition of the essential worth of each man by reason of the personality that is the distinguishing attribute of human nature. It would be more widely democratic in its perception of some fundamental unity deeper than all distinctions of class or race or fortune, a profound basis for thought and labor on behalf of humanity.

Over against the dreams of the socialists may be cherished the vision of a divine goal of human progress. That new order of things, seen afar off, involving the development of the social organism and at the same time not suppressing but rather developing and enriching personality, is none other than the Kingdom of God coming on the earth, slowly, little by little. Nothing else than that rule of God's righteousness can suffice. It involves social relationship. It is a kingdom. But it is a kingdom of persons. It alone affords deep foundation and high sanction for the democratic ideal, in the equal solemnity of all human lives notwithstanding any inequality in natural endowment or outward fortune. It alone reveals that unity which because spiritual is vital, a vital force to build up a truly organic social structure, and is also the divine secret of a genuine brotherhood of men. It alone, with its new valuation of all values, can at once dignify and spiritualize labor, moralize capital, exalt, as the end for ambition of service, above wealth the commonwealth, furnish the reason for respect and honor to all men, and inspire sympathy and effort, enthusiasm of interest in, and unsparing sacrifice on behalf of, any and every human being made in God's image and redeemed by Christ.

HARTFORD, CONN.

The Slaughter of the Innocents

BY ROSE TRUMBULL

"O MOTHER, see the mill lights in the darkness glow!"

"I see but candles for my dead
At foot and head."

"Nay, see how wrought by childish hands, world-fabrics grow!"

"I see my babes, decrepit, bowed—
They weave a shroud."

"Yet see their golden wage: the purse of wealth is deep."

"The tide of barter at its flood
Gives bread for blood!"

"O mother, with thy visions dark, dost thou not weep?"

"For slaughtered babes upon such biers
There are no tears."

SCOTTSDALE, ARIZ.

The Fat Side of the Farm

BY C. J. COLDEN

I HAD my chance on the farm. I passed it up cheerfully, and without a single pang packed my wooden trunk and leaped into the two-coach passenger train for fear father might change his mind. When I was promoted to head shipping clerk at fifteen a week I decided that it was sufficient both for myself and the lady of my dreams, and Lucy became my own.

I pounded away from week to week. Promotions came regularly. My family increased by three and my salary arose to $150 a month. I occupied a comfortable flat on a fashionable street. For twenty-five years, thru dust and grind and shattered nerves, I have stuck to my job. My family has pleasant prospects and I have the reputation of a country boy who has made good. With a modest degree of pride in which I share, Lucy has kept the boys back home posted as to my salary and promotions.

One hot summer morning, the washing day, I arose tired and worn from a tossing, sleepless bed. For two long nights I had suffered for rest. The passing motor cars, the midnight parties, the footfalls upon the floor above, irritated me into a frenzy. These nervous attacks were becoming more frequent and followed the weeks of overwork. I telephoned the office and secured relief, and was making an impatient effort to keep cool and quiet on the back porch when Lucy announced a letter from Skidmore, near our old home.

Eugene Hall, a schoolboy friend, had invited me to make him a visit. I hurried a telegram, packed my suitcase, and at five in the evening stepped off on the station platform from which I had so hastily departed twenty-five years before.

My friend 'Gene was there to greet me with a hearty shoulder slap, the introduction to a jolly reception. His daughter Tillie, a charming girl with the brown eyes and happy features of her father, accompanied him. With pleasure I observed her admiring the diamond sparkling on my favorite cravat. I enjoyed being the center of curiosity of the station loungers and determined to make the impression as favorable and as happy as possible.

Instead of the dusty carriage and the heated drive I had pictured, we raced away in his auto over hills and down thru hollows, along smooth roads which, 'Gene explained, had been dragged for a motor prize tour. He called it the Saints' Highway, and I concur in its having an honorable christening. What I had dreaded as a tedious trip proved an evening delight, and before I realized it, an hour expired, and we honk-honked at the gate of his farm.

Eugene Hall was rightfully proud of his home. He enthusiastically showed me the rooms, the piano, the library with its magazines and popular books, the typewriter, the telephone; and he spoke of the satisfaction of the daily newspaper since the establishment of rural free delivery. He showed me how the water in the bathroom and in the kitchen was supplied by the windmill, and we finished in the basement, inspecting the laundry conveniences, the acetylene gas plant for lighting and the furnace system of heating.

I'll admit that I was surprised to find that Eugene Hall was experiencing more of the comforts of life than I had anticipated. He gratified my curiosity unasked:

"Didn't get these new-fangled notions until the last few years; since Tillie and Jim have been attending the agricultural college we have made some changes. They got to arguing the question with me and I saw it was either whip up a bit or the children would lose interest in the farm, so I got busy and you can see for yourself what has been done.

"Lester," he said, "you ought to see the difference it makes. Now, when they come home from college on a vacation they bring some friends along for

an auto ride and to show them our farm. They used to be ashamed of it; they're proud of it now. By doggies, old man, it's the best money we ever spent." His face beamed as he slapped his knee.

I referred to the tennis court on the lawn and learned that it was another college notion adopted by the progressive youngsters, who were also equipt with football, basketball, croquet and some "baseball junk," as 'Gene exprest it.

The evening was occupied by reminiscences and by a discussion of the innovations of farm life, particularly in the way of amusements. I learned that the county seat boasted of a golf club, and that another was contemplated. I heard of the field days of the surrounding townships, the enthusiasm of the outdoor contests, the rivalry of the local ball clubs; just as interesting were the discussions and criticisms of the lectures, concerts and entertainments which my friend had heard at the winter lecture course or at the chautauqua in Skidmore's maple grove. These new experiences contrasted strangely with my country life of twenty-five years before.

'Gene and I drifted to our boyhood amusements, or, rather, to the social desert in which we were reared; how we arose with the chirp of the first birds of the morning springtime, and drudged and plodded until the last row of corn was husked in the bitter snow time. It seemed humorous, now, to recall that in boyhood days, when the crops were cribbed, we were permitted to yield to the luxurious indulgence of an extra hour of slumber every morning, remaining snugly tucked under grandma's crazy quilt until the tall and trustworthy Seth Thomas chimed I, II, III, IV, V.

Eugene and I took an inventory of our boyhood playthings: there was the leather covered ball which we made by unraveling the legs of worn out woolen, home-knit socks and winding the yarn about a leaden bullet; the cover was made from the top of a discarded boot. Another was the penciled pine board which served the double purpose of a crock cover and a checkerboard; sometimes our board was accompanied by twelve black buttons and by twelve white ones, but often our treasures were confiscated for the family clothing, and then we resorted to grains of corn. Four horseshoes with the corks worn smooth, a pop gun of elderberry, a whittled top from a cotton thread spool, completed the list.

Such were the magnetic instruments of relaxation when labor slackened and "dad" was away from home or we beyond his sight. The old-time singing school, the writing class, the country debating society, were unable to survive the frigid atmosphere. In winter time we played the part of junior Nimrods, minus a gun, hunting for rabbits with "Shep"; and in summer, after Sunday school, we exercised the same instinct by carrying water and by flooding the underground homes of the squirrels in the back pasture.

A busy memory was reviving my boyhood fancies of the city's roaring fun, a tired brain was wrestling with the missed opportunities of wholesome farm amusement, when in the moonlight shadows of this quiet country place my nerves relaxed in restful sleep. I was admiring the glow of a glorious morning when 'Gene burst into my room.

"Lester," his voice rang cheerily, "do you know these new-fangled cooking schools are a great success? Tillie never took much interest in house work until she studied domestic science. Before she went to the agricultural college, she looked as if she had a pain every time you mentioned the kitchen or dishwashing. Now she calls it the cooking shop; says she has converted the kitchen into a laboratory, and she gives me a lot of high-sounding talk about science and chemistry and sanitation. Jim is just as much in earnest about testing the soils, breeding corn, and hunting for bugs and flies in the orchard. These chaps of mine are college scientists, and they call me an 'accident' farmer!"

Most agreeably, our conversation drifted to schools and to their influence upon farm life. 'Gene was an enthusiastic advocate of the proposed township high school, suggested by the progressive teacher of the district, Nellie Tobin, a graduate of a college of manual arts.

"She began," said 'Gene, "at $40 a month and now we're paying her $75; she is worth more and she knows it.

She wants us to haul the children to school, wants a big brick modern building, with five acres for athletics, trees and a garden. She is getting tired of borrowing phonographs for the school and says we ought to buy one with a hundred selections of the best music; then she wants a moving picture machine for geography and history. Miss Tobin says cooking, sewing and farming can be taught right here better than anywhere. Do you remember Fritz Schram? Just like he always was; eleven children, 160 acres of mortgaged cockleburs and laying awake nights scheming to defeat the township school."

"Those were solid old textbooks we boys wrestled with," I suggested to 'Gene; but I was unprepared for his explosive reply.

"Yes; solid as blocks and as hard to digest. I've got mine yet; back there in the library. I cuss every time I see them. You remember that I never rushed the head of the class very often. I got so disgusted trying to spell and to give definitions of words that I never met before or since! What's the use of screeching such stuff as this:

'Lochiel! Lochiel! Beware of the day,
When the Lowlands shall meet thee in battle array!'

"Who is Lochiel, anyway? Does any one know? Does any one care? What does Lochiel know about running a farm or earning a fellow's bread and butter?"

I had never looked at it just that way. While not admitting that 'Gene was altogether correct, I was forcibly imprest with the fact that he was thinking out his own problems in his independent manner, and that I was devoting the energies of my mind and body to an employer's ideas and service at $150 a month.

Tillie ushered me into the library for self-entertainment during the chore hours. Ignoring the popular volumes and the reference books, I inspected the discarded school texts with 'Gene's anathema still ringing in my ears. My forefinger plucked the faded back bearing the dimmed letters, "New Fifth Reader." Carefully fingering its frayed leaves, I gave its familiar selections an attentive inspection. It proved a worn and dusty volume of abstract philosophy, the wisdom of the jurist, the periods of the orator, the polemics of the pastor and the epigrams of the moralist, intermingled with the voice of the patriot and the music of the poet. From title page to "Finis" not a spark of inspiration to fire the farmer boy's ambition to supplant the soil-robbing burrs of the adjoining farms with the rejuvenating clover bloom.

An arithmetic arrested my attention. The crown of district school honor was reserved for that pupil who, in the presence of critical visitors and the haughty directors, could, without the slip of a syllable, recite the rule for long division, the rule of compound proportion, cancellation, the Connecticut rule of interest for partial payments, and finally the rule of cube root in a finishing climax. Did this memory-burdening, reason-wrestling book of fascinating figures prompt us to weigh the white-faced steer or the iron-gray mule? Did it invite us to measure the fields, the barns, the stacks, the corded wood? Did it urge us to compute the area of Bagby's swimming pond or the width of the Nodaway River?

A school day friend, the third one, faced me: "A History of the United States." With Eugene Hall's protest prompting me, I marveled at the innumerable dates of unimportant consequence, the statistical battles of dead and wounded, the lurid pictures of Indian treachery, the dry skeleton of governmental growth which weighted down its cyclopedic pages. Not until this moment, as I recalled the lessons of historical rote, did I realize why I had always been disturbed by a desire to be a soldier. This honored volume contained 400 pages of invitation to leave the farm and to enlist in the martial ranks following the fife and drum. The pages were closed to the development of our marvelous system of education, the progress of peace, to the beneficent influence of commerce and industry.

The geography, wide and worn, reopened its iridescent pages of an interesting world—away from home. Reviewing its foreign allurements, its geographical unpronounceables, I discovered one of the reasons why the country-

imbued Eugene Hall was a dull boy in books. On one page a smoking chimney stood towering above a shoe factory, presenting an inviting picture, without a monosyllable of the toil and grime and grind within; a Chicago packing house, with walls of might attracted without a moan of brute or sickening stench. Pittsburgh steel mills were displayed without a word of destructive gases or oven-roasting heat; coal mines without a horror of dark and dank and danger. Dazzling Broadways invited with no sad faces; while the gay ships floated in the smooth seas that know no nausea.

This boyhood geography contained not one suggestion of map drawing of school yard, or of the fat-acred farms and the lazy streams, abounding in real capes, real islands, real geography; too much Europe, Asia and Africa; no time for the selection of a cabinet of home products by making excursions to the fields and forests. This book was a vessel of strange polysyllables; a vacuum of utility so far as it concerns the farm.

Unlike my friend of boyhood, I excelled in geography. The capitals, the nations were at my tongue's command. No river, no lake, no cape, no city on the Atlas-ironed spheroid escaped my inquiring mind and searching eye. Finisterre, Friesland, Fiji, Hong Kong were unable to hide from me; yet I was stone-blind to the geographical possibilities to be seen by a furtive peep out of the schoolhouse window. The rocks, the soils, the muddy streams, the plants and animals, wild and domestic, suggested no lesson. Geography, to me, was an excursion to foreign lands and to city places.

"Have these school books, to which I was so loyal, led me away from my acre of diamonds?" I inquired, in meditation. "Did my devotion to study deprive me of a farm, rob me of sleep and steal my independence? Can it be true? Perhaps——" But I stopped to reassure myself. "Have I been worsted because these pages are partial to the factory and ignore the farm? Besides, this attractive country home may not be paid for. I, at least, am not in debt and have a few hundred reserved for emergencies. Eugene may not be so prosperous as he seems."

Replacing the geography, I pulled forth the English grammar. It, too, was recreant to country life; no exercises in rural observation; no drills in daily dialog; no personal narration; no local description; no sketches of familiar characters; no practice in correcting school yard syntax. Not a line, not a lesson to link the attention of the country pupil to the life and the land about; but every page piled high with dead rules, abstract definitions, difficult declensions, confusing conjugations and dry quotations. Its dearth of needful utilities was as amazing as its abundance of scholastic technicalities: a youthful sorrow, a pedantic delight.

The venerated speller, the knotty mental arithmetic, those twin friends of kerosene nights, were trudging into my vision like captured culprits when Eugene Hall entered with an invitation to take another motor run. There was a freedom in his manner and in his thought not emanating from the school books which had warped me out of the orbit of early life.

We whirled between the fragrant orchard rows—an appled corridor of leafy green.

"Sold all these windfalls to the plow factory folks last year," announced Eugene, with a wave of the hand. "Got 50 cents for every bushel; brought me $275. They're a dead loss this season. Did you see the garden? Tomatoes and stuff going to waste by the bushels; sold $150 worth of truck last year; rotting on the ground like these apples. No market since the factory moved away."

Before I could inquire the cause of the factory's removal he continued:

"Joe Buckley was out here last week. Says he's mighty sorry the plow factory had to move to the city, and he's mighty tired of paying $30 a month for a brick-oven flat and living on dried fruit and stale vegetables. Wants to come back to his cottage and half acre, where his children can have fresh air and sunshine."

I continued to wonder why factories move to the cities and drag us workmen from cozy homes and tempting gardens to high rents and cinder plots; and why we were denied the privilege of dwelling

out here amid the quiet farms, where homes are inexpensive and life is simple and bounteous. He divined my thoughts:

"You city fellows took our factory with two words, 'competition' and 'transportation.' The railway hauls the material right thru our little burg and delivers it to your city a hundred miles further on for less money than it will unload here; same way with every pound the factory sold. We begged, we bluffed, but do what we might, we didn't get the rates, and it was up to the factory to go to the city or to go bankrupt. In either event the factory workmen are forced to the city, the women and children pack up the goods and follow where they pay two prices for poor grub and my apples and garden stuff rots because I'm too far from market."

"What a magnificent crop of apples!" said I, encouragingly. It was a source of sincere regret to me that the congested cities and the selfish corporations were discriminating against the old home town, depriving it of the factory and reducing the profits of my farmer friend. It imprest me as a mutual loss —his and mine. I hoped it did not signify financial embarrassment. Here was a farmer out of the rut, striving nobly to make his farm attractive and to gratify the advanced desires of Tillie and Jim. My sympathies wished him his apparent prosperous reward. I began to fear it was not so splendid as it seemed.

"No," Eugene pondered as he spoke; "the orchard might do worse. It has paid for the old farm."

"All—paid for—house and all?" I stammered. When I curbed my surprise I asked: "How much will you get for this crop?"

"Haven't sold it yet. We can't get together on the price. The buyers are trying to hold us farmers up, as usual. They're only offering me $14,000; but I won't take a copper less than $15,000," as his fist pounded the steering wheel.

"Fifteen thousand dollars!" I exclaimed, as my own poverty, my insignificant savings, flashed into mind; that $150 a month salary, along with my city pride, began shrinking like gay flannels in Aunty Dinah's wooden tub. My astonishment was evident, for he began rather apologetically:

"Not all clean profit, mind you. Costs me about $6,000 this year for spraying, packing and other expenses. Barrels are infernally high just now. After all, the frau and I will spend the winter in California, Tillie and Jim will take a little vacation in New York during the theatrical season; there'll be some left for a drizzly spell. Then Jim wants a farm of his own and we'll have to give him a lift before long."

I took frequent walks in that eighty acres of golden orchard laden with juicy dividends. Its bounteous prospects accompanied me as we scorched down the hills and bumped over the bridges, when we feasted and jested with warm-hearted friends, and when I was alone in the silent night. The more I thought of that magnificent orchard the more I wondered how the boy at the foot of the class had so far surpassed me in the race of life.

Regretfully, altho refreshed, I retraced my flight from the farm back to the disillusioned factory job and to the narrow flat at forty a month. I came for conquest; I returned conquered. There's a sting in my memory when I recall the comfortable home and the happy farm of Eugene Hall. Something has cheated me. Was it the joyless boyhood days deprived of the invigorating amusements of progressive rural life? Was it the favoritism of rates which drove the factory and me from the orchards and the gardens and the wide acres into the cruel congestion of the cold-pulsing city? Was it the green-shuttered house on the hill that neglected to teach me that the silent possibilities of the fragrant apple blossom are superior to the thump and tooting of the city's brass band?

Lucy and I were again resting on the back porch in the stuffy twilight. I had just finished another eulogy of "Fat Acres," so named by Tillie and Jim.

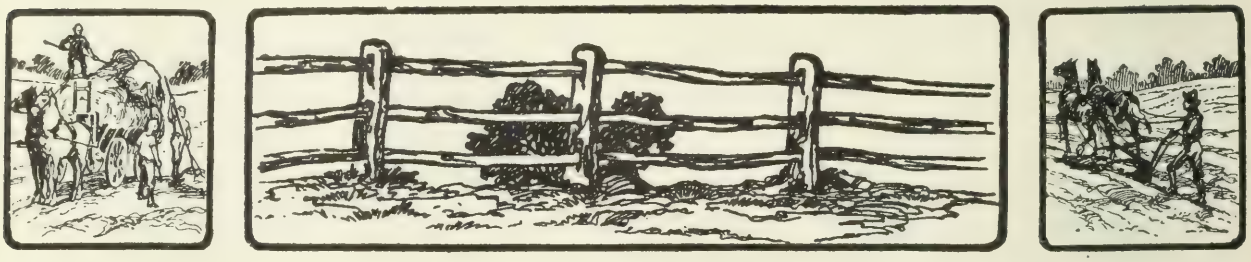
"Lucy," I asked as I knocked out the ashes from my meerschaum, "why do folks leave the fat-acred farms?"

"Because," she paused and slowly fanned with the evening paper, "because they overlook the fat; they see only the bony acres."

"You're right, Lucy; it's taken me

twenty-five years to see the fat side of the farm."

"Are you thinking," she inquired, as she stopped her sewing rocker, "of going back to the farm?"



"I am thinking,—yes; but like the old school I attended, I'm not doing. I have lost ambition, lost initiative, lost strength and health, lost the required years. Gene Hall is a free man, strong, independent, owns his home; I'm but a machine,—only a part,—merely a lever in the city's grind and clatter."

"You've done quite well, my dear; it might be much worse," Lucy consoled with an approving clasp of my arm.

"If I had only seen my chance as Gene Hall saw it, life would be different now."

And then we sat in the silence; not in the sweetness of country quietude, but in the dismal monotony of unceasing pavement patter, the splitting screech of motor and trolley, the distant rumble of train and factory,—a city's discord.

New York City.

The British Insurance Act

BY SYDNEY BROOKS

THE National Insurance Act is by far the most thorogoing measure of social reform that has ever reached the British statute book. One might even go further. It is probably the most daring and complicated scheme of national betterment ever proposed and carried in a single Parliament. Introduced on May 4, it received the royal assent on December 16, and will come into operation on July 15 of the present year. Its passage was in many, but not in all, ways, an extraordinary personal triumph for Mr. Lloyd George. The bill was his conception, and on his shoulders fell almost the whole burden of defending and explaining it before Parliament and the country. But he brought it forward without sufficient preliminary consultation with the innumerable and very powerful interests it was bound to affect. Directly its details came to be expounded formidable opposition developed in quarters where apparently he had looked for a sympathetic support; for weeks and even months on end the Chancellor of the Exchequer was doing little but receiving deputations, listening to complaints, promising the removal of grievances; he hardly ever spoke in the House without having some fresh amendment to propose; and the intricate and highly technical character of the bill, and the fact that, in order to get it passed by Christmas, debate had to be forcibly restricted (with the consequence that some hundreds of amendments were adopted without discussion), have resulted in the country at large having only a very general idea of what has actually been accomplished. I doubt whether there are more than a dozen men in Great Britain at this moment who could score 75 out of a possible 100 marks in an examination paper on the provisions of the act. The average man, befogged to begin with by the revolting complexities of the whole project, has found it frankly impossible to keep up with its manifold transformations; and people generally have a feeling that something big and fine and disagreeable has happened without quite knowing what. The *Daily Mail* for the past week has been publish-

ing a daily article which designed to show that all the benefits promised by the act are illusory. The *Daily Chronicle* has replied to its contentions point by point, hoping to prove that the benefits are valid, actuarially sound, and will indubitably be forthcoming. And this hopeless divergence of opinion is not to be ascribed solely or even mainly to the distortions of political partisanship. It pretty accurately reproduces the chaos of mutual contradictions in which any two ordinary persons quickly find themselves involved when they begin discussing the provisions of the act. Most people sympathize with what they understand to be the general aim and principle of the measure; they will agree that there ought to be a scheme of national insurance against sickness and unemployment, and that compulsory contributions are the only possible basis on which it can be worked; but the certainty that they will very soon be called upon to pay out a weekly sum of money fails to move them to gladness. The act, I should say, is widely and decidedly unpopular, and seems likely to tell heavily against the fortunes of the Government. Many of the interests antagonized by its provisions are still unreconciled—the doctors especially vow that, unless their claims are given further consideration, they will decline to work the act at all; passive resistance movements are being organized against this feature and against that; and it is clear that the Insurance Commissioners, for all the latitude allowed them, will have a hard task in resolving ambiguities, conciliating opposition, and giving the measure a decent administrative start.

The objects of the act are twofold—(1) to provide for insurance against loss of health and for the prevention and cure of sickness, and (2) to provide for insurance against unemployment. It is founded on three main principles—(a) the principle of compulsion wherever compulsion is possible, (b) the principle of admitting within one year all persons between sixteen and sixty-five at a uniform rate of premium, and, generally speaking, with equal benefits, and (c) the principle of working the act mainly thru existing friendly societies, trade unions and other provident associations, of releasing the reserves at present held by these societies against current risks, and thus of allowing those who in the past have voluntarily insured themselves against sickness or unemployment to reap an immediate advantage. The act makes it obligatory for all persons of between sixteen and sixty-five to insure who are under contract of service, whether paid by the hour, day, week, month or year, and whose earnings are less than $800 a year. This practically covers the whole range of industrial employment—artisans, mechanics, miners, clerks, shop assistants, domestic servants, sailors in the mercantile marine, unpensionable employees of local authorities or railway companies, outworkers (with certain exceptions), golf caddies, etc., etc.—to the number, it is estimated, of some 13,000,000 men and women. Among those who are not required to insure are (1) persons (other than manual laborers) receiving more than $800 a year as salary, (2) pensionable servants of the Crown or of local authorities and clerks of railway companies, (3) pensionable public school teachers, and (4) persons working on their own account, such as baggage carriers, washerwomen and seamstresses. In the case of soldiers and of sailors in the Royal navy there are special arrangements. All who are qualified to insure, but who for one reason or another do not, or cannot, insure in an "approved society"—a term which roughly covers the existing friendly societies, trade unions, provident societies, sick clubs and dividing societies—will be obliged to do so thru the post office. The reason for this is that the State, in compelling these people to insure, is compelling them to go to the friendly and kindred societies if they want the greatest returns for the premiums they are contributing, but it is not compelling the friendly societies to receive them. If they are manifestly unhealthy the societies will naturally reject them and the State will then either have to exclude from all participation in the act a class to whom its benefits would be particularly welcome or arrange some other scheme for them on its own initiative. It has chosen the latter alternative; and all people who are rejected by

the friendly societies—to the number, it is estimated, of 800,000—will be obliged to insure through the post office and to put up with inferior benefits. Altogether the compulsory class will thus include some 14,000,000 people.

But there are many thousands of men and women whose income does not exceed $800 and who yet are not "employed" persons within the meaning of the act. They are people working on their own account and not in the service of another. There are also many thousands who have been employed, who have insured themselves in a friendly society or trade union for five years or more, and who have then left their employment and set up for themselves. There are supposed to be over 2,000,000 people in these two categories, and the act allows them to come within the scope of its benefits as "voluntary contributors," provided they are willing to pay out of their own pockets the weekly contribution which, in the case of employed persons, is paid by the employer. It is not expected that all the members of these two classes will take advantage of the act, but somewhere between a half and a third probably will. The total anticipated beneficiaries of the act will therefore number 15,000,000.

The insurance fund will be made up of contributions by (a) the worker, (b) the employer, and (c) the State. The employer must pay the contribution of each of his insured workers, as well as his own contribution due in respect of them, and will repay himself by deducting the amount of each worker's contribution from his or her wages. The method of payment, as in Germany, is to be by stamps affixt to a card; and the weekly contributions are made up as follows:

	Wages not exceeding 36 cents a day. Cents.	Wages not exceeding 48 cents a day. Cents.	Wages not exceeding 60 cents a day. Cents.	Wages exceeding 60 cents a day. Cents.
Weekly payment by employer:				
For workman	12	10	8	6
For workwoman	10	8	6	6
Weekly payment by workman or woman	0	2	6	8 for men 6 for women
Addition per week by State, the equivalent of	6	6	4	4
Total payments per week	18 for men 16 for women	18 for men 16 for women	18 for men 16 for women	18 for men 16 for women

The benefits to be received by insured persons from the funds thus provided are (1) free medical treatment and attendance thruout life, including the provision of proper and sufficient medicines; (2) a sickness benefit, payable from the fourth day of the illness, and continuing if necessary for twenty-six weeks at the rate of $2.50 per week for men and $1.90 per week for women, to be followed, if the sickness still continues, by a disablement benefit of $1.25 a week; (3) free treatment in a sanatorium for the insured person and (if the insurance committee so decide) for his wife and children when suffering from consumption—the act makes a special grant of $7,500,000 toward the erection of sanatoria and other institutions for the treatment of tuberculosis, and another annual grant of 2 cents a head for each insured person, and takes 30 cents a head from the benefit funds for the purpose of a national campaign against "the white man's plague"; and (4) a maternity benefit of $6 payable from the father's insurance, or from the mother's if she is insured. There are also reduced rates with correspondingly reduced benefits for men and women, if unmarried and with no dependents, between the ages of sixteen and twenty and for persons over fifty years old on entry; and among the additional benefits that will be available if the finances permit are free medical attendance for dependents, free dental treatment, convalescent allowances, increase of the maternity benefit, and increase of the existing old age pensions or old age pensions at an earlier age than seventy.

The actuaries estimate the capitalized value of the reserves which must be provided to carry out the act at $335,000,000; they expect the total contributions from employers and insured persons to rise from some $65,000,000 in 1912-13 to nearly $120,000,000 in 1932-33, and the State contributions to increase from $7,300,000 for the current year to some $31,000,000 twenty years hence; and they

reckon the annual expenditure in benefits and in cost of administration at $27,000,000 to begin with, rising to over $125,000,000 in 1932-33. To exterminate the debt of $335,000,000 the commissioners will retain out of the weekly contribution of a member of an approved society the sum of 3 1-9 cents in the case of a man and 3 cents in the case of a woman. If their calculations are right a surplus of about 6 per cent. over and above the cost of the benefits will be provided by the weekly contributions of employers and insured persons, and the debt of $335,000,000 will be extinguished by the end of eighteen and a quarter years. This implies, of course, that eighteen and a quarter years must elapse before the benefits really procurable by the premiums can be enjoyed in full—a point which to some extent justifies the charge that the whole insurance scheme is being carried thru at the expense of the young. It should also be stated that no sick benefit is payable until six months after entry into insurance and no disablement benefit until two years after entry; that both benefits may be reduced if, in a given case, they exceed two-thirds of the usual wages earned by the insured; and that medical, sanatorium and maternity benefits will be suspended altogether if the insured is in arrears to an amount greater than twenty-six contributions a year on the average, and sickness benefit suspended if more than thirteen contributions a year are in arrears. The fund is to be administered by a body of insurance commissioners who are armed with very large powers and who will work in conjunction with an advisory committee representing associations of employers, of approved societies and of medical practitioners. Under them insurance committees will be set up in every county and county borough, with a minimum of forty and a maximum of eighty members representing all the local interests involved, charged with the duty of administering medical benefit, of controlling the sanatorium fund, of administering the benefits of the post office class, and of getting together all the available information as to the health and sanitary conditions of their districts. Below them, again, will be district committees working smaller areas in greater detail and in co-operation with the local branches of the approved societies thru which the sickness, disablement, maternity and "additional" benefits are in the main to be distributed. Mr. Lloyd George expects from the activities of these county and district committees some invaluable results in the shape of uniform and comprehensive reports on the health of 15,000,000 of working-class households.

So much for Part I of the act, or so much, rather, for a bare, crude outline of what Part I contains. Part II is taken up with a scheme of compulsory insurance against unemployment in the following seven trades—building, construction of works, ship-building, mechanical engineering, iron-founding, construction of vehicles, saw-milling. The Board of Trade, which will administer this part of the act, has power to include other trades in the scheme, but for the present it will be confined to the seven I have mentioned. It is estimated that some 2,400,000 work people of eighteen and upward will come within its provisions at the outset. The unemployment insurance fund will be raised by weekly contributions from employer and employee of 5 cents each for each period of a week or less; but where the period of employment is two days or less the contributions of workman and employer are 2 cents a day each. In order to discourage irregular employment it is provided that an employer who has employed a man continuously thruout a period of twelve months may recover one-third of his own contributions paid for that man. The state contribution to the fund will be one-third of the total contributions from workmen and employers. No contribution is required while the workman is unemployed for any cause. The benefits provided consist of weekly payments to the workmen while unemployed of $1.75 a week up to a maximum of fifteen weeks in any twelve months. No benefit will be paid for the first week of any period of unemployment and not more than one week of benefit can be drawn by any man for every five weekly contributions paid by him. A workman will receive this benefit only if he (a) has been employed in

an insured trade for twenty-six weeks during the preceding five years, (b) has made proper application for the benefit and has been continuously unemployed since his application, (c) is capable of work and unable to get it, and (d) has not exhausted his right to benefit. Even if he has fulfilled these conditions a workman will not receive benefit if he has lost employment thru a strike or lockout or thru misconduct, or has voluntarily thrown up his job without just cause, or is in receipt of sickness benefit. The scheme is to be worked principally thru the labor exchanges.

I have now, I hope, written enough to give a general idea of this amazing act. If I were to go into details and were to discuss the various exemptions and qualifications, the position of the doctors under the act, the position of married women, the position of the post office contributors, the position of the friendly societies and the trade unions which are now brought under quasi-Governmental supervision, the furious indignation of householders over the inclusion of domestic servants, the methods of changing from the compulsory class to the voluntary and vice versa, and if I were to compare—or, rather, since no real comparison is possible—to contrast the British and the German schemes, this article would expand into a volume. But it must be obvious, even from the meager description I have given of the act, that there is hardly a home, or a factory, or workshop, or a public institution in the kingdom in which its effects will not be felt. It must powerfully influence the administration of the poor law and in the course of time it may even end by superseding the boards of guardians or by amalgamating them with the district committees. It revolutionizes the whole status of the friendly societies and of the trade unions by bringing them into state control and state interference with the benevolent and insurance branches of their work. It goes a long way toward making the medical profession a public profession and toward throwing all hospitals and infirmaries on the public funds. For the first time in the history of modern England it applies financial compulsion to the poorest, or nearly the poorest, of the poor. It initiates one great campaign against tuberculosis and another against unemployment. It embodies high aims; it provides substantial benefits. But it remains to be seen whether its aims and benefits can be realized without a permanent depression of the wages of that very section of the community for whose well being it was enacted. The poor pay for most things and always for "social reform."

LONDON, ENGLAND.

Changing China

BY WILLIAM WIRT LOCKWOOD

GENERAL SECRETARY OF THE Y. M. C. A. OF SHANGHAI.

FEBRUARY 12, 1912—the birthday of the immortal Lincoln—is a date that will stand out as prominently in history of the Orient as July 4, 1776, does in the Occident. The date is the birthday of the United States of China, when an oppressive foreign Manchu dynasty which has held sway over the Empire for two hundred and seventy-eight years stepped down and out and declared that in obedience to the exprest "will of the people" they gave up the throne to make way for the new republic.

The Manchus were too late in discerning the signs of the time. Up until 1900 the old régime withstood with all its power every line of progress. The history of China during the Manchu rule has been filled with unfortunate episodes that have resulted from their determination to maintain an isolation impossible for nations in these later days. The history of the foreign relations of the Empire during this whole period is the story of a continuous struggle that the Chinese officials have made to keep China a hermit kingdom. War after war has

been fought with this as its purpose and step by step China—not a warlike nation during these centuries—has lost dependency after dependency to those outside "barbarian" peoples who have insisted by friendly means when possible, but by force when necessary, upon securing for China diplomatic and trade relations with the outside world. Thru these wars the Empire has lost Indo-China, Burmah, Annam, Hong-kong, Formosa, Korea, a part of the Liaotung Peninsula and now at this time Manchuria, Mongolia and Tibet are about to slip from the grasp of the once warlike virile giant of the Orient, who, just now waking from his long sleep, is rubbing his eyes and preparing to rise in strength to claim his own.

From this time forward we predict we will hear no more about "spheres of influence" as applied to China. This nation has awaked, but none too soon, to save itself from those foreign depredators who, under the guise of trade and diplomacy, have pushed their outposts into the extremities of the earth and grasped territory without right or conscience or limit except such as was imposed by the fear that others might object.

The history of China's dealing with foreign powers does not shed great luster upon so-called Christian nations of Europe if viewed from the standpoint of the Chinese patriot. During the past ten years we have seen a good deal in American publications about the "yellow peril" and "antiforeignism" in China, but residence in China makes a fair-minded person fear more the "white peril." In most cases what is called "antiforeignism," as viewed by the nations abroad, is that "antiforeignism" (better pronounced "patriotism") that has built up and made America and other nations of the West the great nations that they are today. One cannot deny that this patriotism of China has sometimes been misguided, but is this not also true in many instances in the West?

As Americans we count it a matter of pride that the piratical "big stick" policy has not been wielded by us in Asia. America as a nation has made a creditable record in the Orient in the matter of international relationships. From the days of Caleb Cushing, the first Minister to China, up to the present the United States has adhered to a policy of "disinterested benevolence." Only a few times, one quite recently, has "big business" made demands upon China, backed up by consular and diplomatic representatives. The policy of goodwill which has been followed has never been more ably enunciated than by President, then Secretary, Taft, upon the occasion of his last visit to Shanghai five years ago.

One sees today the result of this policy of America as regards China. We see young China patterning the new government largely after the American model. America, more than any other country, is educating the leaders of the new China. The colleges of America have been chosen as the training ground of the leadership of the new China. One cannot fully estimate the important bearing of these two facts upon the future commercial expansion of America in the Orient. The United States, taken as a model for government, will also be taken as a model in other lines of development and American goods will naturally find an increasing market in this country. Train Chinese young men in American colleges how to build railways and you will likely see their training reproduced in railways built after the American model in China. Train Chinese leaders in agriculture in America and you will likely see in future years American methods and machinery adapted to use in China. Therefore America's policy of goodwill toward China is bearing and will continue to bear fruitage in a relationship that will be mutually beneficial commercially as well as diplomatically in the years to come.

"Is the republican form of government suited to the Chinese?" This question we see has been debated *pro* and *con* in American and English newspapers. We are not surprised to see that the question has been quite generally decided in the negative by Western editors. China, however, is not a country where despotism has flourished. Ruler after ruler has been deposed because of his encroachments upon the liberties of the people. The people have always

been an important element in the body politic. The great philosopher Mencius (372-289 B. C.,), second only to Confucius in his influence over China, speaking of government accorded the people first place, the gods second place, and the sovereign third in the scale of national importance; and this classification has been indelibly imprest upon the Chinese during the past twenty-two centuries. Professor Giles, of Cambridge, in an interesting little volume called "Civilization of China," recently published, says that the institutions of China are "autocratic in form, but democratic in operation." He examples the matter of taxation and says:

"The traditional and well-marked lines of taxation are freely accepted by the people; any attempt, however, to increase the amounts to be levied or introduce new charges of any kind, unless duly authorized by the people themselves, would be at once sternly resisted. As a matter of fact, the authorities never run any such risks. It is customary, when absolutely necessary, and possibly desirable, to increase old or to introduce new levies, for the local authorities to invite the leading merchants and others concerned to a private conference, and only when there is a general consent of all parties do the officials venture to put forth proclamations saying that such and such a tax will be increased or imposed, as the case may be. Any other method may lead to disastrous results. The people refuse to pay; the coercion is met at once by a general closing of shops and stoppage of trade, or, in more serious cases, by an attack on the official residence of the offending mandarin, who sees his house looted and leveled to the ground. In other words, the Chinese people tax themselves."

Another indication of democracy in China is the place accorded to education as compared with family and rank. Just as in the United States any boy is a potential president of the nation, so the civil service of China, existing practically without change for twenty centuries up to five years ago, made it possible for any boy to become the prime minister. Chinese history is filled with examples where sons of humble parentage have risen thru their abilities to places of large responsibility in the provincial and central governments.

Still another evidence of the democracy is the village government, where matters are in the hands of the head men or elders, who are selected and removed at the will of the people. As the town meeting in New England was the germ of American local democratic government, so in China we see in this village organization the same for Chinese democracy. This village elder is the father of his people, and he serves as the adjuster of difficulties between individuals, families and clans. The author already quoted gives an example of the responsibility borne by these representatives of the people:

"Supposing a traveler, passing thru an English village, to be hit on the head with a stone. Unless he can point out the assailant, the matter is at an end. In China, all the injured party has to do is to point out the village—or, if a town, the ward—in which he was assaulted. Then the head man of such town or ward is summoned before the authorities and fined proportionately to the offense, for allowing rowdy behavior in his district. The head man takes good care that he does not pay the fine himself. In the same way parents are held responsible for the acts of their children, and householders for their servants."

In view of these and many other like facts which typify the spirit of the Chinese people, it requires considerable presumption for us Americans to maintain that China cannot be a republic.

Thruout the whole present situation there has been one great power in the North, and he has revealed his influence over the Chinese people in such a way as to characterize him as one of the greatest leaders of history, and Yuan Shi-kai is the man of the hour.

"Mr. Yuan," as he is now called under the new republic, has had a romantic history. His early days were spent in the army, where he rose rapidly because of his natural ability as a military leader. He came into particular prominence in the *coup d'état* of 1898, when the Empress Dowager took back the government from the Emperor after he had ruled but a short time. During the rule of the young Emperor the court became the rendezvous of a group of radical reformers, who proposed to change China to a modern basis in a few months' time. Following the Boxer trouble of 1900 Yuan was closely connected with the Empress, who, by a remarkable turn of mind, accepted the inevitable and became an ardent reformer. While those reforms which the Emperor attempted during his short period of rule previous

to his retirement were brought to an abrupt end by the Empress and his advisers were either beheaded or compelled to flee the country, yet from 1900 the Empress Dowager, at more than sixty years of age, set herself to bring about these same reforms by a slower process. No nation in history moved more rapidly than China between that and the time of her death eight years later. Imperial deputations were sent abroad to study the institutions of the West, and after thoro study to report on what adaptations should be made for China to take her proper place among modern nations. Students in large numbers were sent to Japan, America and Europe. Soon after the Japan-Russia war in Tokyo alone there were 15,000 Chinese students.

The reforms introduced in China dealt with the army, which was modernized and officered by trained military men from Japan. The system of education and examination was completely changed and a system substituted which involved replacing the antiquated, the impractical, the literary, with the modern, the utilitarian and the scientific. The old examination halls, empty except for the one month in three years, when used for the conduct of examinations, were replaced with live modern schools and colleges which throbbed with new life. The old Confucian classics were superseded by books of the new learning. The system of binding the feet was condemned by imperial edict. Determined effort under imperial orders made headway with the anti-opium crusade. A scheme was adopted to reform the coinage and put it on a proper basis. Before the death of the late Empress an edict declared for the reformation in the government which involved within ten years the establishment of provincial assemblies and a national parliament which would voice the will of the people and constitute a check upon the throne. The Empress Dowager during her latter days marked out the way for the future. But the forward movement was too rapid. The people, seeing their power, began to assert themselves. The new schools became training ground for the new democracy. The provincial assemblies as soon as organized demanded certain powers for themselves; the provisional senate asked for further immediate concessions from the throne, and the end was revolution.

Yuan Shi-kai was in great favor with the Empress during these days of reform. He had much to do with the reform of the army. In modern education he put the northern province of Chihli, where he served as viceroy, in the forefront of all others. An educational system was worked out in this province whereby each township was to have a primary and graded school, each county a high school and the university and professional schools were organized at the vice-regal headquarters, Tientsin. Normal schools were established for training teachers, military colleges for the officers of the army; a law college for the prospective leaders in political life; a medical college for training doctors. Tientsin became the Athens of China. Yuan instituted a new system of police thruout the province. The Tientsin city government was reorganized, the old city wall was torn down and an electric tramway built in its place; a waste section of land near the city was reclaimed and built upon it was a new city with wide streets, handsome foreign buildings, electric lights and waterworks. It was Yuan Shi-kai, who worked out as viceroy in Chihli Province, the reform that the throne intended for the empire.

Yuan's most marked ability is his knowledge of men and how to use them. Tho not a man of modern education, yet he called to his side men from abroad who had modern education, and these men did the necessary work. Tho not a modern soldier, trained in the tactics of war, he secured from abroad those who soon brought the northern army to a high state of efficiency. Not knowing a great deal about foreign law or medicine he called to his side experts in these lines and gave them opportunity to use their knowledge in a practical way. Yuan, like all great statesmen, has been able to use other men's abilities, and his success thruout has been due to this talent, which he seems to possess in an unusual degree.

The statesman's career, however, suffered an eclipse with the death of the

Empress Dowager. With her death the brother of the late Emperor was elected Regent, and within a few weeks Yuan, because as head of the army he was said to have assisted the Empress in regaining the throne, was now stript of his ranks, deprived of his offices, and sent into official disgrace. At this time he retired to his home in Honan Province, on the plea of a sore foot, and for two years, until the outbreak of the present revolution, he refused to budge from his native place, remaining there apparently forgotten by the outside world.

With the outbreak of the revolution at Wuchang Yuan was invited to join the Republicans. Messengers were sent to him by General Li after the first success against the Imperialists, and the ally of the Manchu Dowager Empress was offered the presidency of the new republic. Yuan did not reply for some weeks. He let the time pass without giving the Republicans encouragement, and they pushed the campaign independently. Province after province fell into their grasp, and before an armistice was declared two-thirds of China proper went over to the revolutionists, in most cases without bloodshed. Meanwhile Yuan remained silently in retirement.

The republican government was organized at Nanking, and troops were enrolled by the tens of thousands and preparations were made to push the campaign against the northern provinces.

At Peking the condition had become chaotic. The Prince Regent and his advisers had no united policy and were unable to keep the situation in hand. A strong hand with an iron will was needed at the helm and no one emerged to assume the leadership. No sadder comment can be made upon the Manchu régime than that, among all those around the throne in the capital city, not a great leader emerged when the crisis came. The people of the capital city were frightened beyond measure at the threats that came from the south. Half the population of Peking, including many of the leading officials, had left the capital city for Tientsin and other places of safety.

There was a large army of defense, but no one knew whether they were loyal or not. Many who had gone south to fight the revolutionists had turned over to the revolutionists. In desperation the Manchu leaders, forgetting "face" entirely, turned to Yuan and on their knees begged him to return to the capital city and take the helm of state. Yuan continued for some days to play a waiting game and days and days elapsed during which the situation in the north grew steadily worse. This wait continued until Yuan was able to dictate his own terms and probably arrange details with his lieutenants, and then he answered the summons, returned to Peking to save the situation. An armistice was arranged with the revolutionists, which was renewed time and again until the abdication and resultant peace.

With Yuan's return to Peking the situation changed completely. A strong hand was at the helm and people recognized this fact, as was shown by the fact that thousands of Chinese and Manchus returned to the city. One of the strong assets of Yuan was the loyalty of the northern army. No greater tribute can be paid to the man than that this army, from which he had been separated for from three to five years, remained true to him and were ready to fight, if need be, at his orders.

Yuan despatched one of his most trusted lieutenants, Tong Hyao-yi, a returned student from America, to Shanghai to arrange terms with the Republicans. Negotiations continued in the peace conference for some days back and forth. No one know what to expect. Meanwhile Yuan had on hand difficult negotiations at Peking with the imperial family. The Republicans demanded the abdication of the Ching Emperor and nothing less would satisfy. The leader's consummate skill was shown not so much by his dealings with the Republicans as by his dealings with the Manchus, some of whom took strong stand against retirement. Day after day elapsed, without result as far as the outside world could discern. During this time the great dictator, for such he was, occupied a dangerous middle position. His life was attempted on one occasion and he was recognized to be in constant danger. The Republicans hated him because they felt he had iden-

tified himself with the Manchus as against the Chinese. The Manchus suspected him because they felt he was trying to force their abdication. Fortunately the many threats made against his life did not materialize and he worked diligently to bring the two parties together and secure terms of peace. No one but a skilled Oriental could have escaped with his life. Funds were at low ebb in the north. The rich provinces of the south had ceased to send tribute to the north. The customs and postal revenues at Shanghai were being deposited in a special fund to await the issue of the struggle. The Republicans of the south made it clear that a loan of money to the Peking Government would constitute a breach of neutrality, and nations and syndicates with plenty of ready cash, which they were anxious to lend, did not dare to float a loan. The princes were besought to open up their treasure boxes and contribute to the war, but they did not respond in sufficient amount to underwrite the large expense of civil warfare. Meanwhile the southern Republicans seemed to have plenty of money and each week during the armistice were enrolling soldiers, purchasing supplies and fitting out expeditions for the north. There were reports of a Republican movement in Manchuria. Russia was reporting trouble in outer Mongolia, where native tribes were said to be in revolt.

It seemed at one time after the peace terms had been fixt by the accredited delegate to the Shanghai Peace Conference that it was uncertain whether Yuan would be able to secure the abdication of the Manchus. While the older and more influential were willing to step aside, a younger, hot-blooded set were for standing pat. But Yuan waited and worked and worked and waited, and while details have not and will not be published soon, yet in the end his persistence secured the result, and on February 12 an edict was published announcing the last of the temporal power of the Manchus and appointing Yuan Shi-kai as the temporary president of the new republic, pending the calling of an elective body to settle upon the details of a permanent government.

During this period in Central China the provinces had elected as provisional president Dr. Sun Yat-sen, a man of a remarkable history, who has been for the past twenty years, most of which time an exile from his home land, giving his life to the cause of reforming China's Government. Dr. Sun has, during his régime, created a favorable impression. He worked quietly but effectively in a difficult situation. With him has been a cabinet and a Provincial Assembly, or Senate, who have been doing much preliminary work to discussing the plans for the new constitution. This Provisional Senate has been made up largely of men who have studied abroad. Among them are some of the best young men who have graduated from colleges in Japan, England and America. The head of foreign affairs, for example, is a Ph. D. from Yale, and the presiding officer of the Senate for some time was a student of Columbia. They were young men with high ideals and ambitions to see China take its proper place as a nation among nations.

Upon the issuance of the edict of abdication President Sun resigned his position and recommended the election of Yuan Shi-kai as temporary President, a recommendation that was accepted, closed the war, and made it possible to begin at once the settlement of the question of a permanent government.

Important issues now await settlement, as in every country where a new government is formed. For one thing, a constitution is to be settled upon, one which will settle the form of republic. It is not probable that any Western constitution will be found suitable. It is likely that the China constitution will contain some of the peculiar elements of the constitutions of the United States, France and Switzerland. One of the difficult decisions will be as to the electorate, as to what limits will be placed upon the franchise. It is likely that the leaders will see the need of considerable limitation at first, followed by the gradual extension as the people become educated and schooled in the principles of republican government. The relations of the provinces to each other and of the provinces to the central Government will without doubt constitute a

bone of contention. Even under the Imperial régime there has been constant friction on this matter. The subject of taxation is another difficult question. The Chinese have never enjoyed direct taxation, and this has been the cause of more rebellions than anything else. One does not wonder why the Chinese resist taxation when he sees how little the recent government has given in return. The whole theory seems to have been that the government existed for the governing class. It has been government by the officials for the officials. If roads were to be repaired, bridges to be rebuilt or protection to be afforded from lawless elements the local or provincial or private arrangements were in large measure depended upon to do this unaided from Peking. There have been few visible returns from imperial government, and it is not to be wondered that the people have resisted taxation. The new government will have a difficult task to raise revenue by direct taxation. As to the tariff, by treaties made with foreign Powers, China is bound hand and foot to a customs duty on imports running between five and fifteen per cent., a ridiculously low rate, and only by the revision of these treaties can the duties be raised. The foreign governments should certainly see to it that China is assisted in the matter of allowing a raising of the tariff.

Wherever one looks there are large outstanding difficulties before the Republic of China, but this has ever been so with nations, and if a long view is taken we have no doubt that China will be seen to be as wise in these things as the nations of the West. China has the advantage of the experience of all the other nations to guide her in fixing the course for the future, and we have no doubt has also the men of perseverance, honesty and patriotism to astonish the world in the next decade in the rapidity of substantial development as during the decade just passed.

SHANGHAI, CHINA.

The Manufacturer and the Tariff

BY CLINTON ALVORD

PRESIDENT OF THE WORCESTER LOOM COMPANY.

CONGRESSMAN OSCAR W. UNDERWOOD presented his side of the "Right and Wrong of the Tariff Question" in your issue of February 1, and on March 7 you printed an article by Mr. John Martin on substantially the same idea. They criticised very sharply the ideals, plans and business conduct of a most excellent class of Americans. These men have done splendidly in times past for their employees; and will continue to develop and assist the manual skill, mental growth and character of the people in their mills. It is by their foresight and business acumen that large numbers of workingmen have been enabled to earn wages and comforts far in excess of anything to which they had heretofore been accustomed. Men who do this sort of thing should be looked upon as benefactors, for such they are in the very broadest sense. Mr. Martin, however, has thoroughly condemned them, and urged that they be socially ostracized. Any one of the manufacturers in Lawrence, whom he so thoroly condemns, does far more for humanity than a person on a salary.

Congressman Underwood says:

"I have never been able to see why the great manufacturer should have his profits protected any more than the farmer or the grocer or the lawyer."

The writer believes that Mr. Underwood is a lawyer, certainly he is a United States Congressman, and when on either or both of these jobs he is working under a prohibitive protection. A man in England cannot be a United States Congressman. No client can employ a lawyer in either England or Germany for a case in our courts, therefore

all lawyers are protected in the pursuit of the profits of their profession by a prohibitive protection. No English grocer in Manchester, with his low priced help and cheap rent, can undersell one in New York City. American housewives must purchase from American grocers. Our farmers likewise labor under a prohibitive protection on most of their perishable products by virtue of the location of their farms. Besides this, they really have a tariff protection on many things, for instance, the $700,000 paid as duty on imported potatoes during the past few weeks. It is evident that Mr. Underwood is absolutely wrong and that the profits of the lawyer and grocer are better protected than those of the manufacturer. He misses the whole spirit of the protective tariff, and yet he is the leading critic of the Democrats. Every point in his article is based on similar false conceptions.

A weaver in Lawrence has simply a tariff wall between his wages and the cheap labor of England and the Continent. Identical fabrics are constantly coming in from England over this wall, and it is evident that the Lawrence manufacturer, in whose employ the workman is, cannot sell for any higher price than is paid for similar English goods in this country. Any attempt to push his compensation up over a certain figure forces the cost of the cloth so high that it cannot find a market, and if the manufacturer misses his sales, then the workman loses his job.

Mr. Martin says:

"Truly anybody who has seen the underfed, ill-clad, stunted masses in Lawrence must laugh aloud at the argument that a high tariff protects labor in America against pauper labor in Europe. The paupers have been imported, and today pauper rates are turning Americans out of the mills."

Now, the American Woolen Mill officials testified in Washington a few weeks ago that the average wage for men, women and children in their mill at Lawrence was over $9 per week, and does Mr. Martin claim that to be the standard European pauper wage for adults and children? Other trained investigators with as good eyes failed to find Mr. Martin's underfed, ill-clad, stunted masses in Lawrence, and he evidently wrote that for effect; he wanted to find such, so he wrote that he had in an endeavor to produce a more sensational article.

The British Board of Trade recently prepared some figures showing the weekly wages paid to English textile operatives, and the following comparison of the same with the American average wages for the same tasks on the same style of machines and for an equal amount of product is surprising to criticisers of our protective tariff. The figures are as follows:

Men.	English.	American.
Worsted weavers	$6.12	$12.36
Woolen weavers	6.21	10.63
Comb tenders	4.26	7.85
Wool sorters	7.22	12.38

Women.	English.	American.
Worsted weavers	$3.59	$9.55
Woolen weavers	3.85	10.54
Comb tenders	3.00	6.52
Worsted spinners	2.25	6.40

Congressman Underwood states that,

"The popular and telling argument which has so often been made in favor of prohibitive duties is that it protects American labor. But there is not a protected industry where the amount of protection afforded has not been far in excess of the difference between the cost of labor at home and abroad."

The facts prove this statement to be incorrect. The writer purchases certain machines in England, pays for the expensive packing, ocean insurance and freight, a duty of 45 per cent. on invoice and packing, adds a commission and sells them for less money than they can possibly be made for in this country. Quantities of English machinery is imported in this manner. The English manufacturer pays a metal planer hand 28 shillings per week, or $6.72, and such a workman is a highly skilled operative. They pay not over 34 shillings per week, or $8.16, to their best journeymen machinists of the toolmaker grade. We pay 72 shillings, of $18 per week, for a metal planer hand and the same or better to a highly skilled journeyman machinist. The tariff is 45 per cent., but we pay our workmen 150 per cent. higher than do our English competitors, or more than 2½ times as much, therefore cannot compete and are forced to import the machines.

The critics fail to grasp the idea that manufacturers are subject to home competition just as much as ministers and bricklayers. How simple must be the mind and thought of such a critic when he neglects to see that home competition will enter a field that is being served by a successful manufacturer. The doctor, the lawyer, the carpenter and the blacksmith have their daily stipend unaffected except by home competition, but the weaver of textiles or the machinist in a manufacturing plant can have his source of revenue cut off by a German in the same line in Berlin, or an Englishman in Birmingham.

The writer knows of a most efficient cotton mill in Lancashire, England, in direct competition with the much criticised mills at Lawrence. The most prominent director told the writer that during 1910 they made a profit of 24 per cent., and they made this profit while paying their operatives about one-half the weekly wage paid by the Pacific mills for identical tasks.

Is it not evident that this English mill could reduce the price of its goods by a decided margin and thereby undersell its American competitors? What hodcarrier, school teacher, newspaper compositor or stenographer in the United States is subject to any such severe and menacing form of low-priced foreign labor competition? Mr. Underwood says:

> "I am very far from being in favor of any course which will reduce the wages of the American workmen. In fact, I know that his condition will be improved by the reduction of the tariff to a competitive basis."

Now, where does Mr. Underwood think all the English goods sold in this country come from if they do not come in over the tariff wall on a competitive basis? If not competitive, then on what basis do they come?

The writer knows of a skilled overseer in an English textile mill, who has charge of eighty operatives. The owners of the mill feel glad that they have the services of so competent a foreman. In this country he would receive as much as $28 per week, whereas now in England he draws $9.60 per week. One assistant draws $6 per week and the other $7.20. The textiles upon which these men work as overseers are of a high grade and call for better wages than the ordinary run of English mills; the weavers do not, of course, receive as good wages. Therefore are we not justified in asking Mr. Underwood to show us how much duties can be reduced on textiles without cutting the wages of our corresponding American workmen. Why does he not show the costs and facts if he really knows them?

Mr. Martin proceeds to ask what can be done to help what he calls the pauper operatives at Lawrence, and says that he put the problem up to a prominent candidate for the presidency of the United States, and the reply was as follows:

> "Repeal Schedule K, deprive the woolen manufacturers of the high tariff which enables them to defy economic law by employing low-priced, inefficient labor. Make them compete with the world and they will soon be taught that high wages for competent workers are cheaper than low wages for incompetent."

Now, how is that for "a peach" of an academic statement? Our textile manufacturers pay thousands of dollars annually for accurate cost departments and therefore know the cheapest way of making a certain grade of goods. Is it probable that a lawyer or a college professor could know more about cheap production than the expert agents of our mills with the help of their efficient cost departments?

We have been expecting that the various strikes in Great Britain would increase wages and cause a higher selling price, with a resultant increased ad valorem duty on this side. The "prominent Presidential candidate" claims that this increase in the item of labor in England will not thus increase but instead will decrease this import cost. So one sees that our unfortunate manufacturers will be in a more pitiful state than ever, because the increase in the English wage will enable manufacturers over there to send their goods in here cheaper than ever. This is evidently the logic of his thought, but could one call it *thought?* His remarks would lead one to suppose that the cotton mill in Lancashire, England, that earned 24 per cent. in 1910 would have earned 34 per cent. if the manager had increased the pay of all the employees 10 per cent. on the first of January of that year.

Mr. Martin states:

"The paupers have been imported, and at pauper rates are driving Americans out of the mills."

Forty years ago it was said that the Irish were driving the Americans out of the mills, and twenty years ago that the French Canadians were replacing the Irish. Two years ago the writer heard it stated that no self-respecting French Canadian girl would work in a mill at Lawrence on account of the Poles and Italians who were employed there. Mr. Martin would have us understand that the Americans were driven out and *down*. The truth of the matter is that those who are supplanted are driven *up*. An illustration will show such results. My seven-year-old daughter went to school last fall to Miss Murphy; in February she was promoted to Miss McNamara's room, and Miss Boyle will receive her next year. Miss O'Connor teaches her writing, and calisthenics are under Miss Flynn. They are all good teachers. By actual count one-third of the lawyers in Worcester are Irish. Where, therefore, would one judge the Irish girls and boys had been driven to by the advent of the French Canadians?

There are many thousands of our workmen who, this coming fall, will vote for the success of the Democratic party, the political party that is trying to reduce the tariff wall that protects their wages. They will listen to and believe just such foolish statements as those quoted. It does not seem possible that an intelligent workingman can believe that the manufacturer in whose employ he is would raise his wages because the tariff on the finished goods the workman is making was lowered, but nevertheless many thousands will be led into just that fallacy. The closer such statements are analyzed the more ridiculous they seem.

Manufacturing plants are, on the average, conducted in an efficient manner; in fact, the sentimental Mr. Martin criticises them as speeding up their workmen to too rapid a pace. Efficiency is much talked of now, and it is understood to mean more product turned out at a less cost. All this impractical criticism appears to advocate the paying of higher wages for less work, which is in the wrong direction and opposed to efficiency. The present almost universal raising of wages, to counteract the high cost of living, means still higher cost of production and will add still further to the cost of living. Such solutions move in a circle. The gain in cheapness made by our efficient manufacturers is lost many times over by the very expensive method of distribution.

The Tariff Board has just reported to the President on the cost of manufacturing cotton fabrics and makes quite a point of this. It states that a certain cotton quilt was sold at the mill for 62.5 cents and retailed at the stores for $1. In 1910 the mill raised the price to 75 cents, which was an increase of only 12.5 cents, but the stores jumped the price to $1.50, or an increase of 50 cents.

A salesman recently came into my office and the bookkeeper purchased seven articles for 25 cents, or 3.5 cents each. The manufacturer did not sell direct but turned them over to the salesman at a price, and he added his commission, which we paid. A few days later these patented articles were priced by the same bookkeeper in a store where they retailed at 10 cents per piece, selling at retail for $1.20 per dozen. The producer made the article and made a profit at a manufacturing cost of something like 2.5 cents each (we assume the salesman added 1 cent), and the purchaser at retail is obliged to pay 10 cents, or four times the manufacturer's price. Increases in price of from 100 per cent. to 300 per cent. for mere distribution to the consumer are worse than inefficiency and can be termed wicked.

Why does not THE INDEPENDENT take the lead in criticising the very poor methods of present distribution and urge the adoption of cheap and practical means for getting the goods to the people. A successful campaign in this line would undoubtedly head off the present distressing trend toward Socialism.

WORCESTER, MASS.

Literature

The Recording Angel

INSTEAD of adopting the usual essay form in reviewing Mrs. L. H. Harris's latest novel* of Southern life, we print the following letters. The first is by one of the editors of THE INDEPENDENT to Mrs. Harris, and the second is her reply. Neither, of course, when written, was intended for publication but they give the point of view of both editor and author which is perhaps more to be desired than the editorial *ipse dixit* alone. Of course our readers are aware of the high esteem in which Mrs. Harris's writings are held in our office. Since the death of our literary editor, Maurice Thompson, in 1901, she has had most of the important novels to review and she has frequently contributed to our columns editorials and signed articles. The letters follow:

The Editor to Mrs. Harris.

I have just finished reading *The Recording Angel* and I have also reread "The Circuit Rider's Wife." I have a good mind to write a leading review about *you*, not about your books, taking *The Recording Angel* as an excuse. I do not thoroly like *The Recording Angel* and I think I can give sound reasons for it, tho it is abominably good. You are too worldly-wise in that book and your characters are all a despicable sort of people, every blessed one of them. You ought not to waste your time with such people in literature any more than in real life. It is only legitimate to use them as foils for better ones. Now in "The Circuit Rider's Wife" you depict two characters that are each in their own way ideal—yourself and your husband. They grip the reader's heart—I don't know which the most.

You had better look out and beware of "success." Of course I do not mean that literally, but please get back to the quiet "scriptures of the heart" in which you excel.

Mrs. Harris to The Editor.

As to your declaration in your letter that every character in the story is "despicable," I do not take you seriously. I know you laughed when you dictated that. You wished to draw my fire. . . . I do not believe you think every character in the book is despicable. Only two are, Mrs. Fanning Rucker and her son. The others are beautiful and good and adorable according to their limitations, even as you and I. Can you say after reading the old captain's speech about the removal of his war comrades from the noisy cemetery that he is despicable? We all have contemptible streaks in us. Am I to be condemned because I am veracious enough to put them in? Can you see old Mrs. Alexander Rucker Martin kneeling at the altar with her queer pretext, with the curtain between earth and heaven raised, despicable? I think not. She is only narrow and ignorant. This is the basis of the sincerest Phariseeism, and you know it exists in many good people. I have seen horrible traces of it in you, in myself, and many another better man or woman! But I never thought you despicable, neither is Mrs. Martin. It is the distinction of the literary art in so far as it is an art at all, to portray the real life, the inner as well as the outer life. And can you say that the Clancy girls were "despicable"—they, whose sweethearts were poverty and privation, women beautifully chaste who were and are neglected by the men who should be their lovers. They are not despicable. They are the living accusations of the selfishness and grossness of the men who were too mean to marry them at the time they should have been married. Society is full of such women, and it is not wrong to portray the pathos of their condition. It is not I who make such women ludicrous, it is society. My business was to portray them as they are. And Colonel Lark is not despicable. I do not remember that any one ever thought Barkis was despicable because he sent

*THE RECORDING ANGEL. *By Corra Harris.* Garden City: Doubleday, Page & Co. $1.

Peggoty word that he was "willing." I have caught a glimpse once or twice of such men myself. They did not strike me as despicable or contemptible, merely fat and natural. As for Tony Adams, that poor last one whom Amy White had the vision to see first in her kingdom of heaven, because he felt too much his limitations in goodness to do great and shining deeds, but who did so many little obscure ones in his adorable humility —I do not think God would call such a publican "despicable," and the man who dares do it shows his lack of vision into the kingdom of God. And the one who thinks Clark Story worthy of contempt would also despise the artless passion of a child who fills his treasure cave with bits of glass and brightly shining stones. We all have a little of Clark Story in us. For one I have no doubt our guardian angels shed tears of pity over us every night knowing of our dreams that shall never come true. Your angel has forsaken you if you think such a man is "despicable."

And do you think the members of the Women's Club in Ruckersville were despicable"? They could not write literature—none of us can, these days—but, dear sir, they wrote innocence, purity, ideality in their foolish little doggerels, which is greater praise than you can bestow upon some famous works of literary art. They may all have been mute Miltonesses but they were not inglorious. They did not achieve the infamy of success which is so easy to achieve now with a wanton's pen, even when a virtuous woman guides it. I did not create Mildred Percy, but God has created some tens of thousand like her, and whatever society, poverty, wealth, license and false ethics do for such women they are very far from deserving contempt. I begin to think it was because they remained pathetically good that some call the women in this story despicable. They were only helpless. It was neither wrong nor vicious to portray their helplessness. To be helpless is often to appear ludicrous. It is *we* who have the ignoble beam in our own eye. Take care how you call such women "despicable." God has a way of damning us for making fun of the weak and defenseless. I showed them forth as they are. This itself may have been a sacrilege. They are holy beings. But my purpose was to awaken society to the existence of these women who are so much forgotten in the licentiousness and dishonors of serpent lives in modern fiction. Not one of them transgress the instincts of modesty and chastity. Call them "despicable" at your own risk. I make no exception of Sylvia Story who achieved in spite of heredity the charm of sanctity, as well as the reality of virginity. Such women deserve double credit for goodness. I have known many a one with a better ancestry to lose her honor in a romance before it was half over. In what particular is Sylvia Story "despicable"?

And Jim Bone: You do not like the yeast that changed "cake-dough" humanity from a dead romanticism into a living enterprising civilization! I have observed this antagonism to yeast souls before. But I will tell you this: Yeast is not good, it is not a diet. But it makes good *bread*—which is the staff of life. This is my defense of Jim Bone. He was not good, but he achieved a good thing. No man is despicable who can do that. He may be offensive, but it is an evidence of supersensibility to despise him, if not of something even less admirable.

I admit that there was much to despise in Elbert White, but over and above that, he was capable of an ideal devotion in many particulars. The pathos of his cowardice had an element of the heroic in it, God bless him! And God bless every such man! For one I am not sure but that He will know better how to do it than to bless some of those who despise these forlorn cripples of morality.

It is all in your point of view whether you consider such people despicable. But I myself would not like to get at the angle of vision which produces such points of view. I will tell you what I think: To the Devil, we are all despicable, absurd by-products of evil in the world, victims of his everlasting disorders. But to God, dear sir, we make a better showing, even the worst of us. I do not think that He takes up so much of His time remembering that we are dust, but most of it adding up what we are over and above the dust. In my

story, I ventured in a small way to show Amy White in this attitude of sweet multiplication. If every angel in heaven should say that Amy White was despicable, I should retort, "Go get your wings sheared off! *You* are no angel."

I admit this, that there is something of the devil in every honest dramatist of human nature, otherwise he could not get all of human nature in, could not throw certain lights upon it. But I do thank my heavenly bodies that there is not enough of Satan in me to find the men and women portrayed in the "Recording Angel" despicable.

Social Reform and the Constitution. By Frank J. Goodnow. New York: The Macmillan Co. $1.50.

In this work of deep learning Professor Goodnow presents with conspicuous clarity and saneness the decisions of our various courts, in order to ascertain to what extent the Constitution of the United States in its present form is a bar to the adoption of the most important social reform measures. He shows that we have reached a condition that may be called "judicial despotism," with judges frequently declaring unconstitutional those acts of legislatures that introduce reforms which are necessary to bring our law in accord with our economic conditions. Two theories, now obsolete, were made the basis of the American constitutional system, viz.: (1) the social compact doctrine, and (2) the doctrine of natural rights. Tho most American lawyers regard these doctrines as inapplicable as legal principles, yet there they are, embedded in the constitutions and bills of rights. The United States Constitution is "practically unamendable." What, then, can be done? Must the means by which other civilized nations have adjusted their laws to existing economic and social arrangements be forever denied to the American people? Shall the dead hand of the eighteenth century be always tightly clutched round the neck of our legislatures? In the States the remedy is comparatively easy, since the State constitutions are readily amendable. But little hope is held out by the writer of curbing the power of the Supreme Court of the United States. Since that court would itself be the judge of the constitutionality of the means adopted for restricting its authority—limiting its appellate jurisdiction, requiring a unanimous vote for nullifying an act of the legislature and the like—the chances of thus accomplishing the purpose are not good. Only one method seems to the author available, the method of constant criticism, that the court may be brought to adjust its views to modern conditions. Open complaint of judicial findings is not merely permissible, it is a high patriotic duty, a duty which Jefferson, Jackson and Lincoln, long before Roosevelt's day, did not shirk.

A History of the American Bar. By Charles Warren. Boston: Little, Brown & Co. $4.

The rapidly growing interest in law and government reflected and stimulated in our schools and colleges, and by the many books thereon for the general reader, gives point to President Ezra Stiles's plan of some hundred and thirty years ago for an American professorship, which plan, a very important historical document, may be found in Mr. Warren's *History of the American Bar.* Dr. Stiles wrote with prophetic sagacity that a professorship of law was "equally important with that of medicine; not, indeed, toward educating lawyers or barristers, but for forming civilians. It is scarcely possible to enslave a republic of civilians well instructed in their laws, rights and liberties." There are many biographies of Hamilton, Wirt, Marshall, Webster, Choate, Story, Lincoln, and of lesser giants in the law of the United States, and many sketches of lawyers and judges of great fame in their day, and many accounts of local bars. The wealth, not the scarcity of the material, has caused lawyers and laymen to wait long for so adequate a survey of the subject in its entirety as this history by Mr. Warren. He begins with the colonial dark ages of the law, when the Assembly was the court, the "attorneys" were clerks, traders, land speculators, and clever penmen and easy talkers, unlicensed and glib, and the subject of repressive legislation; and why not, law was not stable, the fee hunting, untrained pettifogger was in the land, and the fine old village squire was far in the future. The leading lawyers of the Colonial period were men educated in the Inns of Courts of

London, and with them the Common Law of England came naturally to the front. Mr. Warren notes the great cases whereby the Common Law has been modified, extended and fitted to our needs, as it was when Hamilton in the Croswell case successfully attacked the English law of libel and gave us that liberty of the press which has been used from time to time. The limited law libraries of John Quincy Adams, Chancellor Kent, Webster the Expounder, and other great legal minds seem impossible, yet their few books were absorbed; they spent on the substantive law as much time as a skillful practitioner now spends on the Code of Procedure. As the history advances, the changes in methods of preparation for the life of the law are noted, and a chapter is given on the truly formidable list of important books that America has contributed to the professional world, from Kent's "Commentaries" to Wigmore's "Evidence" and Beale's "Railroad Rate Regulation." To the lawyer not the least interesting part of the history is that devoted to the outcry against reports and text books and the crusade for codes, a crusade that began with Bentham and took courage when Napoleon promulgated his code; and he will enjoy, as he always has enjoyed, De Tocqueville's description of American lawyers as America's aristocracy.

North Sea Fishers and Fighters. By Walter Wood. New York: E. P. Dutton & Co. $4.

The author of this book was a resident of the east coast of England for many years, and has made a study of deep-sea fishers both ashore and afloat. He finds first-hand information difficult to get, as the fishermen are neither vain nor loquacious. In telling the story of the North Sea, reference is made to the bloody conflicts between Great Britain and Holland, in which the former, after two and a half centuries of maritime warfare, won the control of North Sea trade. The author hints at the possibility of a future conflict with another powerful and jealous neighbor—Germany. One of the most interesting passages in his book is the description of the firing on the fishing vessels by Russia's Baltic fleet under Admiral Rojestvenski, on October 15, 1904. The details are supplied by the narratives of the men under fire. The Russian fleet left Libau, solemnly blessed by the Czar, and only a few days later mistook the trawlers for Japanese torpedo boats and opened a destructive bombardment that lasted twenty minutes. No shots were fired in return—green rockets were sent up by the trawlers: all to no avail. Two men were killed, several severely injured, and one trawler sunk; and damages of $325,000 were ultimately paid by the Russian Government. The book is profusely illustrated in black-and-white and with colored plates, as also from photographs.

Literary Notes

....If one has the instinct and desire for *Eloquence* (Harper; $1.25) he will find in this new volume by Garrett P. Serviss many helpful suggestions relating to the preparation for and practice of that high art.

....A volume of *Ancient Jewish Proverbs* (Dutton; 60 cents) has been added to The Wisdom of the East Series. The compilation is made and furnished with a serviceable introduction and notes by Rev. A. Cohen, of Manchester, England.

....*Ji Yung, a Beautiful Gem* (Richmond: Smith & Lamar; 50 cents), by Janie H. Watkins, contains the touching story of a Chinese girl educated in a mission school. The story is made up largely of selections from Ji Yung's letters to her teacher

....Many common-sense observations in regard to the nature, purpose and results of sleep, the amount of time that ought to be devoted to it, the causes of wakefulness, and even technical discussions are to be found in Bolton Hall's rambling chapters on *The Gift of Sleep* (Moffat, Yard; $1.25).

....Rev. R. H. Coats, M. A., has written a clear and discriminating discussion of the three great historic *Types of English Piety* (Scribner), the sacerdotal, the evangelical and the mystic. The characteristics, the services and defects of each type are set forth in a sympathetic and instructive way.

....From the Pilgrim Press come three booklets by favorite religious writers. Dr. Cadman describes with his accustomed eloquence *The Religious Uses of Memory* (50 cents), Dr. Gordon discourses on *The Mission of the Prophet* (25 cents), and Dr. Grenfell writes with conviction and winning power *On Immortality* (50 cents).

....Amid the turbulent and conflicting religious currents of modern life the Rev. Richard Roberts, of London, detects many sure signs of *The Renascence of Faith* (Revell; $1.50), all of which he portrays with skill and enthusiasm.

... Mr. Reginald Wright Kauffman sees *The Way of Peace* (Moffat, Yard & Co.; 50 cents) only in social evolution, the uprooting of error and the establishment of justice, the banishment of moral corruption and the domination of the higher impulses in humanity. The essays are written with fervor and boldly attack the obstacles to human progress which have too often been regarded as necessary evils.

....The English translation of Dr. Albert Moll's *The Sexual Life of the Child* (Macmillan; $1.75) is a welcome addition to the rapidly growing literature of the subject, particularly useful to physicians, clergymen and teachers because the author's wide range of illustration from actual cases will serve to check the tendency to rash generalization commonly shown in this field. The style of the book is repetitious and confused.

....*A Year in a Coal-Mine*, by Joseph Husband (Houghton Mifflin; $1.10), is a record of the experiences of a young Harvard graduate, who sought practical experience in mining by performing the regular duties of an unskilled employee. An intimate knowledge of life and conditions in a mine may be obtained from this narrative. The author is modest, but we suspect that he was something of an athlete, and also that he learned all there was to know about practical mining.

....*False Modesty That Protects Vice by Ignorance* (Forbes; 50 cents) is an appeal by Dr. E. B. Lowry for the proper education of the young in matters of sexual hygiene. Parents who are aroused to this need will find valuable help in performing their duties in this respect in *The Edward Bok Books* published by Revell. The three so far issued are entitled *When a Boy Becomes a Man*, by H. Bisseker; *How Shall I Tell My Child?* by Mrs. Woodallen Chapman, and *Instead of "Wild Oats,"* by W. S. Hall. (25 cents each.)

....Dorothy Canfield is a writer whose growing power in fiction we have watched with great interest and hopefulness for many years and we are glad and not at all surprised to see it result in that remarkable novel, *The Squirrel-Cage* (Holt; $1.35). Remarkable we call it because it shows an earnestness of purpose and a sincerity of manner that raises it far above the level of the average novel. It treats of real things in a real way. Instead of the traditional fictional themes, mostly imported from Europe, it deals with an every-day problem of vital importance in America, the absorption of men in the whirl of business and the absorption of women in the whirl of society and their consequent alienation from each other.

....The text book in the Interdenominational Home Mission Study Course for the coming year will be *Mormonism, The Islam of America* (Revell; 50 cents), by Dr. Bruce Kinney, who was for many years superintendent of Baptist Home Missions in Utah. There is a short account of the history, organization and methods of the Mormon Church, and the most significant features of its religious claims and practical tendencies are judiciously set forth.

....It doesn't take long to get immersed in a story by E. Phillips Oppenheim. However unprofitable he may be in characterization, he is at least entertaining, to say nothing of exciting. *Peter Ruff and the Double Four* (Little, Brown; $1.25), is a detective narrative that out-Sherlocks Sherlock Holmes. Thru over four hundred pages of adventure, we are carried along with Peter Ruff into the most amazing plots. Peter is a private detective of international fame, as cool as Raffles, as daring as Sherlock. The Double Four is a secret society of unlimited power. Mr. Oppenheim's fertility shows no abatement. The cry is, still they come!

....Nothing is more interesting in its way than a well made book catalog. From one of the London dealers we receive a catalog remarkable for its Meredith offerings. Who would not like to own Meredith's copy of Hugo's "Orientales" in the édition Elzevirienne? Thrust between "Lazzara" and "Vœu" is a bookmark on which the reader wrote: "Our deepest thoughts we owe to death." Meredith seems to have established himself as a favorite subject with collectors, for this book is priced at 75 shillings, while an autograph letter written from the Garrick Club, discussing the education of his son Arthur, is valued at £18 18s., and other letters higher still.

....*Myra*, a lyric drama, by William Dudley Foulke (Cosmopolitan Press; $1.25), presents good stage possibilities. The scene is laid in Yucatan, prior to the Spanish occupation of that country; the scenery wild, picturesque, but not beyond the mechanical contrivances of the theatre. History has very little to do with the facts, which the poet may trifle with as he pleases, and Mr. Foulke pleases to trifle with them a good deal in the interests of love and romance. There is attractive dialog, tenderness of the old school, and passion

of a still older time. One need not analyze the characters; they are not strikingly novel; the poet has made them out of a thousand books.

....There is a type of literature that some people call frank. There is another type, which has much the same odor, written with the idea of carrying people successfully thru the mire in which others have floundered. Hugh Gordon is the author of *The Blind Road* (Moffat; $1.20), a tale of married life which ends in dire catastrophe, after minute descriptions of romantic loves and sharp awakenings. The story is told in the first person—a husband's detailed account of trust and estrangement. The narrative and its sentiment are conventional and obvious, and so are its elements of "daring."

....Beginning with a summary of the little that is known of secular, as distinguished from ecclesiastical, embroidery wrought in England from Saxon to Tudor times, M. Jourdain's *History of English Secular Embroidery* (Dutton; $3.50) traces the development of a curiously interesting art from the Tudor and Stuart periods, of which many examples exist in public and private collections, down to the early nineteenth century. This is the first authoritative treatise on the subject; it includes some account of samplers as well as of such ambitious efforts as needlework copies of pictures and engravings, and it is both pleasantly written and informing.

....Thruout the period covered in Professor E. D. Adams' course of lectures—the Albert Shaw lectures on Diplomatic History—now published by the Johns Hopkins Press with the title *British Interests and Activities in Texas 1838-1846,* much curiosity was manifested in this country as to the attitude of the British government toward the question of Texan independence. The slave-holding South was particularly curious. According to prevalent belief, Great Britain was exerting her influence to prevent the annexation of Texas, her idea being to secure abolition there as a preliminary toward the victory of abolition in the Southern States. This belief had a large share in shaping our national policy. Its effects were seen in the campaign of 1844. With the later historical judgment which questions the soundness of this popular conviction Professor Adams does not altogether agree. His view cannot be readily condensed, nor will the casual reader readily grasp it; for the author, whose method of presentation is purely technical, makes his way through a tortuous maze of diplomacy. The specialist will find much to praise, and not least Professor Adams excellent judgment and his severe, direct style.

Pebbles

"WHAT is home without a mother?"
"An incubator, I guess."—*New York American.*

NO place feels like home after you have once lived in the White House.—*Brooklyn Eagle.*

CHARLES EVANS HUGHES refused to be either a dark horse or a goat.—*Cleveland Plain Dealer.*

OUR notion of wasted effort is the job of cross-examining John D. Rockefeller.—*Milwaukee Sentinel.*

SOME men are born rich, some achieve riches, and some are Southern delegates.—*Cleveland Plain Dealer.*

WITH the National Committee as referee we believe Mr. Taft would never lose a golf game, either.—*St. Louis Republican.*

AFTER it is all over, it will be almost like a vacation to Senator Dixon and Mr. McKinley to be able to tell the truth again.—*Columbus, Ohio, State Journal.*

SENATOR WILLIAMS estimates that it costs the Government $6 to bathe a Senator. This is nothing to what it would cost to whitewash one.—*New York Evening Post.*

"Now," said the lawyer, "please tell us how the altercation began."
"I didn't see any altercation," replied the witness. "I was too busy watchin' the fight."—*Chicago Record-Herald.*

"DOES any one know," writes a lady to Marion Harland, "that cherry leaves boiled with plum jelly make it taste like cherry jelly?" But does any one know that sauerkraut boiled with cherry jelly makes it taste like Tophet?—*Chicago Tribune.*

AN anxious correspondent wishes to know whether a lady who is sent by her constituents to a national convention, should be referred to as a delegatess or a delegatrix. Why not make a bid for the German vote by calling her a delegatessen?—*Chicago Record-Herald.*

"WE must go to Stratford."
"What's the use? We can buy Stratford postcards in London."
"My friend, one travels for something more than to send postcards. I want to write my name on Shakespeare's tomb."—*Louisville Courier-Journal.*

"A WOMAN came into the hospital the other day and she was so cross-eyed that the tears ran down her back."
"You couldn't do anything for her, could you?"
"Yes, we treated her for bacteria."—*New York American.*

The Independent

Entered at New York Post Office as Second Class Matter
Publisher, Clarence W. Bowen
130 Fulton Street - - - - New York

A WEEKLY MAGAZINE FOUNDED IN 1848
One Year, $3.00 Single Copies, 10 Cents

Single copies over six months old, 25 cents. Postage to any foreign country in the Universal Postal Union, $1.75 a year extra; to Canada, $1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as those offered by any responsible agency.

An order for the change of an address should be received two weeks before the change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of the publisher's price any book reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with $1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. Even so, we cannot hold ourselves responsible for their return. Authors should preserve copies of their manuscripts.

Advertising rates will be furnished on application.

The Roosevelt Party Movement

THERE is internal evidence in the call for a convention to form the projected new Roosevelt party that it was written by Mr. Roosevelt himself. Again he expresses his disapproval of "crooked political bosses," asserts the right of the people to rule, asks for social and industrial justice, and, in speaking of the legislation to be desired, uses those curiously balanced phrases or vague definitions which have characterized many of his public utterances. The call is addrest to those who "realize" (as, of course, Mr. Roosevelt thinks he does) that "the power of the crooked political bosses and of the privileged classes behind them is so strong in the two old party organizations that no helpful movement in the real interest of our country can come out of either." We do not believe this is true of either party. If Mr. Roosevelt were still a partisan Republican it might be expected that his opinion of the Democratic party would be unfavorable, but, whether he is still a Republican or not, his denunciation of the Republican party (being, in our judgment, undeserved) savors of ingratitude. It has drawn the following comment from Thomas L. James, who made a creditable record as Postmaster-General in Mr. Garfield's Cabinet

"He has been in office almost ever since he left college, excepting two or three years after his defeat as a candidate for Mayor of New York. Except for that interval, he has held office, appointive or elective, nearly all of his active life, and at the hands of the Republican party. Moreover, many of the leaders whom he has accused served him faithfully while he was in public life."

This call does not set forth, except by generalizations, what the new party's platform is to be. But several planks of that platform are suggested by what Mr. Roosevelt has recently said and in other ways. Of course, he is to be the party's candidate for the Presidency. At the beginning, therefore, must be the assertion that he is entitled to a third term and is the first American who has deserved to hold the office for more than eight years. In the second place, probably, will be a demand for the recall of court decisions as to important constitutional questions by a majority vote at the polls. Then there will be an assertion that he was cheated out of a regular nomination at Chicago. Bosses, Flinn and certain others excepted, will be denounced. A strict enforcement of the Anti-Trust law will be opposed. This is foreshadowed by Mr. Roosevelt's recently exprest opinion. He says it was not intended that the law should be enforced strictly, and that such enforcement would be harmful to farmers' associations.

What the platform will say about the tariff cannot be foreseen. If it shall set forth Mr. Roosevelt's views, it will not differ much from the Chicago Republican platform, for he supported the New York platform of 1910 (which might have been written by Senator Aldrich), and has commended the use of an expert commission or board. He is inquiring now about the effect of the tariff upon the cost of living, and is already convinced that import duties have not increased the prices of butter and eggs.

It is indicated in the call that the commandment "Thou shalt not steal" will be a part of the platform. The suggestion is made that "Thou shalt not bear false

witness against thy neighbor" should be added. But this suggestion comes from friends of Mr. Taft who read reports of the speeches made by the ex-President during the recent canvass. With the commandment forbidding theft there will be no reference, we presume, to about 150 delegates' seats in the Chicago convention, Roosevelt claims for which were rejected by the votes of all of Mr. Roosevelt's friends in the committee. Among these claims were those from the South which had been manufactured "for psychological effect." When Mr. Roosevelt's friends (Senator Borah and others) voted against these claims they virtually said to somebody, "Thou shalt not steal."

This was the meaning of their action with respect to all of the Indiana contests (two excepted), of which, speaking of the Taft delegates, Mr. Roosevelt had said and even then was saying that "they represented absolutely nothing but fraud as vulgar, as brazen and as cynically open as any ever committed by the Tweed regime in New York forty-odd years ago." In connection with the commandment against theft something might be said about Presidential electors.

Immediately after the nomination of Governor Wilson there were signs that the movement for a new or Roosevelt party had suffered a check. In the call's list of signatures names which some expected to see there are missing. Several Roosevelt leaders went over to Mr. Taft. The movement for a new party was opposed by Governors and other prominent men who had stood with Mr. Roosevelt in the Chicago convention. Republican Progressive Leagues in one or two States decided to work within the old party; in one or two others they voted, at conferences, to support Wilson; in other States the Roosevelt Progressive forces were divided. Governor Hadley said he would do what he could to prevent the making of a third party in Missouri. "The Republican party," he added, "is already a Progressive organization." Said Governor Osborn, of Michigan:

"I do not think a new party erected upon the passions of any number of men can live. When those who are righteously angry because of the action at Chicago come to their senses they will discover that they are angry at certain men in the Republican party and not at the splendid old party itself. One-half the work necessary to create a new party, if directed to purify the Republican party will produce tenfold better results."

But he thought the people should be enabled, by temporary measures, to vote for Mr. Roosevelt, and that those Republicans who were not satisfied with Mr. Taft could vote for Governor Wilson without bolting.

Many of those friends of Mr. Roosevelt, however, who oppose the making of a new party will use their influence to secure for him the votes of their States' Presidential electors. Their plan and Mr. Roosevelt's plan is that in States where the organization is controlled by Roosevelt Progressives the electors shall vote for Roosevelt; that in States controlled in opposition to him there shall be a Roosevelt ticket. Mr. Roosevelt says he is willing that the new organization in any State where there is no real Republican party shall be called Democratic Progressive. "The titular Republican party," he asserts, "has no moral right to the name, and every honest Republican who is true to Lincoln's principles must vote with us." He also says: "If any elector named at the primaries last spring is to act honestly he must either vote for me or not run for elector at all."

There is no way to compel an elector to vote for any candidate. His obligation is a moral one. It is estimated that not less than 70 of the men who have been made electors intend to vote for Mr. Roosevelt. In several States where such action is foreseen or expected, there will be two Republican tickets, and Taft electors will be nominated by petition. This course will be taken under some difficulties, and it is quite probable that controversies arising will be sent to the courts. If the new party is formed, therefore, and if the plans made by Mr. Roosevelt and his supporters are carried out, the strength of the Republicans in the electoral college will be divided, to the advantage of the Democratic party. There will be litigation and lasting dissension. We do not believe that the proposed Roosevelt party can elect Mr. Roosevelt; it can only defeat Mr. Taft.

Would a division of the Republican party and the defeat of Mr. Taft promote the Progressive cause? Those who signed the call for a third party convention, and others who now intend to procure for Mr. Roosevelt support in the electoral college should carefully consider this question. A new political party, if it is to amount to anything and is to serve the public interest, must have a broad moral basis which this proposed party would lack. This movement is characterized by false pretenses. It promises to be marked by treachery and factional litigation. It began and has proceeded in the interest of one man's ambition. The effect of it, if it shall continue, cannot be beneficial, but must be harmful. In the interest of the general welfare it should be ended.

What the Department of Agriculture Is Doing

WHAT the Agricultural Department is doing in the way of introducing new plants, especially new fruits, constitutes a chapter in American history of great importance. Already our common gardens are tolerably well supplied with vegetables and fruits from every quarter of the globe. In our orchards there are apples that have been brought in from Russia and Turkestan, peaches from China, and cherries and persimmons from Japan. Men are kept abroad all the time, ransacking the world for new things, or improvements on what we already have. The last bulletin of new introductions was issued May 31, and it is astounding to find in the inventory contributions from Siberia, South Africa, Kashgar, Palestine, British West Africa, Manchuria and the Philippines.

We are told that the area of inhabited country on the globe which is visited by zero temperatures, and under this malign influence, is confined almost entirely to our own northern hemisphere and to the tops of mountains. It is for this reason that we find a great many plants in Europe and Asia which we hope to make use of in this country, but that in some way must be acclimated. Such a temperature as prevails on our great plains, during the winter, would wipe off vegetation from the continents lying below the equator, and would nearly ruin all the agriculture of central Europe. We are told that the eucalyptus, which in this country can only be grown in southern California, and middle and southern Florida, can be found on the west coast of Scotland.

The present inventory sent to us by Secretary Wilson, or more directly by Dr. David Fairchild, contains plants obtained by Frank N. Meyer, during an exploration trip across the mountain range which lies between Chinese and Russian territory, a region with vegetation thirteen thousand feet above the sea and possessing a climate much like that of the Upper Mississippi Valley. Besides what Mr. Meyer furnishes, we have a good deal from the Philippine Islands, gathered by Mr. C. V. Piper, and our consuls have added more or less from many different sections. There is a new berry called the akala, in the rubus family, and there are over thirty varieties of alfalfa and fourteen of clover to be tested by our farmers, hoping to secure varieties that will make fodder and hay in Florida and the farthest North.

There are seventy-seven varieties of rice for our Southern States, and there are two novel forms of potato from the mountains of Peru, and there is a tropical leguminous plant which forms tubers that taste like the potato, and there is a palm that resists the drought admirably and that furnishes a syrup of high value. There are new strains of oranges and hardy stock for such fruits, hoping to carry them a little farther north than at present. Perhaps nothing more important is found in the whole list than a collection of soja beans from Manchuria. This bean we have hardly begun to find out. It is not only a legume of great value for creating humus, furnishing at the same time a vast amount of human food, while the fodder is of high value, either green or cured, but some of the varieties furnish a paint oil, and there is a sort of milk, not at all unlike cow's milk, manufactured from some varieties of these beans.

The persimmon, which has grown so immensely in value in the Southern States by the introduction of Japanese

varieties, is being widened in its value by varieties that furnish a fermented waterproofing. There is a new pine, which grows to a hight of two hundred feet and has cones twelve inches long. There is a lemon from high up on the Himalayas, which is not injured by severe frost and is of decided importance to growers of this fruit. The lemon as we have had it is more tender than the orange, and its cultivation will be greatly increased as soon as we get a variety frost resistant. A new fruit called *annona* comes to us from Brazil. The fruit is nearly spherical and weighs about six ounces. The taste of the fruit is not unlike an apple, while the tree resembles a persimmon. We evidently may have here something worth the work of our horticulturists to improve.

The Chinese flat peach, which has been doing good service in Florida, but where its varieties are too small, is represented by a large, luscious sort from Shantung that may double the value of those now cultivated. Three new sorts of passion fruit, offering edible fruit, come to us from the Society Islands and elsewhere and open a new volume of garden enterprise. Melon seed is distributed that will give us fruit that will last all summer. A Christmas melon will, of course, be not only enjoyable but truly valuable. A banana comes from Paraguay which grows to a hight of twenty-five feet. The bunches of fruit often weigh one hundred pounds, and the flavor is said to be the finest of all bananas. Special effort has been made to collect rubber trees, and our common lawn trees, such as maple and ash and linden, have added varieties. The peanut, which has recently had a great impetus given to its culture, is represented by new varieties in this bulletin. Cotton also has had attention, and whatever promises better yield or weight of bolls has been collected.

This is enough to make us grateful, but it does not begin to cover the list. There are new sorts of poplars and willows; new apples and pears and apricots and plums; new mangos and carobs and plantains; new honeysuckles and iris and roses and clematis, and special effort to secure a hardy blue poppy; new shrubs like barberries and spireas; new wheats and barleys and oats; new rhubarb and asparagus and lupins; new grapes in large variety; and with all the rest there are new potatoes and sweet potatoes; and more varieties of the dasheen, which the Department some time ago told us was likely to be a rival of the potato.

If one-quarter of all this story were all that could be told, it would be enough to warrant the expense of doubling appropriations for the Department of Agriculture. We are being enormously enriched by these importations. They not only enrich us materially, but awaken the enthusiasm of our producers. They are distributed about the country, in the hands of skilled investigators and skillful culturists, to be tested. Some things will be of no special value for this country, but others will prove to be of more value than could be anticipated—even of revolutionary influence among our food products. The bulletin before us covers only from April 1 to June 30 of this year, and the inventory extends from 30,462 to 31,370. The work grows in volume and in value. If waste has characterized American life up to the present time we are certainly now entering an era of acquisition and farm economics. Altogether the story is one that should be read by every member of Congress, in order that he may understand the real nature of agriculture, its relative place among the industries and the possibilities ahead.

Up to date we are an agricultural people, devoted to manufacturing; we are a land of farms, half cultivated; we are a land of enormous wealth, one-third annually wasted; a people not yet awake to the fact that we are to feed an enormously increasing population, and a large part of the world besides. It is not from the loom that comes our wealth, but from the loam, and out of the loam we must learn to charm those resources which will make us capable of meeting the demands of the future as well as the present. The conservation of natural resources, complemented by the accumulation of such resources as we have named, is the special glory of the present time. An increased navy is as nothing to this enlargement of American resources, and should so be viewed by the Government as well as the people.

Tissue Survival and Transplantation

PROBABLY the most interesting subject in experimental medicine in recent years has been the investigation of the life of tissues independently of the life of the organism to which they belong. It has been found that a great many tissues exhibit vital manifestations for a considerable period after the animal from which they came is dead, or after their complete separation from all possibility of communication with the vital forces of the animal to which they originally belonged. First this partial survival seemed very startling, but after all certain phases of it have attracted the attention of mankind for a long while. It has been known, for instance, that sometimes the hair of dead bodies grows, and that this growth may even continue for months after death. The nails may also grow. The usual explanation offered was that a certain amount of vital energy had become stored in the merely vegetative functions of these tissues and this growth had proceeded in spite of the death of the organism, because by chance conditions were favorable enough to provide nourishment.

Such phenomena were often very disturbing to philosophic principles or special systems, but the facts were well known. Other related phenomena had also been noted. For instance, there is the tradition widely diffused, among country boys at least, that the tail of a dead snake does not die till sundown. The tradition is founded on the observation that the tail of a snake, even after the crushing of its head or some other injury that surely kills the animal, will still wiggle slightly when touched and evidently contains some power of vital reaction. For a long time it has been known that the heart of the frog will continue to beat for a considerable period after its removal from the animal, and that, under certain circumstances, its activity may be prolonged for hours or even days. A frog's heart beating away vigorously on a plate while its possessor is long dead is rather startling when first seen. If the heart, however, is so placed that a salt solution will flow thru it under the influence of its own beating it will actually continue to do work for many hours. When it stops it is because it is choked with effete products and not because it is exhausted. If the salt solution passing thru it will carry these off the heart will do work effectively for a considerable period.

From these well-known observations to certain modern developments in the keeping of tissues alive after their removal from the living animal is not a far step. During the past decade particularly a number of men have been growing animal cells in various nutritive solutions. In very recent years Dr. Alexis Carrel, at the Rockefeller Institute, has engaged in these investigations. Up to this time it has been presumed that, while the vital activity of the tissues of cold-blooded animals, being of low grade and little dependent on intense vital processes, might well survive, those of warm-blooded animals almost surely perished, that is, ceased to have life within a very short time after their separation from the body, or the completion of that process that we know as death, in which the co-ordinate function of the various organs of an animal ceases. It is true that certain hibernation processes in warm-blooded animals showed that there might be almost a complete arrest of vital processes for even a prolonged period, showing the provision of nature for protection against unusual conditions. Besides certain observations made on submerged persons showed that a fainting process might be so complete as to cause what looks like absolute cessation of vital functions, yet the awakening of the individual into life again is not precluded even after immersion for half an hour or more. Ordinarily anything more than three minutes of immersion must be considered fatal. If the individual has been scared into a fainting fit, however, by the danger and the exhaustion of unavailing efforts, life may be preserved in a sort of lethargic state even for as long as two hours.

With these facts in mind Dr. Carrel's results are not so surprising. He has been able to take portions of chicken hearts and keep them beating provided arrangements were made for removing exhausted material as fast as it was manufactured, not only for days, but for

weeks and months. A portion of chicken heart, for instance, may be kept beating under these circumstances for days, then placed in a cold storage chamber, where it will cease beating, but where the cold will prevent deterioration processes and where, of course, microorganisms will have no chance to grow, and then by irritating the muscle fibers after they have been inactive for days or even weeks they will begin to beat rhythmically once more, and under proper circumstances continue the beating.

Motion as a vital manifestation is easy to appreciate, but other vital activities are more difficult of recognition. Dr. Carrel, however, has been able to keep tissues alive in cold storage for long periods, because when these were grafted into living animals they exhibited all the manifestations of life after a time, and were not treated as foreign bodies or as dead materials by the tissues of the living animal, which ordinarily guard themselves very jealously from the intrusion of non-living matter. Portions of arteries and veins have been thus kept and transplanted with complete success. Dr. Carrel has gone farther, however, and has even removed whole organs as muscles and even the more complex organs as kidneys from one animal in order to transplant it into another and has successfully accomplished the transplantation. These complex and highly organized tissues may be preserved from degenerative processes just as simpler tissues, so that the whole field of the possibility of transplanting new organs is opened up.

Dr. Carrel's discoveries were at first received with some skepticism when reported to the Paris Academy of Medicine June 19, but they were confirmed on July 10 by a paper read before that body announcing that two Rumanian physicians, by means of his methods, had succeeded in preserving alive for several weeks fragments of mammalian nerve tissue immersed in the plasma of the animal and also in inducing the tissue to grow and develop new cells under these conditions.

At first this idea seems so startling that it may be deemed almost an impossibility. We have certain familiar experiences, however, that readily dissuade us from using the word impossible in this connection. Dentists now transplant teeth or occasionally remove a tooth, scrape its roots and replace it and have it become fast in the gums once more. We have found, too, in the historical developments of recent years that this is not a new idea, but that in Roman times, when, by the way, nearly all of our modern developments in dentistry were anticipated, Roman mistresses occasionally, on the loss of one of their own teeth, had a corresponding pretty tooth from the mouth of a slave transplanted to their mouths, where they frequently took root. Successful experiences with regard to the transplantation of bone are not uncommon. Fresh bone, above all living bone, has been grafted on to the edge of a bony defect and successful coaptation secured.

Our observations in the past have been empirical to a great extent and without a proper basis of organized scientific investigation. Now Dr. Carrel would seem to have brought us to a point where transplantation can be done under scientific conditions and where a great future development of surgery may readily take place. The possibility of taking from young healthy tissued subjects who are killed by accident tissues and even organs that may be preserved under proper cold storage condition until needed for transplantation by the surgeon to the body of persons who lack just these organs or tissues is opened up. It would not be surprising at all if a magnificently significant development of modern surgery should come along these lines, tho so many of the ideas connected with it are unusual, a little deterrent to thought, startling to certain phases of philosophy and generally productive of an uneasy feeling of somehow exceeding the proper bounds of interference with the processes of nature. Such a feeling, however, is only another manifestation of that curious distrust of Providence that hesitated at first over the use of anesthetics, sometimes condemns even yet amputations because, as parents say when refusing to allow the amputation of the limb of a child, let him be as God made him or let him not be,-and in general makes people fear lest they should be invading sacred forbidden ground in matters of health.

Getting Away from Things

WHENCE this mighty migration in the midst of which we are, this rush from city to country and from country to city, this packing of steamers and crowding of trains? What is the force that is moving this mass of humanity back and forth and round and round the world? Is it a force of attraction or of repulsion? The older textbooks on physics talked much of attractions, of mysterious cords that drew one body to another, even of vacuums that "sucked up" liquids. But the modern physicist shows a decided preference for the interpretation of movement, whenever possible, by pushes instead of pulls. He likes to see the engine at the tail of a train instead of at the head of it. May not here, as often before, sociology take lessons from physics and interpret many human motives by antipathy instead of affinity?

Is it really the call of the wild which makes people take to the woods at this season of the year? Is it not rather the distaste of the tame? Are they drawn into the waste places of the earth by pull of the vacuum there or are they impelled to leave the city by the pressure of population? Do they seek the sea because they love it or because they are tired of dry land? Are they so fond of new faces or are they sick of seeing the old ones?

It may be argued on pragmatic principles that the mode of interpretation makes no difference, that a push and a pull being identical in their effects are identical in themselves. The movement is all that is known, so the cause may be what you will. But however that may be in physics, it does not hold for humanity, for here we have motives to consider as well as movements. And motives may lead in many different directions. If it is not love of Europe that sends us abroad, but the desire to escape from America, then that desire might be satisfied by going in some other direction, or even by staying at home, if one could contrive to escape at home from the routine of everyday life.

Probably women do like hotel life better than housework, but it is doubtful if many men really like fishing better than office work. Fishing, however, is recognized by society as a legitimate reason for breaking home ties, and any less conventional excuse would hardly have the same validity. But civilized man finds the return to nature a somewhat painful process, and the wife-less vacation is not what it is cracked up to be. Strange how much more a man misses his wife when she is gone than when she is with him.

Even if we admit that the vacation motive is essentially an effort to get away from things, it is difficult to decide just what things we want to get away from. For lack of a little frankness with ourselves we are apt to run into just what we are ostensibly trying to avoid. People may go to the country for the benefit of their health and there they may be pestered by the typhoid fly or be punctured by mosquitoes loaded with malaria. A man may seek relief from anxiety and responsibility in the forest primeval, and there be worried by weather and camp cares until his nerves are a frazzle. We say we want to get away from all printed matter, so we leave behind us the book that might have interested us, and then we spend our time in camp reading every word in the country paper that comes wrapped around the green corn. We take ship to escape the daily news and then agitate the ether of half a hemisphere in order to extract from it a little information as to the day's doings.

The real vacation is not change of place, but change of mind. But this is not to be got by wishing. Nor can a tourist agency help us out here. Now we can do what we like, we say. But can we? Not unless we know what we would like to do. A man let loose on a vacation is like one who retires from business in order to enjoy life, only to discover that he had been enjoying his former life and can enjoy no other. The rubber band that has been long on the stretch does not rejoice in its release from duty. It lies limp and unelastic on the table, still bent to the shape of the papers it has held together. A vacation teaches us that the things we would get away from have become a part of ourselves. There are no lines in nature. Environment and personality interpenetrate. So we say, "It seems good to get home again," and we slip back into our groove with a click of satisfaction. The

vacation has paid if it has demonstrated that it is an illusion. We can never have a thoroly enjoyable vacation unless we leave ourselves behind.

The Persian Prophet

THE visit of Abdul Baha to this country is an interesting event even to those of us who do not see in Bahaism a new revelation destined to supersede the older faiths. It is interesting, at the least, to have brought visibly before us evidence that Asia, the aged mother of all the great religions of the world, has not yet become barren. For he who is now in our midst is by many millions of people today regarded as a prophet, "yea, and much more than a prophet." The number of his followers can, of course, be only vaguely estimated, because when one embraces the faith he does not necessarily separate himself from the sect or church of which he is a member. For the foremost aim of Bahaism is unity. It would "the Two-and-Seventy jarring Sects" not "confute," but combine. The stanch and inexorable monotheism which Bahaism inherits from Judaism and Islamism leads it do away with diversity and dissension wherever found, in society, religion, or language.

Bahaism is not to be classed with the freak or fake religions which arise among us or are brought to us from abroad. Perhaps there are among its American disciples some of the class who take up with Bahaism because bridge is going out. If so we may at least congratulate them on the change. Bahaism has proved its vitality, its reality, not only by inspiring its adherents to suffer martyrdom by the thousand for the new faith, but still more by inspiring them to live together in peace and harmony, Shiite and Sunnite, Jew and Christian in the same community. It must be admitted, however, that the brief history of the movement is marred by more than the usual amount of such strife as always accompanies the rise of a new sect. There have been schisms and conflicts of authority, theological controversies and squabbles over rank, in which brother has been set against brother, and the sword and the poison cup have been employed to settle religious questions.

As was stated in our issue of April 11, the Bab was executed at Tabriz in 1850; then arose one greater than he, Baha Ullah, who spent most of his life in prison, and his son and successor, Abdul Baha, now in this country, was only released from perpetual imprisonment by the Turkish revolution. He is an aged man now, with a long white beard and a saintly face, worn but peaceful. His bearing is simple and dignified, unembarrased by unaccustomed surroundings, giving his message from a Christian pulpit to a strange audience in a foreign land with the same earnestness and naturalness as tho he were addressing his disciples in Acre. To say "from a pulpit" is hardly correct, since he dislikes to occupy such an exalted position, preferring to put himself upon a level with his audience. Standing upon the floor or walking to and fro, he speaks quietly in Persian, which, sentence by sentence, is translated, tho at times his expressive features and gestures make the services of the interpreter almost superfluous. He wears a small white turban and a black robe over a white girdled garment. He greets the audience by touching his forehead repeatedly with the palm of the right hand and closes his sermon with a half-chanted prayer, standing and holding his hands upward and open, as tho ready to receive the blessing he beseeches.

His message, coming from the most turbulent and dissentious country of the globe, is an appeal for love, peace and unity. He shows how strife and enmity defeat the aims of humanity in every field. "The aim of religion is fellowship and love, so taught His Holiness Christ, but said His Holiness Baha Ullah, if religion become the cause of enmity then surely is irreligion better than religion. Religious teachings are remedies, but when a remedy causes the disease it is worse than nothing." States are founded to secure a greater degree of co-operation among people, but if states give rise to wars then are they altogether wrong. Language is designed to extend the scope of human intercourse, but this purpose is defeated when language is made a means of isolation and disagreement. There should be a common international language which all could

learn and so the whole world be brought into communication. To say that there is a conflict between science and religion is false, for "how can the heart approve what the brain does not accept?" The diversity and discord that exists between the sexes is due to the false education and position of women in the past. "Women should be educated as men are and have the same rights in all things."

Such in essence is the Bahai doctrine, tho stripped of poetic imagery and illustration that grows in a Persian garden. A strange offshoot from Mohammedanism in these latter days—this religion of universal peace, mutual toleration and equal rights. Tho its lessons may be most needed in Islam, yet they are far from being superfluous to Christendom.

Bounties for Babies

THE Government of Australia will introduce a bill into the next Parliament, providing for a maternity allowance of $25 in the case of any child born in the Commonwealth. This is carrying into effect one of the planks in the platform of the Labor party, which also advocates as the next step of the same policy maternity rates of $2.50 a week for three months before and three months after the birth of a child, and, thirdly, pensions for women who, on attaining the age of forty-five years, have six living children, such pensions not to be affected by other sources of income. Australia has special reasons for such efforts to promote the growth of population, for here is practically an empty continent, a land as large as the United States and only four and a half million people in it. The Asiatic races which would swarm into the island are strictly excluded, and even European immigrants are admitted cautiously, so great is the fear of lowering wages and the standard of life. Yet the Australian birth rate has fallen rapidly in recent years, and is now lower than that of overcrowded Germany.

This decline of the birth rate, however, is common to the whole civilized world, and it is generally realized that something must be done to relieve the handicaps which modern conditions have placed on parenthood. As Mr. Forman showed recently in THE INDEPENDENT (June 20, p. 1377), the factory legislation of England had the unexpected effect of reducing the number of the children it was designed to protect. When children cease to be profitable, the tendency is to cease their production. The Chancellor of the Exchequer, Lloyd-George, in the insurance bill now pending in Parliament, provides a maternity allowance of $7.50 for the wife of an insured workingman. That the situation is serious is evident from the vital statistics of England and Wales for the quarter ending September 30 last, when the birth rate was 10 per cent. less than the average of the last decade, and the births exceeded the deaths by only 81,645.

The French, being a most economical people, have gone farthest in curtailing expenses by dispensing with the luxury of children. As a result, the population of France showed an excess of 34,869 deaths as compared with births during the year 1911. There is no decrease in the marriage rate. M. Messimy, former Minister of War, advises the Government to pay a premium for every child born of the same mother beginning with the fourth, since it requires more than three children per married couple to keep up the population. The premium he puts at $100, half to be paid to the mother at the birth of the child and half put into a fund to provide her a pension for life. To raise the money he proposes a special tax on bachelors or on the heads of families without children or with only one. This is certainly a fair thing. Another attempt to solve the same problem without state aid is the erection in a suburb of Paris of workingmen's flats where the birth of a child relieves the family of the payment of rent for the following week. This is different from some New York tenements, where the birth of a child is penalized by eviction.

In Colorado a bill for subsidizing motherhood is to be voted upon in November by the people of the State, and, since women there have a vote, it is quite likely to carry. It provides for regular cash payments to widowed or needy mothers with children to support. This is merely following the example of the first Christian emperor, Constantine, who in the year 315 decreed that assist-

ance should be given from the public treasury to parents too poor to support their children, in order to put a stop to the practice of killing newborn children or selling them into slavery. Since then the race has made a sufficient ethical advance, so that voluntary infanticide is not to be feared, but otherwise the civilized world is in a state not unlike that of the Roman Empire, when owing to various causes, such as the raising of the standard of life, celibacy and childlessness became so common that bounties and penalties of all sorts were devised to check the tendency.

Whether such legislative expedients as were tried in Rome and most other countries at some time in their history did any good or not it is hard to say, and still harder to say what will be the effect of the modern efforts of which we have given a few casual examples, altho we recognize their good intent and believe them to be a step in the right direction. The difficulty is that here, as in many other cases, the claims of charity and of eugenics come into conflict. The law aims at two targets and they are not set in the same direction. Considered merely as a form of poor relief, any such measures will undoubtedly do good. They will relieve working women in part of the burden of self-support at a time when all their vitality is needed for more important purposes. They will often, in the case of widowed and unmarried mothers, prevent untold suffering and despair. Even to families sailing with the plimsoll mark high above the water, a few dollars or a few shillings will prove very handy in such an emergency. A state calling itself Christian can hardly do less and ought to do more of such relief.

But when we come to the other aspects of the question, the value of such legislation is more than doubtful. For what is wanted, after all, is not more people, but better people. Even France does not need a greater population unless for the purpose of fighting Germany or filling up the African colonies. Certainly it does not need an increase of the population recruited from the most thriftless class of the community. But the measures of maternity assistance now being considered in various countries are none of them generous enough to secure any material increase in the number of children from the men and women who are best fitted to become the parents of the coming generation. If these bounty systems have any effect at all it will be to increase the proportion of the population derived from parents below the average in ability, energy and self control; in other words, it will tend toward degeneration. We do not mean to take income as a measure of superiority, but, however unjustly wealth is now distributed, it is undeniable that paupers and those so near to the pauper line that a few dollars will make a difference in the life of a child are not those whom an intelligent breeder would select if he wished to improve the race. It would, in fact, be more profitble for the state to pay $5,000 apiece for children which a competent committee of physicians pronounced to be of superior heredity, health and promise, than to pay $5 apiece to all comers. But to get superior children one must appeal to some higher motive than the hope of pecuniary reward. To reconcile these two diverse aims, that of helping the most needy and of getting the best babies is the most difficult as it is the most important problem that the modern statesman has to solve. It cannot be accomplished by the blind offer of a bounty, however large. No legislator can offer a higher reward than did Mohammed, who promised that the father of ten children should have a free pass to Paradise. He said nothing about the mother or mothers of the ten, because women, having no souls, cannot enter Paradise unless it happens that their husband prefers them to the houris there provided. But even from Islam we now hear complaints of a failure of population, perhaps owing to skepticism as to whether the promised reward has ever been paid. At any rate, this experience does not encourage confidence in the bounty system for the raising of the birth rate.

The Military Craze

The House of Representatives has refused to make any appropriations for the customary two new Dreadnoughts this year. The Sen-

ate insists on two battleships. Congress is deadlocked. The yellow and pink press, the Navy League, Admiral Mahan, Secretary Meyer and the Republican platform all clamor for two battleships. THE INDEPENDENT hopes that the House will resist the pressure. Not only will such non-action save the country all told some $50,000,000—a tidy sum in these days of high prices—but it is good policy as well. The only nations in the whole world against whom we might conceivably need a great navy are England, France, Germany and Japan. A little navy is sufficient for the others. England, France and Germany are on record as being willing to sign arbitration treaties with us in which all questions shall be submitted to arbitration. Whenever the Senate is ready we can negotiate them. We speak with confidence when we aver that Japan is likewise prepared to enter into such an unlimited treaty whenever the time is ripe. If any one doubts Japan's friendliness toward us let him remember how Japan last year consented to a modification of the Anglo-Japanese alliance so that, in case of war with us, England would not have to choose between breaking her arbitration treaty with us or her alliance with Japan. Surely Japan would never have renounced the possibility of England's aid if she had expected any trouble with us. Even more absurd is the cry now suddenly being raised by Admiral Mahan and the Navy League that the Panama Canal, when completed, will render it necessary to build more ships than ever. They never dared use that argument when the Government was hesitating about digging the canal. Then the burden of their song was that the canal would *double the efficiency of the fleet.* The truth is there are certain navy-crazy interests in this country, always talking about impending wars, tho they cannot, when pinned down, name a single great Power that has the remotest intention of fighting us. When they are finally driven back to the argument that the navy is the cheapest form of national insurance, they never yet have answered the question, Why should the rates of insurance keep going up when the risks are going down. And now the army people are catching the fever. A special despatch from Washington, dated Sunday, states that the General Staff is going to urge the country to increase the army sevenfold. The need is "imperative" if we would "face a first-class Power." Two things ought to be done. First, our peace societies should put Detective Burns on the trail of these war mongers, so that the country can learn what interests, commercial or military, are lurking behind them. Second, President Taft should appoint at once the Peace Commission authorized by Congress two years ago, the members of which he has never yet designated, for some reason not known to the general public. As the House of Representatives has just extended the time of the commission, the Senate will doubtless concur. We need a thoro, impartial and official investigation of the whole armament matter, so that this Government shall have light on the question of what is an "adequate" army and navy. Until such a commission offers plausible arguments for a greater army and navy, we urge all friends of peace and industry to oppose any further military increase and to give their support to the House of Representatives in its present commendable course.

Parcels Post

Senator Gardner, of Maine, has proved himself to be one of the most aggressive workers for parcels post and postal express. He tells us that since his election he has felt that his first duty as a Senator was to secure cheaper rates for small packets, cheaper than the express companies exact at present. The amount now paid "per ton for small parcels is over $31," while the freight charge for the same material "is less than $2." In other words, express charge is sixteen times as great as that of freight. In other countries it is only five times as great. In England the average charge for a ton is 85 cents, and the expressage for the same a little over $4. This means that Americans are paying four or five times as high for service as they pay in Europe. This brings us face to face with the parcels post, as "a question of fair service." Senator Gardner warns us that several of the bills before Congress do not give us cheaper rates at all, and at least two of them greatly increase the

cost of carriage. To the question, What is the remedy? he answers that the bills offered are for the most part an outrageous hoax. He believes that the only possible remedy is the elimination of the parasitic express companies. He argues that the Government should take over these companies at a fair valuation, should reduce their rates by about one-half, for all shipments, and then extend the service, thru rural delivery, to the farmer and the country store. Economic studies of the subject show that the present rates charged by express companies could be reduced from one-third to two-thirds safely. Besides this, we have the rural free delivery system all paid for in advance, thru which we can work. Of course, Senator Gardner means that the shipment of small parcels of farm produce can go directly to the consumer. Farm products, for which the farmer received last year $6,000,000, sold to the consumer at $13,000,000, and this was because there is no direct transportation from the farm to the kitchen. We do not undertake to endorse Senator Gardner's proposition, nor to combat it. If we take over the express companies, and couple town delivery with rural delivery, and both with the railways, the consumer everywhere could buy and obtain direct from the farmer at farm prices; and the great object of American business would be to feed the people, and not to fatten the tradesmen. Of course, the order made this week by the Interstate Commerce Commission requiring the express companies to reduce their rates 15 per cent. is a palliative and does not go to the root of the matter.

Educational Politics

The "Progressives" won in the Chicago convention — not of the Republican party, but of the National Education Association. It is unfortunate that the newspaper reports and the attention of the delegates should have been so largely absorbed in the contest for leadership. In an association of this kind, the purpose of which is conference instead of action, it makes little difference who is the presiding officer, so long as the leading representatives of various educational ideals can present their views at the convention and get leave to print in the bulky volume of the proceedings. The president-elect, E. T. Fairchild, Superintendent of Public Instruction in Kansas, is a good man for the place, but his election is not due so much to a spontaneous recognition of his merits as to the fact that Mrs. Ella Flagg Young, Superintendent of the Chicago Public Schools, threw the weight of her powerful political machine in his favor and against his rival, Miss Grace C. Strachan, District Superintendent of Schools in New York City, whose chief claim for the honor was the magnificent fight she made for equal pay to the women teachers of New York. That the Mayor of New York should have written a letter to the Mayor of Chicago, asking him to support the candidacy of Miss Strachan, indicates the political importance which now attaches to the presidency of the association. Ever since the overthrow of the Old Guard at the Boston meeting two years ago, the defeated faction has alleged that the election of Mrs. Young on that occasion was due to packing the convention with delegates whose membership fees were paid by others for the purpose of securing their votes and who did not come from the schools they claimed to represent. These charges were brought forward by the secretary of the association, Mr. Shepard, and the board of directors at Chicago devoted an exciting session of four hours to their consideration. It was admitted by the leaders of the Young forces that the fees for active membership had been in many cases raised by the schools which the teacher represented, and which were designated to receive the proceedings, but the directors decided that there had been nothing worse than a violation of technicalities, and voted that the charges be "expunged from the records without impugning the motives or impeaching the character of any one." Let us hope, then, that the hatchet will stay buried. This is the first time, we believe, that Kansas has been honored by the presidency since 1891, when Prof. James H. Canfield, of the State University, was elected and promptly got into hot water owing to the accidental publication of an indiscreet letter of his wife's, criticising the Southerners for their treatment of the negro.

Universities of the British Empire

A unique congress has just been held in London, a conference of representatives of all the universities of Great Britain, Ireland and the dominions beyond the seas, for the purpose of securing something of that mutual acquaintance and co-operative effort which in the United States is attained by the two university associations and in Germany by governmental control. The papers and addresses seem, to judge from the abstracts published, to have consisted largely of glittering generalities and platitudes: some of them, indeed, could hardly be called glittering. One of the speakers, however, did venture to disturb the tranquillity of the occasion by a bit of heresy, Mr. Stanley Leathes, First Civil Service Commissioner, who in discussing university training for the public service objected to giving so much time to mathematics, philosophy and political economy, as tending to lead the mind away from the concrete into an unreal world. His objection to the last of these is curious enough to be worth quoting:

"Political economy is perhaps the most dangerous branch of philosophy. A light top dressing of political economy supplies the student with false laws, misleading half truths and erroneous views of human nature, which either disgust him with this so-called science, or blind his eyes to the truths of life, perhaps forever. Young men, indeed, are not fit to learn political economy: a mature and independent mind and experience of affairs are needed as a corrective."

The most tangible result of the congress was the proposal, by Dr. G. R. Parkin, guardian angel of the Rhodes scholars at Oxford, to establish a permanent bureau which should collect information about all of the universities of the British Empire and publish a year-book from which young men and women could learn what courses were given and what were the requirements for admission, the cost of living, etc. The bureau would facilitate the exchange of professors as well as the migration of students. The organization of the bureau is in the hands of a committee composed half of representatives of the home universities and half of representatives from Canada, Australia, New Zealand, the Cape, India and the Crown Colonies. That such a source of information is much needed will be appreciated by all who have tried to find out anything clear and definite about the British institutions. The shortest way to get such information hitherto has been to learn German and read *Minerva*.

One of the most valuable cultural influences with the Protestant clergy is found in their clerical clubs, in which they read papers and discuss all sorts of questions with the utmost freedom. We have heard it said that this institution is not familiar with the Catholic clergy; but *The Western Watchman* reports such a conference of the rectors in St. Louis, in which the teaching of the Church was long and warmly discussed, that there is no salvation without her pale. *The Western Watchman* reports it thus:

"It was overwhelmingly agreed that it does not follow from that dogma that all those who die outside the Church go to the hell of the damned; that none is sent to that hell but one who is guilty of an actual mortal sin. Poor savages are scarcely capable of such a sin. Adults who live thru life free from actual mortal sin are like unbaptized infants; and while they do not go to heaven they do not go to the hell of the damned. . . . Eternal exclusion from heaven does not necessarily mean condemnation to the hell of the damned."

Since the time when Jacob's sons sold Joseph into Egypt the Devil's attempts to outwit the Lord have usually ended in his outwitting himself. In certain States of the Union laws were passed to suppress the negro vote, and one of the favorite measures was by a poll-tax qualification. The Houston *Post* shows how this has worked in Texas:

"In Texas we used to have liberal election laws, and the elections were participated in by most of the potential voters. It is not the case now. The poll-tax qualification, which was adopted principally to suppress the negro vote, has had the effect of barring two white men to every negro delinquent. There are men in Texas at the present time seeking a further suppression of the voters. As the poll-tax qualification bars most of the negroes, the additional 'safeguards' are intended to take the ballot away from white men."

Tho peaceably disposed in general, we are glad that at Stockholm Uncle Sam has demonstrated his ability to "lick all creation."

Lorimer has gone. Who next?

Insurance

Proposed New Mortality Table

At last year's meeting of the National Convention of Insurance Commissioners, the Committee on Rates of Mortality and Interest of that organization submitted a report suggesting that the Actuarial Society of America take up the matter of a new mortality table covering the general experience of the companies among normal lives. The committee observed that the American table, which is the present standard in most of the States, while it has served its purpose well, was constructed fifty years ago, and that perhaps a comparison with experience accumulated since would be most valuable and instructive.

Later in the year the Actuarial Society appointed a committee to prepare a report that would embody the attitude of the society on that subject, recognizing that, altho the actuaries' table is not adapted to the experience on insured lives in North America, and that altho the American table is based largely on the statistics of but one company and the judgment of a single actuary, it has been practicable and the reserves based upon it safe. The life insurance companies acknowledge that for many years past their experience has been better than that indicated by the American table, but such advantages as have accrued have been used in part to defray the acquisition expenses out of mortality savings.

The society's committee, which is composed of Messrs. John K. Gore, actuary of the Prudential Life Insurance Company; Edward E. Rhodes, vice-president and mathematician of the Mutual Benefit Life Insurance Company, and Arthur Hunter, actuary of the New York Life Insurance Company, reports that the society is now engaged upon two very important tasks which must be completed before another can be undertaken, and that it is very doubtful whether sufficient funds could be procured at this time from the companies to meet the heavy expense involved in collecting the data for a new table.

The committee then proceeds to discuss several features connected with the proposal for a new mortality table, one of which is particularly interesting. The idea prevails that a new computation of the combined experience of the companies, admittedly more favorable than that indicated by the American table, would result in lower reserves. Such a result, these actuaries say, is unlikely. They assume for purposes of discussion that the later experience would show a death rate ranging from 40 per cent. of the American table at the youngest age to 90 per cent. at the oldest age. These figures are believed to be larger than the actual will prove to be. An hypothetical table of mortality is then constructed, running by decenniums from age 10 to age 90, showing the experience under the American, the British and the "Modified American." We will cite age 40 only. Under the American the rate is 9.79; British, 9.15; "Modified," 6.86. We now take the 3 per cent. reserve at age 40 on an ordinary life policy and we find it to be, under the American table, $757.78, and under the "Modified," $753.13. Very small difference.

The committee also asserts that a new table, showing a more favorable death rate, would not necessarily reduce the cost of insurance to policyholders, because "this cost is determined by the expenses of management and by the death rate actually experienced, and not by the death rate shown in the table used for computing premiums and reserves." This is obvious. Policyholders pay only the net cost, the initial premium expense being reduced by the subsequent receipt of annual dividends.

The committee concludes that the time is not propitious for immediately undertaking the work of constructing a new table, but expresses the belief that such a table, combining the experience of the companies in the United States and Canada, is desirable.

Financial

A Favorable Crop Report

THE Government's crop report, issued on the afternoon of the 9th, had been awaited with much interest. On the whole, it was a very favorable one, especially with respect to corn, oats, barley, potatoes and hay. The winter wheat shortage had been known for some time, and now the spring crop, exceeding last year's by 80,000,000 bushels, promises to make the total 8,000,000 bushels larger than that of a year ago. The fine condition of almost all of the growing plants is noticeable; in nearly every case the percentage is considerably above the ten years' average. Oats, now 89.2, were 68.8 a year ago; hay, now 85.2, was 64.9 in July, 1911. The corn area has been increased by 2,300,000 acres, and the flax area by 8 per cent. A barley crop exceeding last year's by 20 per cent. is promised. A gain of 100,000,000 pounds of tobacco is indicated. Condition and acreage point to an oats crop larger than last year's by 217,000,000 bushels. Below are shown the quantities now indicated and the quantities harvested in 1911:

	Indicated, 1912	Harvest, 1911
Corn	2,811,000,000	2,531,458,000
Winter wheat	358,000,000	430,656,000
Spring wheat	271,000,000	190,682,000
Total wheat	629,000,000	621,338,000
Oats	1,139,000,000	922,298,000
Rye	34,032,000	33,119,000
Barley	194,000,000	160,240,000
White potatoes	352,000,000	292,737,000
Tobacco, lbs.	1,009,000,000	905,109,000

Abundant crops of corn and oats will tend to reduce the price of meat. We have been importing potatoes, owing to last year's short crop; a yield larger by 60,000,000 bushels, or 20 per cent., is now indicated. Hay was a short crop. The price was high, and considerable quantities were imported from Canada, where there was a surplus. This year, with high condition, there will probably be a good crop of hay in our own country. The yield of the five leading cereals promises to be 4,800,000,000 bushels, against about 4,270,000 in 1911, and the Government says that prices paid to our farmers on the 10th inst. for crops representing three-fourths of the value of all crops, were higher, on the average, by 17½ per cent. than those paid just a year ago. Possibly they are more fortunate than the consumers. A supplementary report has shown that the condition of a large majority of the vegetables and small fruits is high.

All this is encouraging. And it may be added that the Steel Corporation's unfilled orders were increased in June; that these orders on hand represent about six months' work; and that there is to be no summer suspension of work in the steel mills of the Pittsburgh district this year. The decision that work shall be carried on there without suspension is almost without precedent. It is expected that the record for output in the steel industry will be broken this year, and the condition of this industry is regarded by many as a trade barometer.

....At the recent annual convention of the League of Building and Loan Associations, in Atlantic City, it was shown that there are in the United States 6,099 associations (an increase of 230 for the year), with 2,232,829 members, and assets amounting to $1,030,687,031. Pennsylvania, with 1,570 associations and 443,180 members, leads in the list of States, Ohio is second, New Jersey third, Illinois fourth, and Massachusetts fifth.

....An American-British combination will erect packing houses on a site on the Brisbane River in Australia, at a cost of nearly $2,000,000, expecting, it is said, that after the completion of the Panama Canal they can build up a considerable trade in chilled meat with the United States.

....Automobiles do not appear to have reduced the number of horses in this country. The Department of Agriculture say there were 21,203,901 in 1900 and 23,813,850 in 1910.

The Independent

VOL. LXXIII NEW YORK, THURSDAY, JULY 25, 1912 No. 3321

Survey of the World

National Politics

It became known last week that a defense of Mr. Taft's nomination and of the action of the Republican national committee and the convention's committee on credentials concerning contesting delegates would be made in Congress. Senator Root, it was said, would speak in the Senate, and Representatives Bartholdt and Mondell in the House. There will be replies, it is expected, from Senators and Representatives who opposed the nomination. Mr. Roosevelt disagreed with Mr. Flinn and two or three other supporters of his party as to the course to be taken in Pennsylvania and elsewhere with respect to electors. It was proposed that in Pennsylvania and Maryland the electors should vote for Mr. Taft or for Mr. Roosevelt, their action to depend upon a popular majority cast for one or the other. Mr. Roosevelt would not assent to any agreement which recognized Mr. Taft as the candidate of the Republican party. He said:

"I claim that in every primary State where the primaries were carried for me, and where electors have been nominated, that as a matter of the highest moral obligation those men are bound to vote for me, for I am the nominee of the overwhelming majority of the rank and file of the Republican party, and Mr. Taft's nomination represents nothing but the successful dishonesty of the Barnes-Penrose-Guggenheim machine, and is not binding on any honest Republican. In certain of these primary States, as I understand it, there is now a contest on in the primaries to see whether my name or that of Mr. Taft shall be put on the regular ticket instead of being nominated by petition, it being the intention of the party beaten in the primary to nominate its electors by petition. This is all right and proper; but so far as I have any say in the matter I shall not assent to any arrangement by which under any circumstances my supporters or electors supported by them shall cast their votes for Mr. Taft."

In Kansas a judge has issued a temporary injunction restraining every county clerk in the State from printing on the official primary ballot, under the head of "Republican Party," the names of those candidates for Presidential electors who have openly declared that, if elected, they will vote for Roosevelt. In several other States complications have arisen and probably will be taken to the courts. Several State conventions to choose delegates for the Roosevelt national convention were held last week. In Michigan a convention adopted a platform, the substance of which is printed in our editorial pages, where something is said also about the resignation of Herbert Knox Smith, Commissioner of Corporations, who is assisting in the organization of the new party in Connecticut. Mr. Roosevelt decided that he would make no tour of the Middle Western States before the convention. In his speech on the first day of the convention's session he will make an elaborate presentation of his principles and views. Ormsby McHarg, who represented Mr Roosevelt's interests in connection with contesting delegations in the South, and who deserted the Roosevelt standard after the convention, says he does not think the new party will live, because no enduring party can be built upon the personality of one man:

"If anything should happen to Mr. Roosevelt, this movement would be over. A party to live must have a more substantial basis, so that if one man stubs his toe its usefulness will not be at an end."

Mr. Roosevelt has withdrawn from the Republican Club of New York. The Republican State Committee of New

York, of which William Barnes, Jr., is chairman, has decided that the State convention (to nominate State officers) shall be held at Saratoga on September 25, and has named the State's forty-five Presidential electors. It is reported that a majority of the Republican electors in Wisconsin will vote for Mr. La Follette. ——Governor Wilson desired that the Democratic campaign should be conducted by William F. McCombs and a committee appointed by him. The national committee acquiesced. Mr. McCombs was elected chairman, with power to appoint his associates. These were named at Sea Girt on the 18th, and the campaign committee, virtually selected by Governor Wilson himself, is as follows:

William F. McCombs, chairman; Robert S. Hudspeth, of New Jersey; Josephus Daniels, of North Carolina; Willard Saulsbury, of Delaware; Robert Ewing, of Louisiana; A. Mitchell Palmer, of Pennsylvania; Joseph E. Davies, of Wisconsin; Judge W. R. King, of Oregon; Senator Thomas P. Gore, of Oklahoma; Senator James A. O'Gorman, of New York; Senator James A. Reed, of Missouri; Congressman Daniel J. McGillicuddy, of Maine; Congressman Albert S. Burleson, of Texas; William G. McAdoo, of New York.

The last six were not members of the national committee. To visiting members of the committee Governor Marshall said, on the 16th:

"There are many kinds of Progressives nowadays. One believes in taking the tariff from Iowa products and putting it on Indiana products, and another supports the opposite policy. I am not that kind of Progressive. But if the term means one who believes the Democratic party should meet changing conditions by protecting the people against the special interests, I am progressive."

Congress

The Senate, on the 15th, formally received the House's articles of impeachment against Judge Archbald. Four days later the judge appeared before the Senate, which was in session as a court, and it was decided that he must make answer on the 29th inst.——By a vote of 6 to 3, the House Committee on Elections holds that Theron E. Catlin, Republican, of St. Louis, should be unseated, and that Patrick Gill, his Democratic rival at the polls, should be seated in his place. Catlin's election, the committee decides, was invalid because it was procured by a lavish expenditure of money. His father, a millionaire, spent $13,000 for him in the campaign. The son's majority was about 1,200. His engagement to marry the daughter of ex-Governor Merriam, of Minnesota, was recently announced.—— A resolution introduced by Mr. Bailey, of Texas, and intended to be a rebuke to President Taft, because of his letter to Mr. Roosevelt about the Lorimer case, was passed in the Senate last week by a vote of 35 to 23, 6 Republicans standing with 29 Democrats in the affirmative. It is as follows:

Resolved, That any attempt on the part of a President of the United States to exercise the powers and influence of his great office for the purpose of controlling the vote of any Senator on a question involving a right to a seat in the Senate or any other matter within the exclusive jurisdiction of the Senate would violate the spirit, if not the letter, of the Constitution, and invade the right of the Senate.

In the course of his remarks Mr. Bailey sharply attacked both Mr. Taft and Mr. Roosevelt. It is said that Mr. Lorimer will seek an election to the House.—— All but two of the Treasury officers mentioned by A. Platt Andrew, formerly Assistant Secretary of the Treasury, as having complained of the conduct of Secretary MacVeagh, have sent to the Secretary letters which virtually contradict Mr. Andrew's assertions. Among these men are Mr. Hilles and Mr. Norton, formerly Assistant Secretaries; Director Ralph, Auditor Kram and Internal Revenue Commissioner Cabell. The two excepted are Comptroller Murray and Treasurer McClung. There are rumors that they will resign. Mr. Andrew says that Director Ralph and Auditor Kram read and approved his letters of criticism, addressed to the President and the Secretary, before they left his hands.—— An agreement was reached in the Senate last week providing for votes as follows: Wool tariff bill, July 25; excise bill, 26th; sugar tariff bill, 27th. This will clear away the tariff measures. It is thought, however, that none of them will be passed, because the Republican insurgents are no longer in alliance with the Democrats.——The House has passed a bill creating a Department of Labor, whose head shall be a member of the Cabinet.

Trust Questions The packing companies of Chicago, commonly called the Beef Trust, have published statements showing that a dissolution of the combination has been effected by a distribution of about 350 packing plants, valued at $50,000,000, controlled by the National Packing Company, a corporation in which all of the leading packers had an interest. This disintegration is subject, however, to the approval of the Government.——The inquiry concerning the packing companies which is to be made by the House Judiciary Committee has not yet been undertaken.——Testimony was taken in two or three cities, last week, in the suit against the Keystone Watch Company, or Watch Trust.——It is denied in Washington that there have been any negotiations for a settlement of the case against the Shoe Machinery Company by a dissolution subject to approval by the courts.——The majority report of the Stanley Steel Trust inquiry committee will be a very long one. Intimations as to the character of it have been published. It will call for a dissolution of the Corporation and will propose several bills. These, it is understood, will facilitate legal proceedings against trusts by persons injured, will place upon a trust defendant the burden of proving that its actions are in "reasonable" restraint of trade, will forbid corporations engaged in mining to own railroads or steamship lines, and will provide that directors of corporations that manufacture steel rails shall not be directors of railroad companies.

The Islands General Pedro Ivonet, one of the two leaders of the negro rebels in Cuba, was surrounded by Government troops on the 18th, near El Caney, twelve miles from Santiago, captured and killed. The other commander, General Estenoz, was killed two or three weeks ago. The United States marines stationed near Guantanamo have returned to their ships.——In 1911, Cuba received 38,053 immigrants, 84 per cent. of whom came from Spain and 70 per cent. could read and write. ——In response to a resolution asking for a statement of expenditures on account of the Philippines, President Taft sent a message to Congress, last week, saying that the islands had actually paid for themselves, and that there was a balance in their favor on all items except in the increased cost of the army and the navy. This could not be accurately determined. It was an open question whether the army in the Philippines cost more than it did at home. Direct expenditures for the islands amounted to $3,451,925, and against this was $4,975,747 expended out of Philippine revenues in the execution of the military purposes of the United States, for which the islands had not been reimbursed. The cost of fortifications and naval stations could not be estimated accurately. He added:

"Aside from the direct appropriations of Congress, the expenditures incident to military and naval operations and the support of the United States forces in the archipelago, the Philippine Islands have been in no way a charge against the United States Treasury. In other words, the Philippines government has been entirely self-supporting. Moreover, it has been thruout self-supporting in a larger sense than any other territorial possession of the United States. All expenses attached to the collection of revenues, to the administration of the Post Office Department and of course to the survey of the islands, to the conservation of their resources and to the improvement of their rivers and harbors and to all similar works, which elsewhere, as in Porto Rico, Alaska and the Hawaiian Islands, are a charge against the national treasury, are and have been paid from the revenue of the Philippine Islands."

——Several new cases of plague in Porto Rico were reported last week, the entire number thus far having been 37. Two per cent. of the rats examined there were found to be infected. There was no surely identified additional case in Cuba.

Mexico Last week's most exciting revolutionary events were not in the north, but in the neighborhood of the capital. On the 20th, 500 men of Zapata's bandit army attacked a passenger train at Parres, near the edge of the Federal district, on the road from the capital to Cuernavaca. On the train were about 75 civilian passengers and 50 soldiers. By exploding a mine under the track the locomotive was overturned. The travelers could then make but little defense and 84 of them were killed, 43 of these being soldiers. The Zapatists killed several who were disabled by

wounds. Then, pouring oil on the cars, they destroyed them by fire, and some who had been wounded perished in the flames. Women had been shockingly abused, then killed and subjected to horrible mutilation. A few days earlier, 60 Zapatists perished in a battle in Guerrero. Federal troops were ambushed in Oaxaca, and 40 of them killed.——In the north there were no battles. Orozco remained in Juarez, but nearly all of his men had gone westward, tearing up the Mexican Northwestern Railroad as they proceeded. Huerta was advancing slowly toward Juarez. Rojas, with 2,000 rebels at Madera, started a mutiny, threatening Orozco and demanding a share of the wealth the latter is said to have acquired. When Orozco sent General Campa to destroy the railroad, Rojas put him in prison. But Campa was released two or three days later, and Rojas moved westward, intending to reach the Pacfic coast. There was no opposition, altho Sanjinez, with 1,100 Federals, was not far from Rojas. The rebels lived upon the country, and took everything they could lay their hands on. Federal soldiers in Sonora were deserting. On the 20th, Emilio Vasquez Gomez, formerly a member of the Cabinet, and recently (by his own proclamation) rebel Provisional President, was arrested, with three of his associates, in San Antonio. The four were locked up charged with violation of our neutrality laws. They had been plotting in Texas. Large quantities of arms, from St. Louis, Kansas City and New Orleans, it is said, had been sent to them and smuggled across the boundary at Laredo. ——Cloudbursts have destroyed the cities of Salamarco and Celaya, in Guanajuato. It is reported that hundreds of lives were lost and $20,000,000 worth of property was swept away. In the vicinity of Santa Cruz the crops in a thousand square miles of land are said to have been ruined.

South America

Our Government is exerting its friendly influence to promote reforms in the rubber plantations of Peru's Amazon territory of Putumayo, where the agents of a British company (as shown by the report of an investigation made by Sir Roger Casement) have treated the natives with great cruelty, subjecting them to torture and death. Peru promises to prevent such cruelty in the future. Our Government has sent to Iquitos Stewart J. Fuller, who has had experience in the consular service, and who will visit the isolated territory in question. Peru's Minister at Washington says that the atrocious acts complained of were committed some years ago (not later than 1907); that there has since been a great change for the better; that his Government has sent two commissions to Putumayo, and has appointed a third to recommend measures that will absolutely prevent cruelty hereafter. In London there has been published an appeal for money with which to establish in Putumayo a Catholic mission. Sir Roger and the Protestants who accompanied him say that only by a Catholic mission can the purpose sought be accomplished, owing to the attitude of the Peruvian Government and for other reasons.——In response to a note from our Government, Ecuador has paid a large part of the sum long due for the transportation of troops on the railroad (owned by Americans) from Quito to Guayaquil, and is willing that the remainder shall be submitted to arbitration. Ecuador has also taken steps for the sanitary improvement of Guayaquil, a port noted for the infectious diseases prevailing there, and has asked the United States to loan to her the services of Colonel Gorgas and other sanitary experts, in order that a survey may be made and an estimate of cost be prepared. In January last, Captain Bertolette, of the United States gunboat "Yorktown," and several American sailors died at Guayaquil of yellow fever.

The British Insurance Act

The insurance act, which was described by Mr. Sydney Brooks in the last issue of THE INDEPENDENT, went into effect on July 15, and there will be great interest taken thruout the world in watching the effects of it. When first proposed by Lloyd George it was received with general applause, but the scheme when presented in detail was found to be so complicated and to affect so many interests that a powerful opposition developed and was encour-

aged for political purposes. The measure was intended to be the most vigorous and systematic attack upon disease and causes of disease among the lower classes of the population that any government has ever undertaken, but the doctors united in a determined refusal to cooperate with the Government on the ground that the compensation allowed for medical attendance was not sufficient. Housekeepers also made violent manifestations of their displeasure at governmental interference with the personal relation that was supposed to exist between mistress and maid thru the requirement to put stamps each week upon the servant's insurance card. The Conservative organs openly advocated various forms of opposition and passive resistance, but as the time approached for the act to come into effect they ceased to encourage such violent measures and counseled compliance with the law in the hope of future amendments. One reason for the change of tactics was that Lloyd George with his usual political tact had drawn the fire of the Opposition in the midst of the campaign by a hint that the capitalistic classes were threatened by something more dangerous than anything they had so far suffered from the Liberal Government. The hint of the next step in the policy of the Government was contained in the following sentences from his speech at Woodford:

"Do you know what is in front of you? A bigger task than democracy has ever yet undertaken in this land. You have got to free the land—the land that is to this very hour shackled with the chains of feudalism."

In an interview the Chancellor of the Exchequer explained the part taken by the insurance act in the Liberal program as follows:

"For the first time in the history of Great Britain as a state, employer and worker are now to cooperate to maintain and to increase the efficiency of the individual and of the nation. The workman's insurance act aims to make provision for keeping the household from poverty, to keep the worker and his family from pauperism in the dark days of sickness, which come to every household in turn, and to guard against suffering from unemployment from which the workman is not responsible.

"It will help the mother at childbirth and will inaugurate a great national campaign against consumption.

"Instead of devoting our strength altogether to fighting our neighbors abroad, we are organizing armaments to fight social evils at home.

"And now that the workmen's insurance act will be in full operation next Monday, we intend to put our hands to the great work of freeing the land, which was meant for the use of the many but which has drifted into the hands of a few, freeing it for the people and for their children forever."

That the act is well received by the classes which it is intended to benefit is shown by the fact that by the date when it went into operation 10,000,000 of 13,000,000 persons insurable under it had registered with approved friendly societies in order to take advantage of it. The chief difficulty in the administration of the act is in the case of casual laborers, for whom no employer wants to become responsible. At Liverpool the employers arranged a clearing house scheme where the dockers and similar laborers could have their cards stamped, but the men refused to register there and went out on a strike to the number of 12,000.

Suffraget Disturbances Exasperated at the refusal of the Government to allow the suffrage bill to pass, altho a large majority of the House of Commons voted in favor of it on its first reading, the militant suffragists have become more violent than ever in their methods, and the ministers are thought to be in danger of being killed. Mrs. Henry Fawcett, the president of the National Union of Women's Suffrage Societies, comprising more than 200 of these organizations, has issued a protest against these militant tactics, in which she points out that violence is bound to be disastrous to the cause. But the suffragets of the Woman's Social and Political League, founded by Mrs. Pankhurst, are not to be checked by counsels of moderation. The visit of Premier Asquith to Ireland was made the occasion of unprecedented attacks, from which the large force of police and detectives could not protect him. When he was being driven thru the streets of Dublin with Mrs. Asquith, John Redmond and the Lord Mayor a hatchet was thrown at him, but hit Mr. Redmond instead, inflicting a wound on the temple. The missile was thrown by Mrs. Mary Leach,

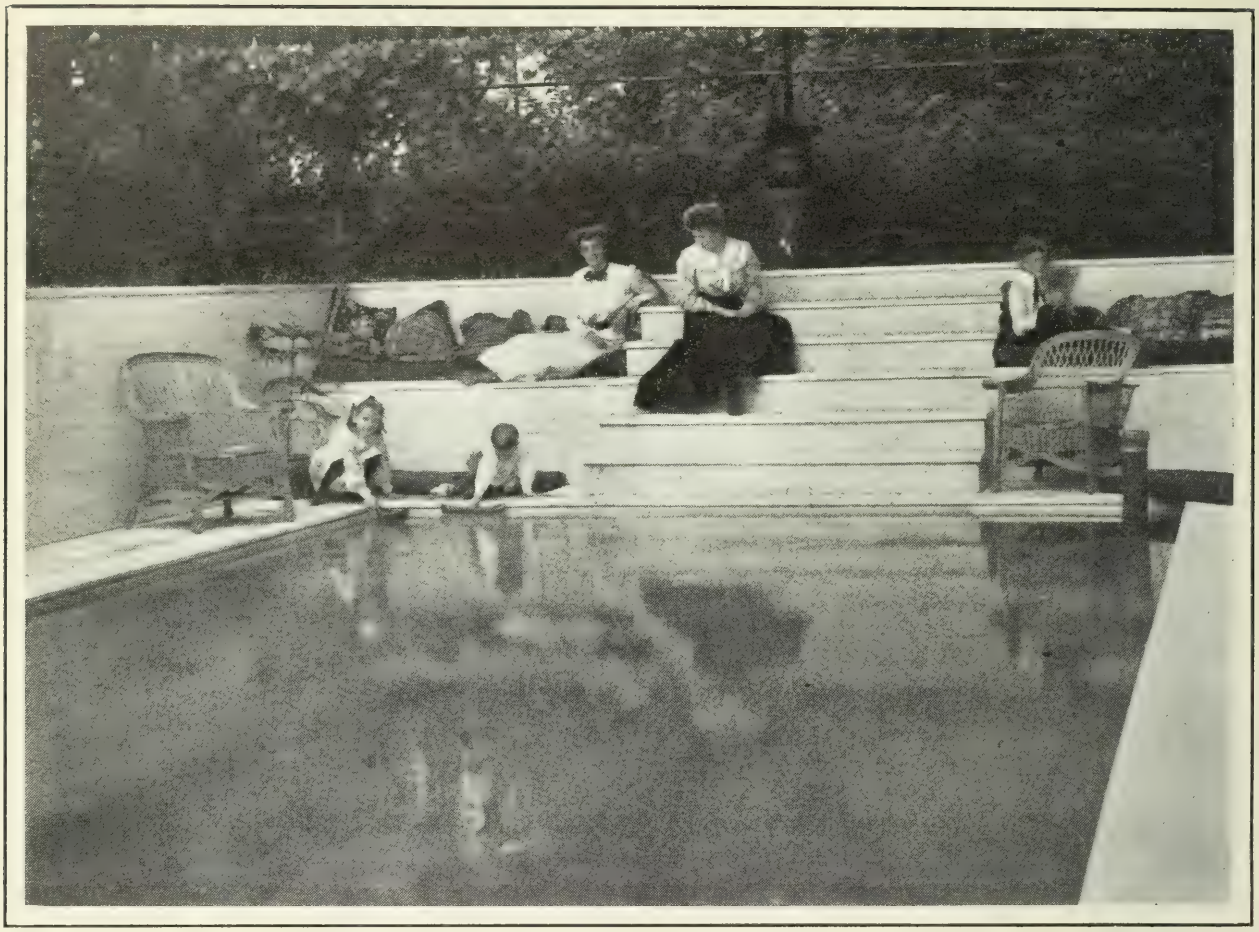
who has been imprisoned eight times for suffraget disturbances. An attempt was made to burn down the Theater Royal, in which the Premier was to speak, by a woman occupying a box, who threw into the orchestra a chair soaked in oil and set on fire. The fire was extinguished, but the curtains were burnt and a panic narrowly averted. A suffraget parade in Dublin on the evening when the Premier spoke was broken up by the crowd, which was about to throw the women into the river when they were rescued by the police. The next day a sack of flour was thrown at the Premier as he passed thru the Town Hall Square in a motor, but the flour fell instead over the men and women standing near. This is the first time that an English Premier has visited Ireland since the union and the people are wild with enthusiasm over the near approach of home rule.

The Olympic Games

In the fifth series of modern Olympic games, concluded at Stockholm July 15, America was a long ways in the lead. Up to the last of the ten days indeed it seemed likely that the contestants from the United States would score more points in the field and track sports than all other nations combined. Counting three points for the first place, two for the second, and one for the third in each event, the final score stood as follows:

Country.	Track and Field.	All Events.
United States	85	128
Sweden	24	104
Great Britain	14	66
Finland	27	46
Germany	4	34
France	4	23
South Africa	5	16
Denmark	0	14
Italy	1	13
Canada	7	13
Australia	0	13
Belgium	0	11
Norway	2	10
Hungary	1	8
Russia	0	5
Greece	4	4
Austria	0	4
Holland	0	2

The King of Sweden distributed the first prizes on the final day, shaking hands with each winner and crowning them with laurel wreaths. The Crown Prince presented the second prizes and Prince Charles the third. Great applause greeted the appearance of James Thorpe, of the Carlisle Indian School, who proved himself the greatest all round athlete of the world by winning both the pentathlon and the decathlon. This gives him the right to hold during the next Olympiad the challenge cups given respectively by the King of Sweden and the Emperor of Russia. In the ten events of the decathlon Thorpe scored 8,814 points out of a possible 10,000, with the following records: 100 meters, 11⅕ seconds; broad jump, 6.79 meters; putting the shot, 12.89 meters; running high jump, 1.87 meters; 400 meters, 52⅕ seconds; discus throw, 36.98 meters; 110 meters hurdles, 15⅗ seconds; pole vault, 3.25 meters; javelin throw, 45.70 meters; 1,500 meters, 4.40 1-10. The Marathon was won by K. K. McArthur, a policeman from South Africa, in 2 hours and 36 minutes. This race, being run in the hot sun over a rough and hilly road course of 25 miles, proved very trying to all and the only Portuguese contestant, P. Lazaro, fell at the end of 19 miles from exhaustion and died on the following day without having recovered consciousness. The high place taken by Finland in the roll of honor is chiefly due to H. Kolehmainen, who won the 8,000 meter cross-country race, the 10,000 meter race, the 5,000 meter race and shorter courses. The next Olympic will be held in Berlin in 1916.



Turkey and Italy

An engagement, the reports of which are contradictory, took place in the Dardanelles on the night of July 18. According to Constantinople cables eight Italian torpedo boats passed thru the strait, but were caught by the searchlights and bombarded from forts and fleet for three-quarters of an hour, sinking two and damaging the others. According to the official version of the Italian Government the flotilla entered the Dardanelles in order to attack the Turkish warships, but finding that they were protected by steel cables, withdrew without suffering any serious injury, "thanks to the enemy's bad gunnery." The object of the maneuver is thought to be to force Turkey to close the

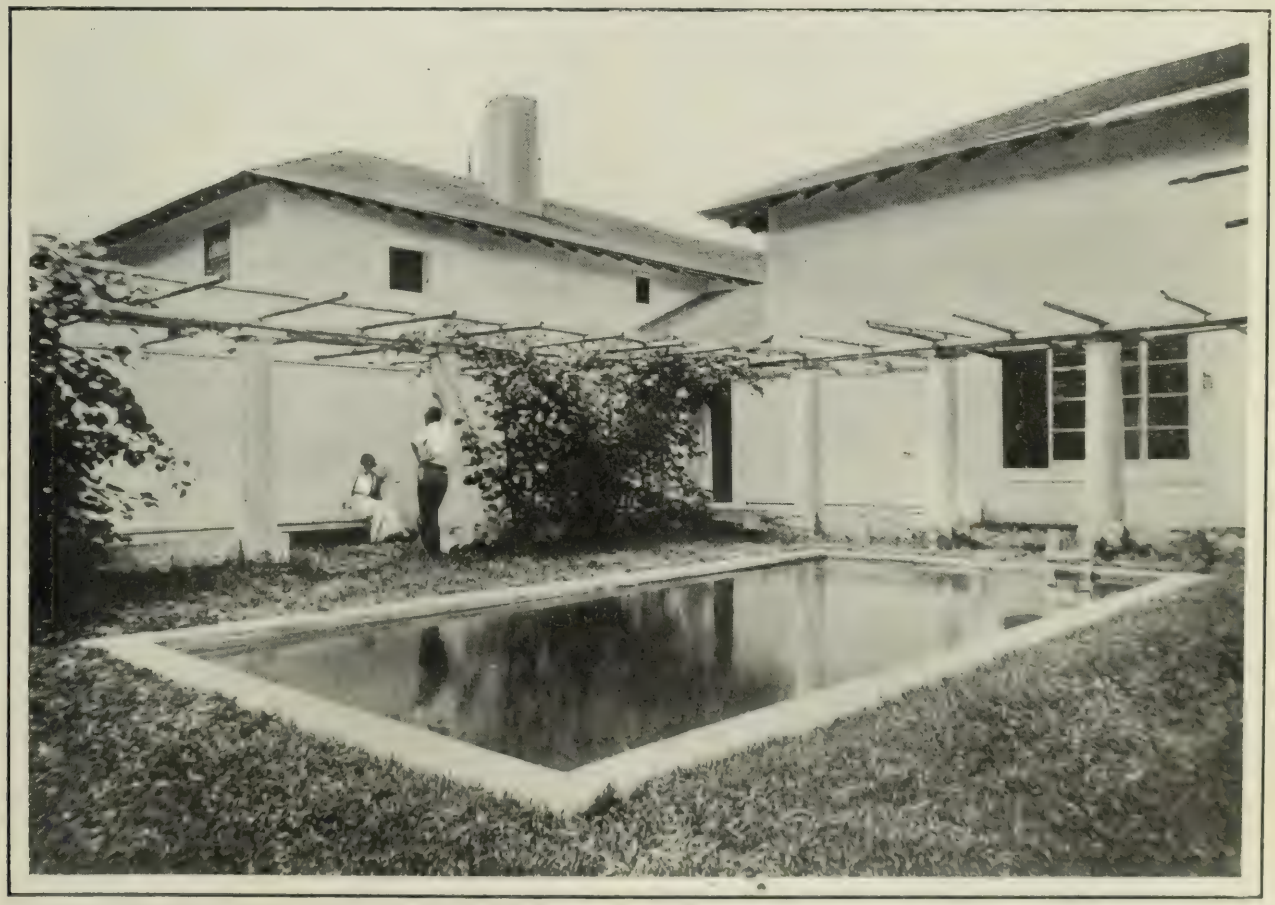
Dardanelles and so provoke the interference of the Powers.——The internal condition of Turkey is very serious. The army has become impatient of the domination of the Committee of Union and Progress, the secret society which instigated the revolution and has ever since controlled the Government from its headquarters at Salonika. In opposition to this organization the League of Military Unity was formed and has succeeded in overthrowing the ministry thru the resignation of Mahmoud Shefket Pasha, who has been Minister of War ever since he entered Constantinople at the head of the revolutionary army and made the Sultan prisoner. Tewfik Pasha, the Turkish Ambassador at London, was offered the post of Grand Vizier, but declined to undertake the formation of a cabinet, except on condition of dissolving the Chamber. Mahmoud Mukhtar Pasha has accepted the position and formed a cabinet. He is said to be in favor of withdrawing the troops from Albania and offering full amnesty to the rebels. The Albanians are becoming continually bolder and now threaten to appeal to another Power for protection. They recently surrounded four battalions of Ottoman troops on the River Kruma, in the vilayet of Kossovo, and captured over 300 of them.

The Chinese Situation

There seems to be a deadlock in Peking in both financial and political matters, if indeed it is possible to consider them separately. The four Powers—Great Britain, France, Germany and the United States—whose proffer of a loan precipitated the revolution, were forced to take into partnership Japan and Russia, and now have completed the arrangements for making a joint loan to China of $300,000,000 or more. This financial group, however, insists upon foreign supervision of the expenditure of the loan to see that it goes to the proper purposes, chiefly the internal development of the resources of China. It is practically impossible, however, for the Government to accept the provision of foreign supervision, since the provinces are as much opposed to it as ever and would probably overthrow any government which agreed to it, even if it involved another revolution. Tang Shao-yi, by attempting to play off one Power against another, lost the confidence of all, and was forced to resign with his other adherents in the Cabinet. Since then President Yuan Shi-kai has not succeeded in forming a Cabinet satisfactory to the National Assembly. He desires a coalition ministry, composed of representatives of various parties, pointing out that it is impossible to adopt the conventional party system in the present chaotic state of the country, and that it is necessary to get a stable government formed as soon as possible in order to secure the recognition of the republic by foreign nations. The Assembly, however, is composed largely of the more progressive wing of Chinese republicans, and they distrust President Yuan and regard his chosen advisers as reactionary. Dr. Sun Yat-sen, who was made Provisional President when the republic was first declared in the South, and who resigned in favor of Yuan in order to make possible a united country, is now coming to the front as a leader of the opposition party. Reports as to the financial condition are conflicting. According to some the Government is so hard up that it will not be able to maintain itself much longer without foreign aid. The army is underpaid and on the verge of mutiny, officials everywhere having difficulty meeting their household expenses. On the other hand, it is announced that there has been a steady increase in the customs collections and in remittances from the provinces. The June collections at Shanghai were the largest ever recorded and will make it possible to wipe out a heavy percentage of the suspended Boxer indemnity at the end of a year or so. Chinese capitalists profess to be able to furnish the Government with all the money it needs without the necessity of accepting foreign loans. Prof. Jeremiah W. Jenks, of Cornell University, has been asked by the Chinese Government to accept the post of financial adviser and he has accepted the position. Professor Jenks some years ago was called to China to devise a system for the reform of finances, but his report was pigeonholed because the Government then in power had no desire to put into effect these or any other reforms.

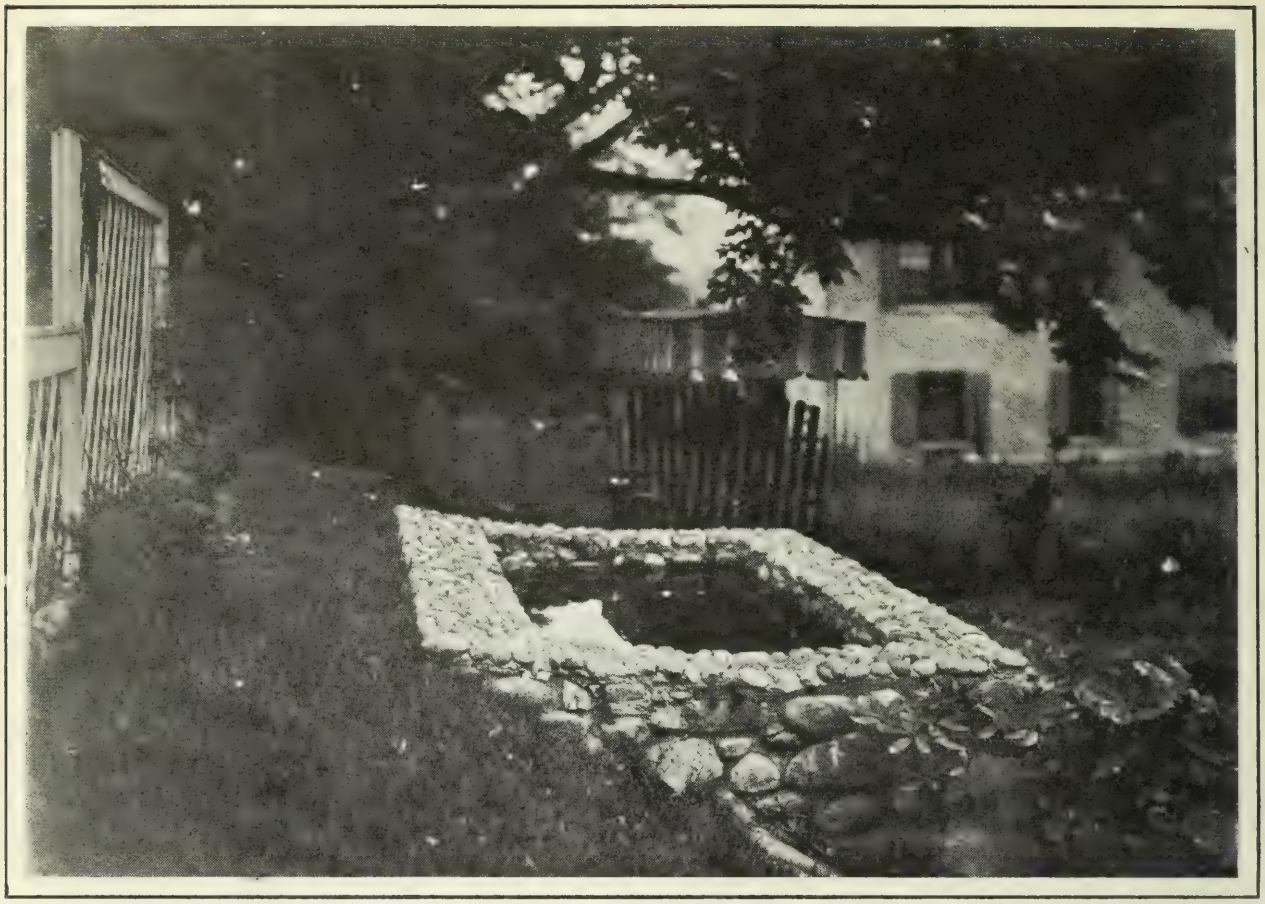
THIS POOL IS IDEAL IN ITS ARRANGEMENT. THE CHILDREN USE IT FOR TOY BOAT SAILING ALSO.

Home Swimming Pools



BY ROBERT H. VAN COURT

THE swimming pool can hardly be said to have attained, as yet, complete recognition of its claims upon the attention of the owner of an inexpensive country home; perhaps it would be more accurate to say that only occasionally does one find this delightful contribution to the joys of country living, tho such pools are vastly more numerous than they were even a few years ago.



Their slow attainment to general use is caused chiefly by the impression that a swimming pool must necessarily be inordinately expensive to construct and both difficult and costly to maintain, and also because they are sometimes thought to be suitable only upon very extensive country estates. These objections, however, are not sustained by the experience of those who have installed such pools on their grounds, for some of the most successful swimming pools are those which have cost the least money, and, broadly speaking, it may be asserted that any but the most luxurious pool may be had for the cost of the garage required to shelter the automobile which almost any one in these days seems able to acquire. The maintaining of a swimming pool is exceedingly simple and the up-keep costs almost nothing if reasonable care be exercised in the necessary filling and draining and in properly protecting the pool during the long months of winter.

Of course there are many places where a swimming pool would hardly be necessary. If one's home be near an ocean

beach, a beautiful lake or some other water course one will not require a substitute of man's invention, but there are many places far inland or removed from any such natural waterway, and for homes in such localities the swimming pool offers many attractions which should be more generally realized. If one's home be near a brook or a small running stream the arranging of a swimming place may be simple, for it means merely the excavating of a space of any required length and breadth and as deep or as shallow as one may desire. The banks, which should slope toward the water, may be sodded and the pool screened by tall growing shrubbery, and the result is the most "naturalistic" of swimming pools, closely related to the "swimmin' hole" dear to the memory of every country boy. A pool of this kind is apt to be some distance from the house and a small shelter or bathing house should be provided for disrobing and dressing. A tiny structure of logs would be particularly appropriate and in keeping with the rustic surroundings. Where this very simple treatment cannot be employed the swimming pool may be excavated in almost any spot desired, walled and floored with concrete or with brick covered with cement, and provided with water from the source which supplies the water used elsewhere in the home. Care must be taken, of course, to provide for properly filling the pool and for an adequate system of changing the water and for an escape or drain to prevent overflow. There are no rules for making such pools, and therefore one may plan and build without doing violence to any well defined architectural tradition. The swimming pool may be of any size and may be either of one depth thruout or of various depths, ranging from perhaps two or three feet at one end to eight or ten feet at the other end, as this would make its use quite safe for even the younger members of the family. If the pool be apart from the house it might be surrounded by trees or a privit hedge, which would form an effective screen, besides adding greatly to its attractiveness by the fresh green of

THIS POOL, IN A CORNISH, N. H., GARDEN OF THIS SIZE, CAN BE EASILY KEPT FRESH AND CLEAN.

A SMALL POOL CONSTRUCTED OF COBBLE STONES AND CEMENT.

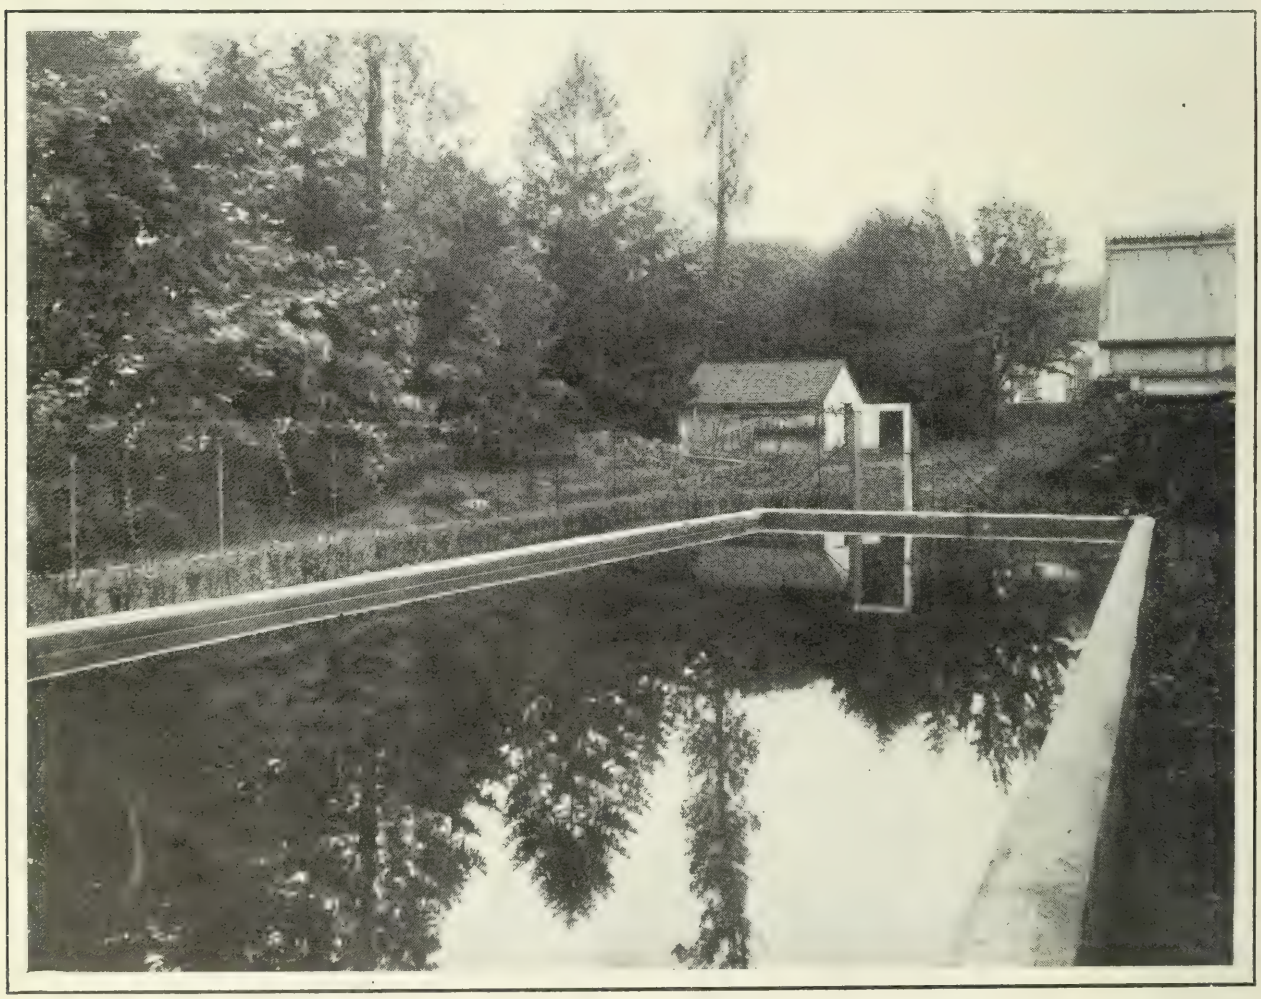
its closely cropped surfaces. The walls of the pool will no doubt rise several inches above the ground, forming a rim about the water, and here again some kind of a pavilion or bathing shelter should be planned for the convenience of those to whose comfort the swimming pool is to cater. A tasteful little structure will add so greatly to the beauty of the spot that securing the proper thing will be well worth the small trouble and trifling expense involved.

The pools which have thus far been built in America are for the most part either in secluded or semi-secluded parts of the grounds, or, at any rate, somewhat apart from the house, but in some few recent cases such pools have been arranged so that besides being quite as practical and useful as swimming pools should be they serve an added purpose in conferring distinction and beauty upon the surroundings wherein they are placed. The horizontal lines of their walls are very helpful in emphasizing the broad spreading effect which architects of American country homes are trying to secure. There is a particular fitness in this, for the low, broad dimensions which just now are so popular in building country homes are, of course, the lines used in the homes of ancient Greece and Italy, where the swimming pool was a well recognized part of the home and frequently a decorative feature of the greatest importance, for it was generally placed in a courtyard or patio and surrounded by a broad loggia, the cool tiled or bricked floor of which came to the edge of the water. The pools which have been built close to homes in America possess something of this architectural and decorative value, for they are generally surrounded by closely trimmed lawns and sometimes shaded by pergolas laden with vines, which do much to carry out the Italian feeling. Nothing gives such an air of freshness and coolness to a spot as a surface, however small, of fresh, clear water, and in a few cases the swimming pool has been made so intimate a part of home life that its concrete edges have been broadened out to form a narrow veranda-like space, approached by steps of stone or concrete and spread with rugs and cushions and

LARGE ESTATES AFFORD ROOM FOR SWIMMING POOLS OF GOODLY PROPORTIONS.

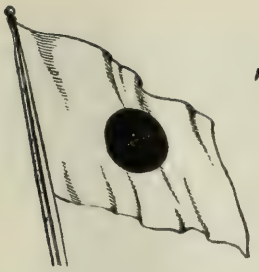
furnished with chairs of wicker, bamboo or other similar material. In these little pools, which are sometimes sheltered by awnings, the children may sail their ships, besides taking their plunges and first lessons in swimming under the eyes of their parents or nurses. There is at least one swimming pool which became so popular and important a part of family life that an arrangement was made for its being covered and heated during the winter months, and it is used and enjoyed by the entire household. The pool is sufficiently large to allow for the use of a tiny boat, and the fun which the swimming pool supplies is out of all proportion to the cost of its construction and maintenance.

Much has been written of late regarding the purifying and protecting of water in swimming pools, whether they be indoors or entirely open to the air. The water, of course, should be entirely removed and the pool refilled frequently and the walls and floor should receive an occasional application of some strong antiseptic. If any disinfectant is considered necessary for the water ordinary bleaching powder or calcium hypochlorite will probably be all that may be required. Water which is stationary, entirely undisturbed by the motion of even a steady intake and outlet, and which is further exposed to the heat of the sun is quickly heated to a degree which renders it particularly favorable to the growth of organic matter, and the taking of every precaution is well worth while, for it means an added value and greatly widened scope to the opportunities for enjoyment which the swimming pool holds out.



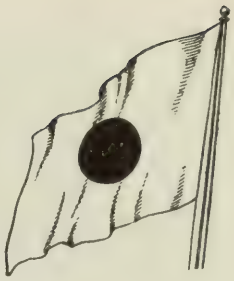
The pleasure of having an open air bathing place of one's own must be experienced to be really appreciated. Imagine going in the fresh, cool of an early morning into a spot shaded by trees or vines and walled in by the greenery of shrubbery or hedges so that it seems to be remote from everything, but is really only a short walk from the house. Then imagine plunging into the pure depths of the clear water and the tingle and glow which follows the first chill—and all this is within reach of every member of the family whose home

possesses even the smallest of swimming places.



The protection of the pool during the winter is of the greatest importance if the walls be built of brick covered with cement. Before the beginning of cold weather the water must be entirely drawn off and the walls allowed to become thoroly dried. If possible a covering of some kind should be arranged that moisture be kept away from the walls, for as such moisture would quickly become ice the walls would be greatly damaged. If the walls be of concrete, which is usually the case, such extreme precautions will hardly be necessary, for they will probably be so thick and so strong that they will not be affected by the freezing of water into ice or its being thawed. The construction of such a swimming pool is very much the same as is used for concrete tennis courts, which are often depressed a few inches and during the winter are flooded with water and used as skating rinks, and concrete building is ordinarily sufficiently strong to be equal to this usage. When preparing the pool for winter or in arranging its use in the spring one should be careful to test the condition of the drain and the overflow, for with a very little care they can be kept free of all obstructions.

Of course the swimming pool, like many other adjuncts of country living, can hardly be regarded as a necessity under any conditions, but it adds greatly to the pleasure of home life and its utility in the country home is especially valuable. It may be regarded as being midway between a source of pleasure and a necessity of life, but upon either score its possession would be amply justified, for its usefulness would be difficult to judge. It would abundantly "pay its way" in the great enjoyment and opportunity for recreation which it would bring to every member of the family.



New York City.

THIS POOL, WHICH IS ON AN ESTATE NEAR PHILADELPHIA, PERMITS AMPLE FREEDOM FOR SWIMMING STROKES.

The Chinese Revolution and the World's Peace

BY COUNT SHIGENOBU OKUMA

[Since the death of Prince Ito, Count Okuma is generally considered the greatest statesman of Japan. He has been Finance Minister, Foreign Minister, Minister of Agriculture and Commerce, Prime Minister and founder and leader of the Progressive party. He is also the founder of Waseda University and the Japanese Woman's University. Since 1898 he has retired from active political life and has largely devoted himself to Waseda University, of which he is still president, and to writing. He is also much interested in the Japan Peace Society, of which he is president. He takes great pride in being the possessor of one of the most beautiful gardens in Japan.—EDITOR.]

THE general tendency of the world today is in the direction of peace. This tendency is more particularly noticeable in the relations between nations that have attained about the same degree of civilization. Such nations are making every effort to avoid war and to preserve amicable relations among themselves. This is a matter for which mankind is to be sincerely congratulated; but if we turn to those regions of the globe that are inhabited by peoples who have not attained an equally high degree of civilization and who on that account lack the necessary power of resistance, the stability of peace is not so well assured. The fundamental cause of the disturbance of peace lies, in my opinion, in the difference which exists in the degrees of civilization attained by different peoples. Wherever a high and a low civilization come into contact with each other, there is always present an element of danger to the maintenance of peace. The effect produced by such contact is similar to what we see in physical nature when a vast expanse of moving water in its forward march comes suddenly to a plane of lower level. The force of the civilization of a higher level precipitates itself upon the peoples of lower civilization who are not equipped with a sufficient power of resistance.

A superficial observer would say that the source of peril to the maintenance of peace lies in the lust of conquest, the insatiable desire for expansion on the part of the great peoples. To my mind this appears to be taking the perspective from the wrong end. In this world today there is not one dominating Power, but a number of strong nations. They naturally act and counteract against one another as checks and balances. The line of vulnerability to the maintenance of peace does not run along the great Powers. That line lies precisely in those regions where peoples of lower civilization can not hold their own in the face of the irresistible force of higher civilization. When the tide of influence of a strong Power commences to flow into regions inhabited by a weaker people, other strong Powers do not merely look on but assert their influence at once. The confluence of such antagonistic forces produces diplomatic eddies and whirlpools. Herein lies the danger to peace. The volcanic eruptions of the diplomatic world do not occur in the midst of strong Powers, but in such regions as the Balkan Peninsula, Africa or China, where the power of resistance is manifestly inadequate. The diplomatic history of Europe for the last one hundred years chronicles many important events; but an analysis of that history will bear testimony to the soundness of my theory. We are confronted with a practical exemplification of this theory in the present situation in China. That country has not even the necessary power of resistance, much less the power to take positive offensive action toward the disturbance of international peace. It is precisely because China is weak that there is the danger of her becoming the vortex of international complications. The whirlpool, if produced, will be the result, not of the action of China, but of the assertion of conflicting influences on the part

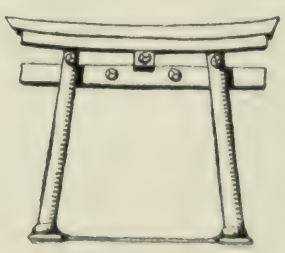
of the Powers. We have already had one of the most convincing demonstrations of this truism in the Russo-Japanese War of 1904-5. Opinions will differ as to the smaller contributing causes. Some will claim that the responsibility for that war rested entirely with Russia. Russians may say that Japan courted that war. The two Powers may, perhaps in different degrees but jointly, be responsible for that ghastly carnage; but there can be no question that in the final analysis that war was caused by the inability of China to move abreast with the rest of the world in the general march of civilization. China has more than one-fifth of the total population of the world. She is a great nation whose written history runs back for thirty centuries. The ability or inability of China to assimilate herself to the rest of the civilized world and thus enter into the Council of Nations will have a determining influence on the maintenance of peace in the Orient, and consequently on the maintenance of the peace of the world.

To all outside appearance the Chinese Revolution has come to an end; but in reality neither in her internal administration nor in her diplomatic relations can we see much light ahead. Indeed, China will have to steer thru the darkness of night and over rough seas and many difficult passages before she will come to discern the light of peace. Should the Powers in the meantime attempt to satisfy their territorial ambitions at her cost and take actions tending toward the dismemberment of that vast empire, complications, the results of which cannot be foreseen, will ensue.

Of course, there are many "spheres of interest" in China preëmpted by various nations. Beginning at the north we have the Russian "sphere of interest" all thru Mongolia and north Manchuria, while Japan has obtained various concessions as to control and construction of railways in south Manchuria. Tibet has long been considered as a British "sphere of interest," tho under the convention of August 31, 1907, Great Britain and Russia agree not to enter into negotiation with Tibet except thru the Chinese Government, nor to send representatives to Lhasa. France and Germany have also gained an industrial foothold within Yun-nan and Shantung, respectively. Thus the international relations in China seem to be extraordinarily complicated. But so late as until today, none of these nations has displayed any ambition for territorial expansion; they are all struggling only for commercial gains. Therefore, if their commercial ambitions are not deterred, it is not difficult for China to keep the whole empire from breaking away. Mongolia and Tibet are reported to have proclaimed independence. But they did not mean permanent separation from the Chinese Empire. If their interests will be well protected and their desires well attended, they will fondly come back to the mother country, with whom they have had political and social relations for centuries past. There are some who urge that Mongolia and Tibet should be made "neutral zones" between China and Russia and Russia and Great Britain, respectively. In case that Mongolia and Tibet should remain outside of the empire, it may be a safer way for the preservation of the "balance of power." But is it not more desirable to have China restored all her territories under her wings and see that vast empire entering upon a marvellous career of industrial development?

During the period commencing in 1884 and terminating in 1892 the Powers of Europe divided Africa among themselves. That allotment was accomplished without serious difficulty, because by far the larger portion of the dark continent was not the abode of man at all or was inhabited only by wild savages. In China, if the Powers were to make a similar attempt, they will have to deal with entirely different conditions. That country has a population very nearly equal to that of the whole of Europe with a highly developed form of civilization. To attempt a division of this empire in much the same way Africa was divided among the Powers, is an operation fraught with danger. Such an attempt will give rise to a general clash of conflicting interests among the Powers. Even the preponderant position in Manchuria which Japan had obtained as the result of her war with Russia gave rise at one time to various surmises and suspicions. Indeed it was even rumored that Japan's relations with the United

States were strained owing to the former's failure to observe the principle of equal opportunity and open door in those regions.



If such inauspicious suspicions and rumors can be started with respect to the relations of two Powers which for historic, economic and political reasons stand as close to each other as any two Powers formally allied to each other can stand, it can well be imagined what would be the result if the Powers were to take advantage of the present unsettled state of affairs in China and to make attempts to establish their respective spheres of influence by intervening in her domestic troubles or by despatching large bodies of troops. Unfounded reports would give rise to more rumors, suspicions would breed further suspicions; and the outcome of them all would be to place China on the vortex of international strife. It, therefore, behooves Japan and Great Britain, which of all the Powers of the world have the largest interest at stake in China, to take every possible measure for the preservation of her territorial integrity. For this reason I earnestly hope that of all the governments of the world the cabinets of Tokyo and of London will meet the Chinese situation with the strongest determination to uphold her territorial integrity and maintain the *status quo* in the regions of the Eastern Asia. If the principles of Anglo-Japanese Alliance are asserted in an emphatic and unequivocal manner, there will be no room left for the play of ambition or for the engendering of suspicions on the part of the Powers. There can be no better means of saving China from the impending ruin and of protecting at the same time not only the interests of Japan and Great Britain but the common interests of all nations.

The Government and people of the United States of America, which are so active in promoting all that makes for peace, will doubtless cordially join in the maintenance of the principles of the Anglo-Japanese Alliance. The American people will recognize how mistaken they were when they harbored doubts and suspicions regarding the intentions of Japan toward China and her territories.

If misunderstanding on the part of some of the Americans can thus be cleared and if the present revolution will serve as the key to lead China on the road to moral and intellectual rejuvenation and give an opportunity to Japan to realize her cherished ambition to promote those interests which she has in common with China, then a great misfortune will have been turned into a source of happiness.

The chains of diplomatic volcanoes no longer exist in Africa but only in the Balkans and in China. The Balkan Peninsula seems to be fast approaching a condition which may be compared to that of extinct volcanoes. On the other hand, China is very much like a volcano on the eve of eruption. Should that eruption take place, the disaster will extend all over the world. It is only by leading China on the path of progress that she can be saved from the catastrophe. It is only by that means that the imminent danger to the stability of international peace can be averted. It is, therefore, my earnest wish that the nations of the world shall unite in one common effort to uplift China to a higher plane of civilization. Indeed, the Powers would be lacking in the discharge of their manifest duty if for any reason they failed to make their supreme effort in this mission of peace.

TOKYO, JAPAN.

Work for Women

BY THE BACHELOR MAID

THE past has handed down to us a number of things less worthy of reverent preservation than its mahogany furniture and antique silver, and among them are certain ideas. And of ideas concerning work, both male and female, the inheritance it has left to us is a conglomeration in which some sentiments of solid worth on the dignity of labor (designed rather to be preached than practised, however), mingle with much tawdry and showy rubbish. Especially is this true as to work for women.

This "womanly" rubbish may be divided into two classes. The idea prevails, being kept alive by gallant gentlemen of the old school and their descendants, that the less work a woman can do, the more she is to be considered happy, as is also the devoted masculine creature whose privilege it is to support and encourage her in idleness. The other and still more prevalent notion is that since an absolutely workless state, even for lovely woman, is unattainable in this vale of tears, there are some kinds of work which are both easy for her delicate physique and becoming to her sex, because inherently "feminine." Among these light and attractive occupations are cooking, dishwashing, sweeping, dusting, washing, ironing, mending, sewing, fancy needlework, piano playing (not too well, of course), china painting (also not too well), nursing the sick (unprofessionally, again, of course)—everything, in short, which is supposed to maintain and adorn the home, all enhanced by the additional pleasure and recreation of bringing an infant into the world every eighteen months or oftener. All these things are only womanly and dignified, however, so long as a woman receives no wages for them. Domestic work is "menial" if done for a definite wage, but a glory and crown of honor if only paid for in food and clothes.

The result of this widespread obsession is that the vast majority of women have always worked very hard, but with no great joy or profit from their work, since it has generally not been recognized as work at all, but merely as incident to their loving "protection." I never know whether to laugh or to cry when I see one of these "petted" and "sheltered" drudges loyally protesting against "unwomanly" financial independence, and even pitying "the poor working girl," *i. e.*, the stenographer, the shopgirl and the grade school teacher. For, granting that the conditions under which many of these latter earn their living are in great need of improvement, that those under which women wageworkers of lower grades earn theirs are often pitiable and even abominable, almost any one of them is better off, in my most earnest belief, than those *of the same social rank* who are staying at home living upon what a husband or father or brother sees fit or is able to give them. What I have italicised in the preceding sentence seems to me an important consideration usually disregarded. It is very easy to prove the disadvantage of wage-earning for women if you place the overworked, underpaid, usually vulgar, sometimes immoral factory girl over against the fairly educated daughter of parents of comfortable means, who stays at home with her mother. Naturally, the latter enjoys more material comforts, *perhaps* she is the better girl. But such a comparison is as absurd as to try to estimate the relative merits of the potato and fine gold. There can be no comparison of things not in the same class.

I have for some years had a class in what ecclesiastical aristocracy is pleased to term a "mission" Sunday school, inasmuch as the pupils live in a district and mostly wear a garb less fashionable than the teachers. A good many of the girls, as soon as they reach the legal age, go into the factories in the neighborhood. I think I may say that they are

invariably not only better mannered and better dressed, but fresher, healthier and happier looking than their companions who are not thus employed, or who give up employment early to marry the swains of their social circle. Indeed, nothing has struck me as more pitiful than the early and hideous aging of the women of this class who marry young; the loss of teeth, the ugly thickening and discoloration of skin, the stooping, ill-shaped forms, of these women under thirty, but often mothers and "home-keepers" (!!) of ten years or more. Certainly I would rather Maggie McIntyre had stayed in school instead of going into a cigar factory at scant fourteen, but when I see what four years of cigar factory have done for Maggie, and what a few years of married life have done for her slightly older sister, I think it better to graduate from the sixth grade of the grammar school into a factory than into early wedlock and "a home."

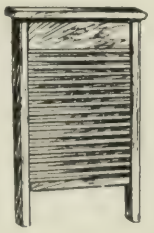
But my particular concern is not with shop and factory girls, but with the class of women I know better, the women who "do not need to work." I am constantly astonished when I see how commonly persons who ought to know better put the whole question of women's employment outside of the home upon the basis of *money*. Undoubtedly many of the women workers themselves are responsible for this, since they frankly declare that they would not work for wages but for their urgent need of the wages themselves. But when it is always from the least intelligent—but most vocal—women that these sentiments come, it seems unfair that the women who work for love of the work should be branded by the same sordid mark.

The trouble with the less intelligent who "hate their work" is apparently much more that they have let themselves be influenced by an all-pervading public opinion into a hostility toward the work than that there is anything especially unpleasant in the work itself. There is no reason, except that the world lets itself think so, why it is harder or more unpleasant to work in a clean shirtwaist for eight hours a day in an office or six hours a day in a school room than to work in a soiled wrapper for sixteen hours a day in the "little nest" provided by some masculine clerk or stenographer; and precisely that, I repeat, is what the grade teacher or the typewriter would be doing if she were not grade teaching or typewriting. For such young women usually marry at about their own financial level, and considering that "support" by their husbands means the effort of two to live on a few dollars more per month than was previously earned by the woman alone, it is hard to see why the woman who has clean work with fixed and moderate hours should be commiserated, while the one whose round of "messy" household tasks "is never done" is congratulated, except that there is an amazing deal of slush talked and written and believed about the aforesaid "little nest." To be sure, office work and teaching mean subjection to the direction of some one in authority, but they do say that very frequently conjugal felicity is subject to the same disadvantage.

But the stenographers, grade teachers, nurses and all the rest who confessedly support themselves only until a supporter can be acquired, are likely to be of a lower grade educationally, and therefore of lower independent reasoning power, than the women who might and do enter the more learned professions and the broader business life. This being true, it is perhaps not surprising that they take their cue from the popular estimate of the "misfortune" of feminine wage-earning, and never attempt to consider for themselves whether their work does not contain germs of interest and development if they would search for them a little. The higher educated woman has no such excuse. She has the equipment for the kind of work whose reward is in itself, she supposedly has the equipment for reasoning about life's problems. Why do such great numbers of her class shirk both the question and the duty, and live as aimlessly and uselessly as their non-collegiate contemporaries and finishing school grandmammas?

A great many, I think, are honestly fooled by that plausible argumentative humbug—that women of means do harm by entering the wage-earning ranks, because they thus take the bread out of the mouths of poorer women who need the

positions so taken from them. Yet the son of a millionaire or a President is much applauded when he begins business "at the bottom of the ladder" and draws the concomitant salary, thus taking the bread out of the mouth of some deserving and impecunious young man who might have filled the same place and also "worked up." Is competition among men so much less keen, the need of earning a living so much less urgent? The truth is, no business in the world is managed as a charitable institution nor should it be. Civilization's advance demands that places be filled by the persons best fitted for them, not by those who would enjoy the income. As an instance of how much good a wealthy woman does by keeping out of the working world, let me cite the case of a young Southern woman. She was given a musical education of a thoroness adapted to a professional career, she had great natural ability, but it is not in the traditions of her aristocratic family that its women have ever "gone on the stage," much less worked for their bread. She might not offend those traditions by a public "career," she "did not need the money" which teaching music would bring. And she has happened not to marry. So she spends her years in dissatisfied and luxurious idleness on her father's plantation, as unhappy as she is useless, because she has been educated to the point of recognizing the failure of a life that has gained no profit from its talents, but not educated to the point of defying her family's superstitions and putting the talents to use. Of course, however, she has the incomparable satisfaction of knowing that she has not taken the bread out of the mouths of the poor young women who are teaching bad technique and false musical taste to the children of the vicinity.



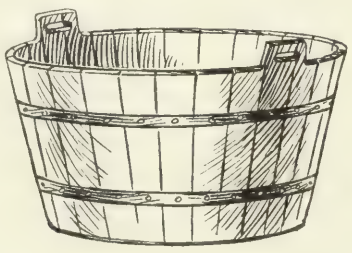
The rich man's son who makes no professional use of his expensive education is one of the commonest objects of our contempt. Somehow I fail to grasp the logic of that sex distinction which makes commendable in the rich man's daughter what we so justly despise in the son. The son, supposedly, so enlarges his business heritage, so expands his field of professional life, that he gives employment to others instead of depriving them of anything. I cannot see that it is other than preposterous to claim that a woman, in developing her own life, does not also by that very act help others to develop.

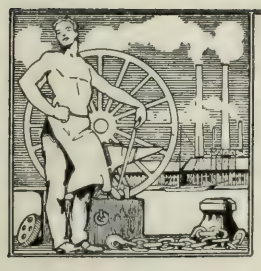
One of the previously mentioned inheritances from antiquity which we have tried hardest to make adaptable to modern use is that the supreme object of woman's existence is motherhood. Our method of adaptation has been to preach that by enlarging and strengthening her own mental life she may pass on to her children that enlarged and strengthened mentality, and so by her "influence," and without conscious departure from her "sphere," contribute powerfully to the development of the race. But of late I think that this supposed happy compromise between woman's "divinely appointed mission" and her higher education has begun to seem unsatisfactory to both conservative and radical. I do not hold the superficial view that a college course is necessarily unused, and therefore useless, because the holder of a degree is not found actually and visibly composing Latin verse, reading Plato in the original, or contemplating the beauties of the binomial theorem. Therefore, I should be far from saying that the woman graduate does not receive and give benefit from her education even if she does nothing more than marry and rear a family. She makes, almost invariably, a wiser wife and mother, and a better loved one, than the woman of common school training and purely domestic accomplishments. She is also likely to be a more valuable citizen, for she usually does take more or less part in useful activities outside of the home. Nevertheless, I believe that the achievement of women graduates in the past thirty years is far from commensurate with the advantages which they have received, and for just one reason; that relatively few of them ever give to personal mental development or social service anything but the scraps of time and energy left over from their home "duties." I cannot believe that even the mother of children is fulfilling the obligation laid upon her by her college course when she is *content* to follow the

intellectual life in the usual desultory fashion, and there is surely fault somewhere, either in her or her education, if college life did not suggest to her some work or study which she wishes to make her dominant pursuit in life, and which is above the inane and profitless occupations of the average woman. It is futile and nonsensical to plead that she finds a worthy line of study in maternal and housekeeping activities. Neither one, as now generally carried on, is in any sense a study or a means of broadening the intellectual life, but quite the reverse. The tendency is to stunt and narrow, thru concentration of interest upon one's own children and home, and the curious result is that the more a woman devotes her attention to the things commonly prescribed as the peculiar functions of the wife and mother, the poorer mother she actually becomes. She is the sort to whom the digestive processes of her children always seem more important than their intellectual ones.

A fair number of educated married women realize this, I think, and that the "home" we sentimentalize over has some marked similarities to a jail; but they do not see a way of escape, for it is true that one such woman in a group of fifty indifferent and lazy ones is nearly helpless. For house and children are very substantial facts, and do undoubtedly leave little time or strength for professional life—unless other women will unite to help.

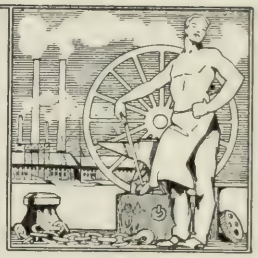
They may help, if they will undertake to make the professional woman as nearly universal as she is now exceptional. In support of that statement it is necessary, I suppose, to define my idea of the professional woman. I do not see why the supposedly fearsome manifestations of the "career" are so commonly thought to be confined mainly to school teaching and going upon the stage. The so prevalent notion that all "careering" females must be either prim school ma'ams or actresses anything but prim, is about as reasonable as the pet delusion of the "antis" that in the event of female suffrage the whole female sex would shortly become either ward bosses or ward bossed. Women have already made their way into a diversity of occupations; my ideal is of a greater diversity yet, with the elevation into professional respectability of many occupations not now so ranked. The tastes of women are naturally as various as those of men; it is a hardship to them and a detriment to society that they are discouraged from following their tastes precisely as men do, with definite educational preparation beforehand and definite work with definite pay afterward. The manifold departments of housekeeping, garment-making, and all the *now* less intellectual occupations of women, might be raised into something deserving the name of profession if intelligent women with an aptitude especially for such things would put their *brains* into undertaking for large social groups what they are now doing with no great profit to themselves and humanity for their own families. The consequent redistribution of feminine labor would relieve of many domestic burdens the women whose preference is for the professions we call "learned," and leave them free to follow them, while the feeding, clothing, nursing, housing, educating and amusing of the world would be much better done than now, I am convinced. When the teachers of domestic science make this their object, and discontinue their drivel as to "training every girl for motherhood and the home," they may prove some right to be the heralds they proclaim themselves of a new era.





As a specific example of a calling for which I think that there is a great field, I would cite that of the trained nurse for babies and little children. I mention this in particular because it seems to contain the answer to what the domesticity standpatters always hurl at one, with an "I'd - like - to - see - you - get - around - that-now" air: "What will become of the babies while the mothers are out following their unwomanly professions?" While mothers of the well-to-do class today are out following social life for as many hours as almost any profession demands, their children are entrusted without a qualm or criticism to any ignorant negro or Irish girl who can be conveniently hired. Will some one kindly state

a real reason why this is a more admirable practice than to give your baby to an educated and responsible caretaker during the scarcely longer time while you do something useful and hardly less interesting than bridge, really? The woman whose means do not admit the employment of a nurse would have about as much time to enjoy her children as now, and see them as well taken care of in a regularly established public nursery while she is occupied with her housework. At present they are left to the care of older brothers and sisters, or to no care at all, the while they tumble down cellar stairs, fall into tubs of scalding water, drink ant-poison, get run over by street cars, and cause divers other uncataloged and pleasant variations in the routine of Home, Sweet Home. There is surely every reason for the educated professional caretaker of little children that can be claimed for the kindergarten teacher. The profession should be as carefully prepared for, as well paid, and given as high social standing as that other.



And then I wish it were more often remembered that a mother is still the mother of her children when they are twenty and thirty and even forty-odd years old, and that they need something from her then as much as when under ten, but far more rarely get it. The professionally occupied mother, so far from growing apart from her children thereby, lives in the same world which her older children occupy, and so can give them at once sympathy and advice in the things most vital to them, which then surely are not their digestions nor their winter underwear.

Finally, I believe that the general entrance of women into the money-earning ranks would make marriage more frequent and more happy. The hesitation of young men to marry unless they can support their wives in what is considered "good style" would have little ground for existence if it were generally expected that the bride would unite with her husband in the maintenance of their home instead of doubling his expenses by requiring his support. And the not infrequent young woman who balks when solemnly informed that she "must choose between marriage and a career" would at least have to invent a new excuse for single blessedness. The chances of happy companionship and lasting affection would be far greater when the two had similar ambitions and activities than now, when the spheres of interest for husband and wife are so far apart that instead of our present shocked surprise at the prevalence of the "divorce evil," a much more reasonable attitude would be a *gratified* surprise that it does not prevail even more than it does. The unrestricted entrance of women into all the non-domestic careers is not a question of financial conditions, but of justice and the world's good. It is but justice for women to be free to make the most of the talents in which their endowment is as varied as that of their brothers; it would be good for the world to enjoy the new strain which would be introduced into its ideas and culture if educated women made as general *and definite* a use of their scholarly gifts as do educated men. Will only the millennium see an apprehension of this truth?

Our New Peonage: Discretionary Pensions

BY LOUIS D. BRANDEIS

[Mr. Brandeis is one of the best known lawyers in the country. He gives much of his time to public questions and has been especially interested in "industrial efficiency." Among his many activities we mention only that he was counsel for Mr. Glavis in the Ballinger-Pinchot investigation, and for the shippers in the advanced freight rate investigation, counsel for the people in proceedings involving the constitutionality of the Oregon and Selina ten-hour laws for women and chairman of the Board of Arbitration resulting after the great garment workers' strike in New York City.—EDITOR.]

HALF a century ago nearly every American boy could look forward to becoming independent as a farmer or mechanic, in business or in professional life, and nearly every American girl might expect to become the wife of such a man. Today most American boys have reason to believe that thruout life they will work in some capacity as employees of others, either in private or public business, and a large percentage of the women occupy like positions. This revolutionary change has resulted from the great growth of manufacturing and mining as compared with farming; from the formation of trusts and other large business concerns; from the development of our transportation and other public utility corporations; from the marked increase in governmental functions; and, finally, from the invasion of women into industry.

As soon as we awakened to the fact that America had become largely a nation of employees, the need of a comprehensive provision for superannuated wage earners secured attention. Given the status of employee for life and the need of an old age pension* is obvious. The employee needs the pension because he cannot—or at least does not—provide adequately from his wages for the period of superannuation. The employers need a comprehensive system because, while the presence of the superannuated employees in a business seriously impairs its efficiency, the dictates both of humanity and of policy prevent discharge unless his financial necessities are provided for. The demand for a pension system grows more pressing as businesses grow more stable, for in older businesses there is a constant tendency to accumulate superannuated employees. The demand becomes particularly acute when businesses grow large as well as old, for then it becomes difficult to provide for the individual needs of the abnormal employee.

As stated by the Massachusetts Commission on Old Age Pensions (January, 1910):

"The problem of dealing with the aged employee is an urgent one in the modern business world. The use of machinery and the stress of industrial employment have made it increasingly difficult for aged employees to hold the pace. The universal demand nowadays is for young men. Many concerns refuse to take on inexperienced men over thirty-five years of age. Moreover men wear out faster under the increased strain. What to do with the wornout workers—that is the essence of the pension problem. To carry them on the pay roll at their regular employment means waste and disorganization of the working force; to turn them adrift is not humane. In the past, large employers of labor have tried to meet this difficulty in piecemeal fashion, by retiring aged employees on pensions in certain cases, or giving them light work, each case being provided for separately, on its own merits; now they are beginning to deal with the problem in a sympathetic fashion by adopting a uniform method of retirement with pension.

"The motives that have induced large corporate employers to provide retirement pensions are partly economic and partly humanitarian or philanthropic. Economic motives play the leading part. This thing has been

*The term pension is used thruout this article in its popular sense as including old age annuities.

done because it has been found to be good business policy. The economic gain from the pension system is twofold: it eliminates the waste and demoralization attendant upon the continued employment of old men who have outlived their usefulness; and it helps to promote industry, contentment and loyalty on the part of the working force."

Economically, the superannuation provision may be considered as a depreciation charge. Every prudent manufacturer makes an annual charge for the depreciation of his machines, recognizing not merely physical depreciation, but lessened value thru obsolescence. He looks forward to the time when the machine, tho still in existence and in perfect repair, will be unprofitable, and hence must be abandoned. This annual charge for depreciation he treats as a necessary expense of the business.

From the point of view of the workingman the expense of providing old age pensions is a part of the daily cost of living. He should contribute while able to work to a fund which will sustain him when he ceases to earn. From the point of view of the employer, the expense of providing old age pensions is a part of the current expense of his business. He should pay as he goes the accruing cost of retiring employees who will become superannuated. If the wage is insufficient to enable the workingman to provide himself with a pension, it is not a living wage. So far as the cost of the old age pension is paid by the employer for the employees' benefit, it is in substance a part of the wage. So far as such a payment by the employer is for insurance against that waste and inefficiency in his establishment which would result from retaining superannuated employees, and for protection against that discontent which would result from discharging the superannuated without providing for them financially, it is a part of the business expense. Since the cost of making old age provision is thus either a part of the employees' daily cost of living or of the employer's daily business expense, it should be treated as a current expense, and may be likened to the premium for fire or accident insurance. Whether in the adjustment of relations between the employer and the employee this current cost of providing old age pensions should be borne wholly by the employer, or wholly by the employee, or jointly by both, is an open question; but European and American experience make it clear that under our present industrial system some comprehensive financial provision for the superannuated worker is essential to social if not to industrial solvency. To neglect such a requirement is as dangerous as it is for the manufacturer to ignore the depreciation of his machines.

For the protection of the wage earner it is obviously necessary that the right to a pension shall not depend upon his being in the employ of a particular concern. If his right to an annuity is dependent upon his remaining in a particular employ he loses all protection whenever he ceases to be so employed, whether he leaves voluntarily, or is discharged, or in case the concern discontinues business by failure or for other cause.

Adequate old age protection, therefore, cannot be secured to the wage earner thru the promise of a pension from a particular concern. He should have old age insurance which will protect the wage earner in whosesoever employ he may happen to be when he reaches the period of superannuation. For the protection of the wage earner it is likewise necessary that the pension system should confer an absolute right. No pension system can be satisfactory which makes the granting—or the continuance of a pension after it has been granted—a matter of discretion.

Germany, France, England and other European countries have undertaken to secure thru government action old age pensions for those who work in private businesses. The system adopted in each of these countries differs in some respects from that prevailing in each of the others, but each system embodies the essential requirements referred to above, namely: the pension is not dependent upon the workingman remaining in any particular employ, nor is it dependent upon the discretion of any individuals.

In America the providing of old age pensions for wage earners in private businesses is left wholly to private initiative. Many large concerns—railroads, public utilities, industrial and financial concerns—have established their own

pension systems. Under substantially all of these systems the wage earner receives no protection unless he remains in the company's employ until the age of retirement is reached, and even in that event the original grant and the continuance of the pension are, in large measure, discretionary.

Thus, the pension plan of the United States Steel Corporation, which took effect January 1, 1911, provides pensions only for those who have been in the employ of the company at least twenty years, and remain until the time for retirement; but no one has the *right to remain* in the employ:

Article 26: "Neither the creation of this fund nor any other action at any time taken by any corporation included under the provisions of the fund, or by the board of trustees, shall give to any employee the right to be retained in the service, and all employees remain subject to discharge to the same extent as if this pension fund had never been created."

Even if the worker has remained in the employ until the time fixed for retirement, and has served faithfully, he has no *right* to a pension:

Article 24: "The pension plan is a purely voluntary provision for the benefit of employees superannuated or totally incapacitated after long and faithful service and constitutes no contract and confers no legal rights upon any employee."

And a board of trustees, in whose selection the workers have no voice, and on which they have no representation, may refuse to grant them a pension or may terminate it after it has been granted for what they, in their discretion, deem adequate cause:

Article 22: "Pensions may be withheld or terminated in case of misconduct on the part of the beneficiaries or for other cause sufficient in the judgment of the board of trustees to warrant such action."

The pension plan of most other corporations embodies similar provisions. Thus, the pension plan of the International Harvester Company provides:

Article 14: "Neither the establishment of this system nor the granting of a pension nor any other action now or hereafter taken by the pension board or by the officers of the company shall be held or construed as creating a contract or giving to any officer, agent or employee the right to be retained in the service, or any right to any pension allowance, and the company expressly reserves, unaffected hereby, its right to discharge without liability, other than for salary or wages due and unpaid, any employee, whenever the interests of the company may, in its judgment, so require."

It has often been said by the corporations that one of their purposes in establishing a pension system is to "develop loyalty." But provisions like those quoted above suggest a purpose rather to *compel* than to *develop* "loyalty." The system is in effect a form of *strike insurance*. The pension is made dependent upon continuity of employment for a fixed period. The worker cannot receive a pension unless he remains in the company's employ until the date for retirement, and he has no right to remain in its employ, since the company reserves the full power to discharge him at any time, with or without cause. After a wage earner has served a number of years and feels himself growing older, the prospect of a pension becomes a potent influence. He realizes that if he abandons his position or is discharged, he loses not only immediate employment, but protection for old age He realizes also that the chance of securing other employment is greatly diminished by reason of his advancing years; diminished not because he is already old and less efficient, but because he will become superannuated sooner than a younger man, so that his employment by another concern will impose upon it or its pension system a superannuation burden sooner than if a younger man were selected.

Features in a pension system like those quoted above tend to make the wage earner compliant. He can be more readily relied upon to prove "loyal" and not to "go out" even if others strike for higher wages and better working conditions. The "continuous employment feature" of the pension system tends thus to rivet the wage earner to his employer, and the provision by which the allowance of a pension is made discretionary further insures "loyalty" of the wage earner during his employment. An employee of the United States Steel Corporation advancing in years might well be deterred from hazarding the prospect of a pension by trade union activity, or even by joining a union.

The tendency of such provisions in a pension system to destroy industrial lib-

erty is the more potent because the system is being adopted quite generally by those trusts and other powerful corporations which are determined to eliminate trade unionism. Indeed, in many cases the pension system was introduced as an aid to carrying out that labor policy. Individual employees, working under conditions which preclude collective bargaining, obviously lack industrial liberty so long as they are so employed, for they have no part in determining the conditions under which they work. After entering such employment, the only remnant of liberty remaining to them is the liberty of leaving it, and the features of the pension system just referred to undermine that remnant of liberty.

A pension system with such features must either prove a delusive protection or operate as a bribe to induce the wage earner to submit to a new form of subjection to the corporation. A frank employer recently said: "By providing so liberal a pension we have bought from the employee the right to leave us." Such a use of the pension is obviously illegitimate. The legitimate need of the employer for a pension system is satisfied if the provisions protect him from the necessity of keeping superannuated employees on the pay roll. This need of the employer is equally satisfied whether the employee retires on a pension or leaves the employ before the age of retirement. In other words, what the employer should seek to accomplish by the pension is merely to protect his business from the incubus of superannuated employees, and this purpose is accomplished as to each employee if he leaves the employ before he becomes superannuated. If the workingman so leaves, he should in some form carry with him the accrued right to a pension—the proportionate value of the time service—which would ripen into a pension if the workingman or his new employer paid the premiums of later years. Under these private pension systems that part of the pension earned by years of service is wholly lost when he leaves the company's employ, whatever the cause.

Employers seek to justify provisions in the pension systems like those quoted above by the fact that the pension fund is contributed wholly by the employer. But this fact furnishes no justification. The employer should not be permitted, even at his own expense, to establish a pension system which tends to rob the workingmen of his little remaining industrial liberty. A practice bearing such fruits is clearly against public policy. Many of our States have, in aid of industrial liberty, prohibited the employers from making it a condition of employment that their employees should agree not to join a labor union. It may become necessary to apply a similar prohibition against features in private pension schemes which have a tendency to unduly abridge the liberty of the individual workingman.

The Massachusetts savings insurance banks, and several of the life insurance companies, afford employers facilities for establishing pension systems which are free from the objections discussed above. From such insurance concerns there can be purchased for each employee an old age annuity which (subject to due premium payments) confers upon the holder an absolute right to the annuity, and which is equally effective in whosesoever employ the annuitant is, or if he be without an employer.

The premiums on such an annuity policy could be made payable at frequent intervals, say monthly, so that if payable by the employee they would not be too large to be borne, and if payable by the employer they may be figured as a part of the current wage or expense. The policy should preferably be taken out while the wage earner is young, so that the current premium may be small; for the annual cost of old age insurance, like that of life insurance, becomes almost prohibitive when the policy is not taken out until the insured is advanced in years. If the policy is not taken out until the wage earner grows old the premium will be so large that, if payable by the wage earner, it could not be borne, and if payable by the employer, might discourage the annuitants being employed. Under the Massachusetts system a separate annuity policy is issued for each employee, so that the employee can take the policy with him when he leaves a concern. The employee can then pay the premiums himself until another employer is found who is willing

to assume the charge as a part of his own system of providing against superannuation. The workingman possessing such an annuity policy taken out when young should meet with no difficulty in securing employment solely on account of advancing years, for the burden on the new employer of providing against his superannuation would be no greater than in the case of a younger employee.

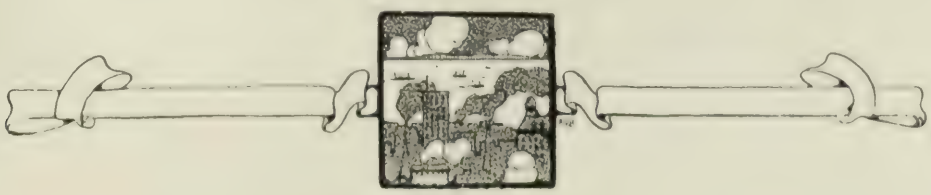
Every pension system should be contributory and co-operative; that is, the cost should be borne partly by the employer and partly by the employee, and preferably in equal shares. The management of the pension system should likewise be shared in by both employer and employee. The system should also be obligatory; that is, when a system has been established, all employees should, so far as possible, become subject to its provisions; and both employer and employee should be bound to continue the system once established. For the present, however, it should be optional with the employer and his employees to establish a pension system.

The Boston & Maine Pension Act,* passed by the Massachusetts Legislature in 1909, contains suggestions for such an elective, obligatory, co-operative system. That act provides, among other things:

First—A pension system is established only in case the company by a majority vote of its directors and a two-third vote of the employees voting thereon decide so to do. When adopted by such votes the system becomes operative with the force of law upon all persons then or thereafter employed, except such as voted against establishing the system, and also within three months thereafter filed their written objection thereto.

Second—The pension fund is supplied by monthly contributions from employer and employees in equal shares, the employees' share being deducted from wages and transmitted by the company to the pension fund.

Third—The management of the pension system is vested in a board of seven trustees, three of whom are selected by the company, three by the employees (who are formed into a pension association), and the seventh by the six so chosen.



Fourth—The amount of contributions to the pension fund is fixed as a percentage of wages. What percentage shall be assessed is determined by the trustees (subject to the approval of the directors of the company) up to an amount equal to 3 per cent. of the wages, and can be fixed at a higher amount if approved by the directors and the pension association.

Fifth—Any one who remains in the employ of the company up to the time of retirement has an absolute right to a pension. Any person who ceases to be an employee prior to the time fixed for retirement retains the right to a part only of the accrued pension; that is, a person who leaves the employ voluntarily, or who is discharged, receives not the full accrued value of the pension at the time of so leaving, but only an amount equal to his own contributions. The act embodies in this respect a very objectionable feature, which was reluctantly assented to by the committee of the employees, as necessary to secure the consent of the company to the support of the bill, and in the hope that a more just provision might be later substituted.

It is upon these general lines, consistent with individual liberty and industrial democracy, that the American pension systems should be developed.

BOSTON, MASS.

*The Act, which embodies the results of long negotiations between the company and the employees, was enacted May 29, 1909. On June 18, 1909, the Legislature of Massachusetts authorized the New York, New Haven & Hartford Railroad Company to acquire control of the Boston & Maine system. The New Haven management being opposed to the establishment of the pension plan, the Boston & Maine pension system has not yet become operative.

The Old Hard Problem

BY JOHN BURROUGHS

I HAVE been much interested lately in following the workings of several profound but quite unlike minds, touching the immortality of the soul and the phenomenon of consciousness, and noting the different methods by which they arrive at similar and dissimilar results. Henri Bergson, in his wonderful book, "Creative Evolution," touches upon the subject of the relation of consciousness to organization in a way that is suggestive and interesting, if not convincing. Bergson is a poet, a philosopher and a man of science in one, and the method of the poet, the simple assertion, often prevails, where the logical mind will demand something more like the scientific method. The steps by which he arrives at the conviction that "consciousness is distinct from the organization it animates" are not easily traced; distinct, he says, "altho it must undergo its vicissitudes." "As the possible actions which a state of consciousness indicate are at every instant being carried out in the nerve centers, the brain underlies at every instant the motor indications of the state of consciousness; but the interdependence of consciousness and brain are limited to this: *the destiny of consciousness is not bound up on that account with the destiny of cerebral matter.*" (The italics are mine.) What reason he has to think that consciousness is not bound up with the destiny of cerebral matter is just the point upon which so many of us want more light. He adds that "consciousness is essentially free; it is freedom itself; but it cannot pass thru matter without settling on it, without adapting itself to it; this adaptation is what we call intellectuality." But all this is not obvious; that consciousness does or may exist outside of matter is a statement of which all the world is seeking the proof. Bergson seems to identify it with the evolutionary impulse which pervades matter and of which his book is the exposition. He says:

"At a certain moment in certain points of space a visible current has taken rise; this current of life traversing the bodies it has organized one after another, passing from generation to generation, has become divided among species and distributed among individuals without losing any of its force, rather intensifying in proportion to its advance. . . . Life is essentially a current sent thru matter, drawing from it what it can. Life and consciousness are treated as if forming a kind of mystic partnership.

"Everywhere but in man consciousness has had to come to a stand; in man alone it has kept on its way."

He elsewhere speaks of the rising wave of consciousness, rising toward man. We are right, he thinks, in attributing to man a privileged place in nature and in believing in the "absolute reality of the person and in his independence toward matter." This in the same breath in which he says that science shows "the interdependence of conscious life and cerebral activity." Yet "a strong instinct assures the probability of personal survival," and the true light in which to regard the life of the body is that it is on the "road that leads to the life of the spirit." Souls, he says, are continually being created which nevertheless in a certain sense pre-existed.

The difficulty of reconciling two contradictory statements, like that of the identity of soul and body, while yet they are two and separable, Bergson evidently feels. Whitman said in his convincing way that "the soul and the body are one," while his belief in immortality was as unshakable as the mountains.

Bergson everywhere treats his theme after the manner of the poet and seer rather than in the manner of the man of science. The scientific philosopher will discredit him, will demand proof of his tremendous assumptions, but there is something in one that welcomes this breaking away from the rigid methods of exact science. Bergson is an inspired philosopher, he has in an eminent degree that gift of "vision" without which "the people perish."

His book is an attempt to interpret the phenomena of evolution in terms of life and mind which he must regard as its antecedents, rather than in terms of matter and motion, as does Spencer. In fact, he pretty effectually frees his reader's mind of the mechanistic theory of development of Spencer and his school, and substitutes a conception of the evolutionary process as an "unceasing transformation" in which a psychological principle is involved. "The physical order is automatic; the vital order is, I will not say voluntary, but analogous to the order 'willed.'"

"Analysis will undoubtedly resolve the process of organic creation into an ever-growing number of physico-chemical phenomena, and chemistry and physics will have to do, of course, with nothing but these. But it does not follow that chemistry and physics will ever give us the key to life." "In reality life is no more made of physico-chemical elements than a curve is composed of straight lines."

At the close of his eloquent third chapter he fairly lets himself go:

"As the smallest grain of dust is bound up with our entire solar system, drawn along with it in that undivided movement of descent which is materiality itself, so all organized beings, from the humblest to the highest, from the first organisms of life to the time in which we are, and in all places as in all times, do but evince a single impulsion, the inverse of the movement of matter, and in itself indivisible. All the living hold together, and all yield to the same tremendous push. The animal takes its stand on the plant, man bestrides animality, and the whole of humanity, in space and in time, is one immense army galloping beside and before and behind each of us, in an overwhelming charge, able to beat down every resistance and clear the most formidable obstacles, perhaps even death."

John Fiske, who was also an evolutionary philosopher and a felicitous writer, but much more closely bound by the scientific method, reached a similar belief to that of Bergson, but on quite other grounds. There is no such imaginative lift in his pages as in those of the French philosopher, but there is a logical process that is much easier to follow. If one may say that Bergson stimulates the soul without satisfying the reason, he may say that Fiske moves the reason without satisfying the soul.

In his lecture on "Life Everlasting," Fiske discusses the relation of the mind to the brain, and seeks to interpret that relation in terms of physical science. Failing to do this, and understanding why he fails, that is, because he has reached a region where the law of the correlation and the conservation of energy does not apply, he takes the ultra-scientific step of regarding the mind as an entity by itself and related to the brain only as the harper is related to his harp, and therefore not involved in the fate of its material instrument. Fiske's process of reasoning is this: Only matter can move matter, there can be no relation of equivalents between mental force and physical force; the law of the correlation of forces falls down here, and it is by this law that science swears. What goes into the body as physical energy must come out as physical energy or its equivalent. Molecular activities in the brain substance can only set up molecular activities in other substances—in the arm, in the leg, in the heart, in the lungs, stomach, kidneys, and the force expended in the one must be the equivalent of the force that is active in the other. Our thoughts, our emotions, our states of consciousness are entirely outside the circuit of physical causation as science conceives it, and hence are not causally related to the brain substance.

Fiske finds the circle of the activities of the brain substance, which result in muscular movements, a closed circle, and there is no point where it can connect with consciousness. He concludes, therefore, that consciousness, or the soul, is entirely outside of this circle of physical or physiological forces, concomitant with them but not correlated to them, and does not stand related to them, either as cause or effect. On this view he bases his argument for immortality, or the independent existence of the soul, and urges that its fate is not involved in that of the body. When we weep from grief, he says, it is not the grief that causes the tears to flow, because there can be no relation of equivalents between a sorrowful feeling and the motion of matter. "It is not the grief but the cerebrum that acts upon the tear glands." But what it is that acts upon the cerebrum, and sets its molecules in motion, Fiske does not say or try to say.

In what a dilemma the scientific method finds itself in trying to deal with such a problem—the dilemma of a man trying to lift himself by his own waistband. The mind of man seems to be at least one point in the universe where cause and effect meet and become one and inseparable. That the brain and consciousness are interdependent and interacting no one questions. It is the mystery of their union, their oneness and their separateness, that is baffling to science. That one is before the other, or that a change in one is before a change in the other, and is the cause of the change, is a hard proposition to prove. If you say the movement of the brain molecules is before the thought of feeling, then we want to know what started the movement of these molecules. And if you say the thought or emotion was prior to the molecular movement in the brain substance, then we want to know how there can be thought or emotion without this very movement. If the two movements are simultaneous, we cannot say that one is the cause of the other. To say they are only concomitants leaves the problem as dark as before. The law of cause and effect evaporates in our hands.

Tho we cannot figure out how there can be any sort of relation of equivalents between thoughts and things, or between mental force and physical force, yet we know that such is the fact. The force stored up in the body thru the food we assimilate may be expended in a mental effort just as unequivocally as in a bodily effort. If this is materialism, then I see no escape from materialism. It is the common sense view. One end of the law of the correlation and conservation of force disappears in the non-material, where force cannot be measured in foot-pounds. Force of a new kind, with which physical science cannot deal, appears but a force which in some way must be causally related to physical force.

Spencer states this fact succinctly, as follows: "The genesis of the mental energies is immediately dependent on chemical changes in the body. No idea or feeling arises save as the result of some physical force. But how a force existing as motion, heat or light can become a mode of consciousness is a mystery which it is impossible to fathom." But Spencer does not therefore affirm the independent existence of consciousness.

Fiske proves to his own satisfaction that matter cannot connect with mind—that the physical cannot be correlated with the spiritual. Why, then, should he assume that the reverse of the proposition is true? that mind can connect with matter and move it and use it, as it must do if the brain is only the instrument of the mind? Is it any easier to form a mental image of how the motions of the soul can be translated into motions of the brain substance than it is to form a mental image of the reverse process?

Physical science, speaking thru Huxley, Tyndall, Clifford, Verworn and others, takes the same view of the relation of the brain activities to our states of consciousness that Fiske takes, but none of them take the ultra-scientific step that Fiske does, and see in it proof of the independent existence of the soul.

"If anybody says the will influences matter," declares Professor Clifford, "the statement is not untrue, but it is nonsense." "Have we any reason to believe," asks Huxley, "that a feeling or state of consciousness is capable of directly effecting the motion of even the smallest conceivable molecule of matter? Is such a thing even conceivable?" But is it any more conceivable that one could lift his arm if his will did not in some way connect with the physical forces stored in the body? If the will or the immaterial substance called the mind does not set the physical machinery going that results in the lifting of the arm, what does?

Huxley, like Fiske and Bergson, sees that there are two worlds to be considered, the one physical and the other psychical, and that tho there is a most intimate relation and intercommunication between the two, the bridge from the one to the other has yet to be found, that their phenomena run, not in one series, but along parallel lines. But Huxley hesitates or refuses to take the step that the two other philosophers take. Science has to clap wings to its shoulders to make this leap, and Huxley apparently contented himself with contemplating

the gulf without trying to invent any way of clearing it. Tyndall is in the same boat with Huxley. He says:

"We may affirm that the brain of man . . . is also an assemblage of molecules acting and reacting according to law. Here, however, the methods pursued in mechanical science come to an end; and if asked to deduce from the physical interaction of the brain molecules the least of the phenomenon of sensation or thought, I acknowledge my helplessness."

Again he says:

"Take your dead hydrogen atoms, your dead oxygen atoms, your dead carbon atoms, your dead nitrogen atoms, your dead phosphorus atoms, and all the other atoms, dead as grains of shot, of which the brain is formed. Imagine them separate and sensationless; observe them running together and forming all imaginable combinations. This, as a purely mechanical process is *seeable* by the mind. But can you see or dream, or in any way imagine how out of that mechanical act, and from these individually dead atoms, sensation, thought, and emotion are to arise? Are you likely to extract Homer out of the rattling of dice, or the Differential Calculus out of the clash of billiard balls?"

Leibnitz felt this same difficulty and invented his "monads" to take the place of atoms and out of these he fancied all life to arise.

Professor Ladd, in his work on psychology, is mainly in accord with the conclusions of Bergson and Fiske. His examination of the subject leads him to "favor the theory which regards the mind as by no means wholly conditioned upon the brain for the character, order and laws of its development," and that the mind is "a real and non-material unit-being, unfolding its powers according to its own nature." Again he says:

"This being called mind is causally related to the beings called atoms; the relation is mutual. The mind behaves as it does because of the constitution and behavior of the molecules of the brain. The molecules of the brain behave as they do behave because of the nature and activities of the mind. Each acts in view of the other. The action of each accounts for the action of the other. But the action of neither is to be explained as solely due to the action of the other.

"The changes of the brain are a *cause* of the states of consciousness, and the mind behaves as it does behave *because* of the behavior of the molecules of the brain.

"But the sole cause of the mind's activities can, in no instance, be found in the molecular condition and changes of the brain."

Ladd is compelled to assume "the existence of a spiritual subject with a nature and laws of action very different from those ascribed to its physical basis, the brain."

The professor does not make good all these assertions. He takes the same leap that Fiske and Bergson do. That there is more of the mind than is involved in the cerebral activities, is a statement that is injected into the argument from without, and has no vital connection with it.

But what can science or the logical reason do with such a subject as the immateriality and immortality of the soul? Nothing, any more than the body can breathe in a vacuum, or walk in empty space. A scientific proof of immortality like that of Fiske's is just as unconvincing as is Verworn's or Haeckel's scientific disproof of it is unconvincing. For myself, I had rather stake my chances of immortality upon the intuitions of Goethe, Tennyson, Emerson, Whitman, than upon the reasoned conclusions of Fiske or Professor Ladd; upon the reality of the creature and super-mechanical law of evolution as Bergson sees it, than upon the irrefragable law of the correlation of physical forces as Spencer sees it.

On such a subject as I am considering I believe the poet, the prophet, the seer will come nearer the truth than the man of science in all the pride of his exact demonstrations; that men of vision such as I have named, men who see beyond the veil of the physical, are truer guides than the masters of the scientific method, like Haeckel, and Clifford, and Verworn.

The scientific method is supreme in the world of objective facts, but is it or can it be supreme in the world of subjective experience?

To convince the practical reason that the belief in immortality is a delusion is an easy matter, but to shake such a faith as Whitman's, for instance, was beyond the power of the logic of materials. Whitman was wont to say that a man could no more be talked into a belief in immortality than he could be talked into good health.

WEST PARK, NEW YORK.

The Modern Newspaper

BY CHARLES M. SHELDON, D.D.

Author of "In His Steps," Etc.

EVERYTHING in this world, including newspapers and churches, editors and ministers, is imperfect, and in the nature of the case open to improvement. We all recognize this fact, and this discussion of the modern newspaper is not in the nature of an attack, but rather a goodnatured discussion of one of the great factors in our civilization with an honest purpose in the heart of it all to contribute something to this factor which will make it more perfect than it now is.

I. *The Strong Points of the Modern Newspaper.*

1. The modern newspaper is a splendid everyday source of world knowledge.

With remarkable energy and enterprise the managers of the modern press reach around the world with long arms and strong hands to secure knowledge of world events. These are brought to our doors at a minimum expense. World history, the advancement of science, the movements of government, adventure, sport, commerce, human energy in various and interesting forms become a part of the individual reader's education. The modern paper serves a vast number of individuals working for the enrichment and interest of their lives.

2. The modern newspaper is the advocate of the people.

In very many important cases it starts reform movements for the good of the entire community. In very many cases the newspaper originates plans for human betterment, sometimes on an exceedingly large and unselfish scale. If it had not been for the assistance of the newspapers in Kansas, it is doubtful if the present prohibitory law would now be in force. In general the press of the State, in overwhelming majority, joined hands with the Church and good citizens to advocate what was in many ways a very unpopular movement, which cost many papers heavily in a financial way. The same use of the modern newspaper is found in many instances in different periods of history.

3. The modern newspaper is of great educational value, with special features of an educational character.

The editorial discussions carried on from day to day are in many papers of great assistance in shaping public opinion. Articles are published in the daily press gathered from the ends of the earth from the best literature, from the best minds, both past and present. One could gather from a file of daily papers in this country whole volumes of literary value. These are continually coming into the homes of the people and enriching and enlarging the lives of the readers.

4. The modern newspaper is a medium of intelligent publicity between states and nations.

A newspaper is a democratic thing. It is for all the people. One of the essential things in a government is that the states in a republic like ours should be acquainted with the history of one another. The newspapers furnish this history. What once took days and weeks and sometimes years to accomplish is now brought to public notice in short order thru the press, and even a country as large as our own, with its varied interests and different local concerns, is in a remarkable degree unified and knit together thru the printed pages of different newspapers of the different States, each one taking account of the doings of the entire people. In the same way the knowledge of other countries and their affairs thousands of miles distant helps to unite the interests of the world. The modern newspaper occupies a large place in the shaping of democracy.

II. *The Weakness of the Modern Newspaper.*

1. Much of the advertising, especially in the larger newspapers, is unworthy of a civilized press.

Many of our larger newspapers still think it necessary to print liquor adver-

tisements. Very many more carry what might almost be termed even more vicious advertising than the advertisement of liquor in the tremendous display of nostrums for the cure of every ill known to mankind. The patent medicine business is sustained and retained by hosts of newspapers which continue to print every day the most stupendous claims. If all the money the people of this country spend for patent medicines, which they spend because they see the advertisements in the papers, were thrown into the sea, we would have ten times the physical health and vigor we have now, and, if it were all spent for legitimate and scientific methods of keeping well, it would increase the healthfulness of the race twenty fold.

There is another kind of advertising which demonstrates the weakness of certain kinds of newspapers—a vicious and misleading and in many cases almost criminal advertising of fortune tellers, clairvoyants, personal notices of parties who claim they want to meet individuals for matrimonial purposes, etc. Advertisements, for example, of this character flood the columns of many of the great metropolitan dailies: "Gentleman, a stranger in the city, would like to meet a young working girl." "Your fortune can be told from the cradle to the grave. Send three 2-cent stamps and your birth date; I will surprise you." Again, "Love, health and wealth foretold." "Poor, proud, goodlooking, honest young man, tired of poverty's struggle, would like to correspond with a young woman." These advertisements appear by thousands in newspapers which have apparently a good reputation otherwise. Some of these advertisements can hardly be read aloud in a mixed audience, they border so near the indecent. Other advertisements carried by newspapers are, on the face of them, inducements to crime. The astonishing thing about this weakness of many of our papers is that no one seems to care very much. Yet, according to a recent writer, the answers to these advertisements are thousands in number, and people of every description are swindled and cheated and in many cases lured into lives of shame on accoun of advertisements which the editors and proprietors of these papers have no moral right to accept. There is great need of reform along this line. The temptation to the newspaper proprietor to take advertising matter must be at times something almost overwhelming; but after wading thru a large number of Eastern papers, which contain, more than any other, this kind of advertising, I was reminded of the old story of the subscriber to an old magazine in New England, who wrote to the editor giving a description of himself, in which he said: "I have been an invalid for forty years. I have been a subscriber to your paper during all that time and a constant reader. I have been a great sufferer, but grace has sustained me." It would take more than grace to sustain some people if they subscribed to some of these papers and read them, especially if the reading included the advertising columns.

2. Another weak point in the modern newspaper is its unwarranted invasion of private affairs.

If I should learn one day that one of my neighbors was having a quarrel with his wife and that the quarrel had reached the point where they had decided to separate, I might go over to his house, knock at the door and go in to make a call. Suppose I should say: "My wife and I have just heard that you are having trouble here in your family circle. We are very much interested in your affairs and we would like to know the details. When did this quarrel begin? When do you expect to be separated? What disposition will be made of the property? Do either of you anticipate being married again after divorce, and, if so, to whom? My wife and I would like to have the photographs of all the parties interested, with a full account of your family troubles from the time they began, together with the sequel so far as you can now furnish it."

If I should do a thing like that with my neighbor it seems to me it would give him a reasonable excuse to entertain at least the idea that he might possibly kick me out of the house; but a good many modern newspapers do not hesitate literally to invade a family under just such circumstances, get all the details and all the rumors and print a page or two, especially if the people are well known socially. In other words, what is not permitted an individual and what would be

considered a most insulting and impossible thing on the part of an individual, the modern press does not hesitate to do.

Representatives of Eastern newspapers have, without any hesitation, practically forced their way into the study of my church and practically demanded an interview or subject matter for publication in their papers, covering a work some of which was, to my mind, of a private and personal character, with which the public had no business; and when these representatives were told respectfully that it was none of their business and the public had no possible right to the matter in question, they have replied that they had been sent to get a "story" and would get one anyway. So it made no difference to them except some possible inconvenience and delay, whether I would submit to their demands or not.

If one person should hold up another at the point of a gun and demand his money, it would, in most civilized countries, be regarded as at least open to criticism. But certain types of newspapers in this country, especially in the great centers of population in the East, do not consider it to be anything out of the way to take what does not belong to them in the matter of what they consider news—the definition of "news" being anything which these papers think their readers will be eager to read. The most secret personal matters, the most delicate feelings on the part of individuals, are not respected. They are all of no account by the side of the "story" which the newspaper is bound to have. This is an invasion of private rights and has reached the point where no experience, even that covered by the sacred time of courtship and marriage, and the inner sanctuary of the home and church, is any longer respected by those whose only desire is to bring before their constituents what they regard as their own property. There must be some rights which the individual possesses, but it is difficult often to know how they can be defended. It does no good to reply to anything. Perhaps silence is as dangerous as speech. If one refuses to give certain matters, the reporter in the employ of the proprietor will get something somehow. If one speaks, he yields to a holdup. If he does not speak, something is manufactured. He is between the devil and the deep sea.

It is, no doubt, very often a fine point with the conscientious journalist to know when a private matter becomes public. Not all the great interest on the part of the reading public in the affairs of other people can be traced to gossip or to an insolent meddling in other people's affairs. Some of the human interest we take in other people is altogether legitimate. There is nothing so interesting as the affairs of human beings. But there must certainly be some clearly defined region within which the press has no possible right to step without being guilty of an impertinent intrusion. There must be some chapter in the human lives about us which is sacred to the life itself and is not meant for the general public's gaze or perusal. That the modern newspaper oversteps these bounds and is guilty of unwarranted handling of other people's private affairs is, I believe, a fact which cannot be denied.

3. Another weak point of the modern newspaper is its habit of inaccuracy.

Examples of this can be found in nearly every issue of nearly every modern newspaper in the country. A public speaker a few weeks ago at a religious gathering asked the question, "Has Christian Endeavor seen its day?" That question went all over the country, was copied in hundreds of papers, with the comment attached to it that it *had* seen its day, and on the very day that this address was made the statistics reported for the months of October and November following, that 570 new societies had been formed in those two months. Another speaker about the same time, at a great religious gathering, said that the Christian Endeavor Society was a "spent force." That statement was also sent all over the country. Thousands of readers who read the statement honestly think that this great organization of young people is a "spent force." As a matter of fact, after thirty years' existence, the year 1911 shows 4,000 new societies in the Endeavor ranks, with a total enrollment of more than 74,000 societies, with a membership of more than 3,750,000 of young people in every country in the world.

If I may be pardoned for using one or two personal illustrations to illustrate this weakness of inaccuracy in the modern newspaper. In an address made by

me a short time ago, speaking of conditions in Topeka, I said: "Sometimes, perhaps, as much as forty barrels of liquor is brought into Topeka in twenty-four hours; that is, liquor put up in bottles and then put in barrels, and mostly beer."

I emphasized three different times the fact that this liquor was put into bottles before it was put into barrels, and that if it were poured out of the bottles into the barrels it would not make more than one-third of forty barrels of liquor, mostly beer. But the statement went out thru the press, copied not only by the papers in Kansas but in other States, that I had said forty barrels of *whisky* came into Topeka *every day*. I suppose this statement was believed by thousands of people who read it. The astonishing thing to me about it, however, is that not one editor among all the editors that published the statement and wrote caustic editorials about it, ever wrote to me asking whether I had said anything of the kind or not. Another statement has gone out, under the heading of "It is said," that I had been offered $25,000 to put "In His Steps" in dramatized form on the stage. I have never been offered any such sum by anybody. I never said I was offered any such sum. No one ever asked me whether I ever had such a sum offered. I cite these two personal instances because I know the facts in the case. I think it is safe to say that public speakers all over the country are continually misrepresented and misquoted by the modern newspaper in the same way. It has always been a matter of great satisfaction to my mind that there were no daily papers in the time of Christ. I honestly believe that if there had been we should today have no accurate history of his life. If there is anything which the modern newspaper needs to protect itself from, it is this daily habit of inaccurate reporting. I would rather have an every other day paper which took time to corroborate its statements, so that I could be sure that what I read was at least approximately true, than a daily paper which evidently does not have time in the great rush of its life to look up and substantiate what it prints. The great and never ceasing slogan of the daily paper should be "the truth, the truth, the truth." As a matter of fact, there is not enough going on in the whole world, even of what the papers call news, to fill them in the proper way. On that account insignificant items on what are called dull days are tremendously padded. Any one who watches the columns of the daily paper understands that on certain days comparatively trivial things receive large attention because nothing else has happened among humans that seems of interest, and in padding articles there are almost infinite possibilities for numberless inaccuracies.

4. Another weakness of the modern newspaper is its publication of matters out of proportion.

I mean by this the real things which make up real human history which are of actual importance are dwarfed and minimized, and superficial things and things of no great importance are given the right of way. In looking over a vast number of newspapers lately, I find, especially in the Eastern big city dailies, and especially in the Sunday editions, which range all the way from twenty-four to seventy-four pages, the printed matter may be arranged something like this in the matter of importance, so far as the number of pages printed is concerned: (1) Fashion and athletics. (2) Theaters and society. (3) Politics. (4) General collection of printed matter which would come under the head of personalities, *i. e.*, "writeups" of distinguished or notable men and women, making special features in particular of interviews with women who figure in social life or in theatrical circles. (5) Literary articles, including stories, fiction, etc. (6) Education and religion. I give the items in the ratio of their importance as measured by the amount of matter given to each, fashion and society being overwhelmingly at the head of the list. This list does not include printed or so-called "comic" supplements, which to my mind, in brief, are simply unspeakable horrors, in which the sickening repetition of the same tricks played by children on grown people or by one person on the other have been hashed over so often that they are fit for nothing except a garbage pile and are almost too bad to go into the crematory.

The modern newspaper owes a debt to civilization which it ought to pay. For years the Church and the private individ-

ual have been held accountable for the regeneration of mankind. As a matter of fact, the regeneration of mankind is such a tremendous job that not even the Church or the Christian citizen can measure up to it alone. The great newspapers of the world, which, for example, keep silent on the question of the liquor business, are guilty of not doing their share. The Church in the world is not sufficient by itself to accomplish so great a reform as the destruction of the liquor business. How many newspapers, for example, in New York City, Philadelphia, Chicago, Boston, Denver, San Francisco, are doing anything to help the Church wipe out the saloon? But if these newspapers would give their assistance to this great work, united with the churches and Christian population to clean out of our civilization one of its worst enemies, there would not be a saloon left in the United States within ten years. It is my honest conviction that the press in the great cities is guilty of a wrong against civilization because it does not assist civilization as it might. If the leading dailies of the country banded together in one great brotherhood they could accomplish miracles of regeneration of humanity.

This same power exercised for the good of the race could make a wonderful campaign against poverty. It could fight established corporate greed, it could be the greatest voice ever heard since the voice of John Baptist, to proclaim liberty to the children of men. The time has come in our civilization when there must be a recognition of the fact that all the forces which we call civilization have a duty to unite for the welfare of the whole. Because a man is not a member of a church and does not call himself a Christian does not excuse him in the least from doing his part to make a better world. The editors and proprietors of newspapers are just as much bound by obligation to use their great influence in bettering every part of human life as the minister, the missionary, the evangelist, or the Sunday school teacher. The imagination cannot picture the wonderful establishment of righteousness in business or purity in politics or happiness in the home or the tremendous lessening of crime and disorder and poverty if all the newspapers of the country would enter upon a great crusade for mankind. I suppose it is well understood that the great dailies that keep still in matters of tremendous value to the welfare of men do so from personal motives, for fear of loss of patronage, or failure to support great movements. The same thing would be true of any church that refused to speak out or work for the interest of mankind. In the editorials gleaned from some of the larger papers published in this country, I find the following subjects treated: "Piers for big steamships"; "The bicycle craze"; "Litter in the streets"; "Let your costume symbolize your creed"; "Why can't departed spirits rest in peace?"; "Missouri is going about the restoring of racing in the right way"; "Senator Fry's rebuke"; "The foreign service"; "Support for Secretary Meyer"; "Are old habits to prevail?"; "Naming a planet after Carnegie"; "Whitelaw Reid on Bryan"; "Mr. Clark and the Presidency"; "Railroad control in Texas"; "The new political baby"; "Pension the life savers"; "District day blotted out"; "Public sentiment in senatorial elections"; "First blood for New Orleans"; "Object lesson from two railroads," and so on. These editorials do not represent the possible ethical fiber of the newspaper man of America. They do not get down to foundation facts of humanity. They do not discuss the things which are of vital interest. Let New York, Kansas City, St. Louis, Chicago, Denver and other whisky ridden towns begin a campaign against drink and the brewer and all his tribe, and take up other subjects which vitally affect the real interests of men, women and children in this nation, and newspapers would begin to define themselves as agents of God, and the printed page would begin to glow with the light that never was on land or sea.

The modern newspaper has an unlimited opportunity to advance the brotherhood of mankind. It is a democratic institution. Practically everybody reads it. It is the one printed page which goes into every home and is read by every man. It is in one way the most democratic institution we have. It has within its powers the unlimited power of daily speech. The average minister is fortunate if he has 500 people once a week to talk to. The average newspaper has its daily audience of thousands. There is opportunity for unlimited originality in

the way of illustrations of new and happy humor. There is no original humor in the modern newspaper as yet. It is all a thrashing out of old stuff with nothing new or humorous about it. Young men and women looking toward journalism in the making of the new newspaper have the most unlimited field for original research known to any profession. There is nothing in the minister's, doctor's, lawyer's or politician's life to compare with it. The modern newspaper could, and I believe it will, make a wonderful contribution to the final brotherhood of the race, and with the Church and home and school and state help bring in the millennium. I hope to be here when it comes.

TOPEKA, KAN.

The New City

BY MARGUERITE O. B. WILKINSON

HAVE ye seen her, the New City, O my brothers, where she stands,
The superb, supreme creation of unnumbered human hands,
The complete and sweet expression of unnumbered human souls
Bound by love to work together while their love their toil controls;

Built by brothers for their brothers, kept by sisters for their mates,
Garlanded by happy children playing free within the gates,
Brooded by such mighty mothers as are born to lift us up,
Till we drink in sweet communion of God's blessed loving cup?

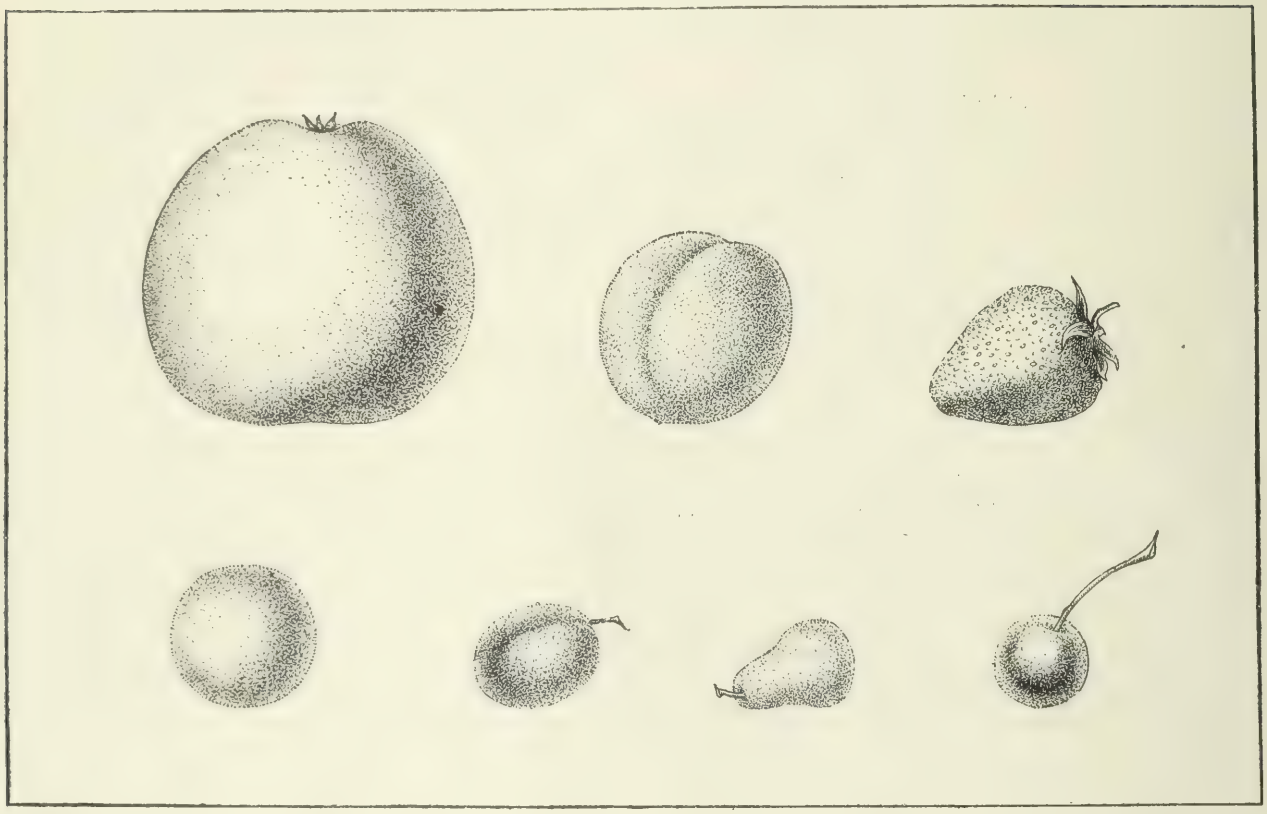
Clean and sightly are her pavements, ringing sound beneath men's feet,
Wide and ample are the forums where her citizens may meet,
Fair and precious are the gardens where her youths and maidens dance
In the free, fresh air of Heaven, midst the flowers' extravagance.

And her schools are as the ladders to the Spirit from the Clay,
Rising round by round in labor, strengthened side and side with play.
Yea, her teachers are her bravest, and her governors her best,
For she loves the little children she has nourished at her breast!

Never clangor of the trumpet, nor the hiss of bullets mad
Breaks the music of her fountains, plashing seaward, flashing glad,
And no excess and no squalor mark her fruitful, fair increase:
She has wrought life's final glory in a miracle of peace.

And her citizens live justly, without gluttony or need,
For he toils to serve the city who has bread enough to feed
All his own, and she must labor who would hold an honored place
With the women of the city in their dignity and grace.

Have ye seen her, O my brothers, the New City, where each hour
Is a poet's revelation, or a hero's deed of power,
Or an artist's new creation, or a laborer's new strength,
Where a world of aspiration clings God by the feet at length?



Have ye seen her, O my brothers, the New City? Ah, not yet
Gilds the sun in actual splendor chimney top and minaret;
But perchance her site is purchased—yea, her pattern is designed,
For her blessed ways are visions of all weary humankind!

SANTA BARBARA, CAL.

Native Fruits

BY WILLIAM B. BAILEY, Ph.D.

Assistant Professor of Political Economy at Yale University.

THE total value of all the fruits and nuts produced in continental United States during 1909 was about $220,000,000. The apple is easily the king of our fruits, with a value of over $83,000,000. During the past ten years, however, our apple crop had decreased from over 175,000,000 to less than 150,000,000 of barrels.

The fruits which in 1909 showed a production in excess of $5,000,000 were as follows:

Apples	$83.2	millions
Peaches	28.8	"
Grapes	22.0	"
Strawberries	17.9	"
Oranges	17.6	"
Plums and prunes	10.3	"
Pears	7.9	"
Cherries	7.2	"
Raspberries	5.1	"

Grapes were not represented at the top of the page, for in 1899 the corresponding figure included the raisins, grape juice and wine made on farms. Of the tropical fruits the production has about trebled during the past decade, while that of pineapples has increased about ten fold during the same period.

The production of orchard fruits has just about held its own since 1909, but the production of all of the fruits of this class with the exception of apples has increased. The peach crop in 1909 was more than twice that of 1899. A significant change to the housekeeper has been an increase of nearly 70 per cent. in the value of the orchard fruits since 1899, while the production increased less than 2 per cent.

The small fruits or berries showed a decrease since 1899 in the production of all varieties, with the exception of cranberries. Although the decrease amounted to nearly 40,000,000 quarts, the value of the crop increased nearly $5,000,000. The cost of living steadily advances.

Literature

A Trenchant Attack on Logic

THE reader does not have to go far in Dr. Schiller's *Formal Logic** to discover that the author's purpose is a systematic destructive criticism of what is known as formal logic, not an addition to the almost innumerable textbooks on the subject. "Nonsense fortified by technicality" is his more casual way of referring to it; his more formal statement is that it is "inconsistent, incompetent and meaningless." But we must hasten to add that the book is in no sense adequately characterized by such a selection of abusive epithets. Indirectly, if not directly, the aim of the book is constructive: "to clear the ground for a new logic that will not disdain to reflect upon real thinking, nor confine itself to fictions and falsifications." The book makes its appeal to a narrower, because more technically trained, circle of readers than Schiller's previous books upon humanism. While possessing their lucidity of style, his mode of treatment is more rigorous and more restrained. Probably some academic philosophers who have been offended by his unconventionality and occasional flippancy, and by his disregard of the professional technique for playing the philosophic game, will revise their opinion of Schiller on account of the sobriety, the severe consecutiveness and obvious scholarliness of the present volume.

In substance, the volume (a large octavo of about four hundred pages) is an unrelenting, dogged pursuit of the traditional logic, chapter by chapter, section by section. Not a single doctrine, nor, I think, a single distinction of the official textbooks escapes Schiller's demolishing hand. Those who have forgotten their college logic—which includes all, I imagine, whose fate it has not been to teach it subsequently—would not follow much of the book intelligently unless with a text in hand. Accordingly, I shall make no attempt to summarize its specific contents, as that would take the reader into the far off mysteries of extension and intension of terms, the nature of categories and predicables; the laws of thought and the opposition of propositions, thru the syllogism and its rules to the inductive canons and the various kinds of fallacies, formal, semi-logical and material. For purposes of technical students, the value of the book resides in the thoro and detailed way in which Schiller has followed up and criticised all the conceptions of formal logic, never letting up till he has subjected the last one to examination. But, as our author points out, there is a guiding principle of unity that holds together all these detailed criticisms, for there is a single source of the incurable defects of formal logic. And this principle of unity involves a point which concerns any intelligent reader, whatever his lack of interest in the technicalities of formal logic. The difficulties and inconsistencies, the final meaningless of formal conceptions, is that formal logic is engaged in the impossible attempt of considering modes of thought "in themselves," apart from their application to actual situations. It is the absurdity of this attempt which deprives formal logic not only of truth, but of meaning. This is the clue that Schiller follows so unrelentingly thru the logical labyrinth, and which gives an almost dramatic interest to the driest of the criticisms—dry, because the things criticised are so hopelessly mummified. In every case he shows the abstraction from the concrete conditions of human use of logic, and the fatally paralyzing effect of leaving human application out of account.

Incidentally, one of the most interesting things in the book is the glimpse that it gives, by way of contrast, of a genuine logic which shall report the conditions and aims of actual human thinking. Some of the conceptions which will be

*FORMAL LOGIC A SCIENTIFIC AND SOCIAL PROBLEM *By F. C. S. Schiller, M.A., D.Sc.* New York: The Macmillan Co. $3.25.

fundamental in it and which are totally omitted from formal logic are meaning, truth and error in their concrete difference from each other in a specific case, selection, relevance and risk. Meaning depends upon context, bearing and intention; and formal logic must exclude these from its ideal, for they are human and psychological. While traditional logic has much to say about truth, the truth it talks about is mere formal consistency, since it declines to consider the material application of its premises. Relevance—a fundamental conception of concrete thought—is excluded because it goes with selection, with selection of the *part* that is useful, while formal logic professes an all-inclusive ideal. Selection, moreover, is a voluntary and hence arbitrary act, and so is shut out from a doctrine that acknowledges only what is purely theoretical. Finally, formal logic, with its creed of absolute certitude, abhors the very mention of adventure and risk, the life blood of actual human thinking, which is aroused by doubts and questions, and proceeds by guesses, hypotheses and experiments, to a decision which is always somewhat arbitrary and subject to the risk of later revision.

A vital and wholesome sense of the realities of actual thinking pervades the whole book; it supplies the background against which the criticisms of formal doctrine are projected. The book should not only attract new readers to Schiller and increase his already enviable reputation, but it should lead some thinkers to reconsider their prejudices against the introduction of psychological—that is, human—factors into logical theory. Mr. Schiller brings out, in case after case, with a cumulative effect which is fairly deadly, that at the crucial point each formal distinction is saved from complete meaninglessness only by an unacknowledged and surreptitious appeal to some matter of context, need, aim and use. Why not, then, frankly recognize the indispensableness of such volitional and emotional factors, and instead of pretending to a logic that excludes them, build up a logic that corresponds to human intellectual endeavor and achievement. It is difficult to see how even the most hardened devotee of a purely theoretical intellectualism can lay down the book without such questions haunting him.

To many it will probably seem that Mr. Schiller exaggerates the importance of the foe which he attacks. He will seem to them to be making too much of what at most is hardly more than a temporary annoyance of some college students. In one respect, I think this feeling is justified. Mr. Schiller is evidently stirred by the educational situation in which he finds himself at Oxford, and to which he wittily refers as follows: "Both logic and science can academically prosper under the delightfully paradoxical regulations of e. g., Oxford, where what is supposed to be the *theory* of science is only taught to those who know nothing of its *practice,* while those who are experts in the practice of science are not allowed to study 'a theory of science' which could only delay their progress." At Oxford, one gathers from many of Schiller's statements and still more from his general tone, formal logic is so deeply entrenched as a subject for study in its traditional form that one runs risk in attacking it. Certainly, it occupies no such consecrated and protected position in American higher education, nor in the esteem of American educational authorities. There would be a general popular willingness to accept the characterization of it as "nonsense (or at least pedantry) fortified by technicalities" without taking the trouble to read the arguments upon which Mr. Schiller bases his description. From our educational point of view, then, there can be no doubt that Mr. Schiller takes the subject-matter of formal logic altogether too seriously. But when one leaves the technical subject-matter and comes to the general conception of the nature of thought and of the intellectual ideals and methods which should operate in life, the same cannot be said. It is impossible to exaggerate the extent of the influence of formal consistency and formal demonstration, and of the notion of an "intellect" working in detachment from need, motive and specific application to a concrete situation. As Mr. James said of a similar matter, the change invoked in passing over to a logical ideal based upon opposite conceptions of the nature of mind and its rela-

tion to life, marks a revolution hardly second in importance, with reference to the change indicated in the seat of intellectual authority, to the Protestant Reformation. From this point of view Mr. Schiller's volume, in spite of its technical subject-matter and mode of treatment, is a significant contribution to one of the most fundamental of our social issues. His sub-title, in its reference to a "social problem," is more than justified. JOHN DEWEY.

Blücher and the Uprising of Prussia Against Napoleon, 1806-1815. By Ernest F. Henderson. New York: G P. Putnam's Sons (Heroes of Nations Series). Pp. xx, 347. With 32 Illustrations and 6 Maps. $1.35.

Who won the battle of Waterloo? If you are an Englishman, Wellington did; if you are a German, Blücher. Each general ascribed the victory to himself; and strong as had been their mutual regard before the battle, a noticeable coolness sprang up between them afterward. Blücher was seventy-three when he fought at Ligny, but, as was shown in the hardships of the June days, he was still capable of great endurance. There were those who sneered at his military talents. According to Müffling: "All Europe knew that the old Prince, who was past seventy, understood nothing at all about leading an army"; and Hardenberg said that the supreme command had been given to him rather than to Gneisenau because "the King adheres to the system of advancement by age." Mr. Henderson, on the other hand, believes that those who lay stress upon Blücher's shortcomings lack the imagination which enables one to appreciate the superiority of genius over mere routine. The soldiers would do anything for their leader, and in sustaining the spirits of his beaten army on the wearing march from Wavre to Waterloo he accomplished, in the view of our author, what probably no other general in the Prussian army could have done. "I have promised my brother Wellington," he told the men. "You would not make me a perjurer!" Thus it was that Blücher kept his word and raised the question, bitterly debated for a century, as to who the real victor was. Mr. Henderson takes the German view. He also handles the Iron Duke somewhat roughly, asking why he wasted his time at the Duchess of Richmond's ball, how he came to send Blücher a false statement as to the disposition of his forces, and other pertinent questions. In spite of occasional defects of style and inexcusable mistakes in punctuation, the book makes delightful reading. It is, curiously enough, the only biography which has appeared in English. Blücher was once very popular in England. He wrote to his wife from London in 1814: "The English flock here by hundreds to see me; I have to shake hands with each and every one, and the ladies make regular love to me. They are the craziest people I know!" He left England, as he exprest it, "alive, but worn and weary." All that, of course, was before he saved Wellington at Waterloo!

Anglo-American Memories. Second Series. By George W. Smalley. New York: G P. Putnam's Sons. Pp. ix, 418. $2.50.

What may be described as the text on the title page of Mr. G. W. Smalley's *Anglo-American Memories* is from Machiavelli. "I have found among my possessions," it reads, "none that I so much prize and esteem as a knowledge of the actions of great men." Mr. Smalley has seemingly no use for any other variety of men; for in both series of his *Memories* he is concerned only with what he regards as the great, the good, the interesting and the illustrious. Thirty sketches of men and women—some of them Americans, more of them English—who interest Mr. Smalley because, according to his judgment, they are included in these categories, are comprised in this second volume; and to superior persons who like hearing about superior persons from a superior person, Mr. Smalley's sketches cannot fail to be interesting. Lloyd-George must have failed to ingratiate himself with Mr. Smalley. One might almost conclude that Mr. Smalley was a duke, or that at least during his residence in London he had been compelled to pay super-income tax under the provisions of the budget of 1909, for he derives satisfaction apparently from indulging in as many sneers as possible at Lloyd-George. It is scarcely conceivable that Gladstone

was ever disturbed by what any London correspondent of a New York newspaper wrote in opposition to his home rule bill of 1886. Mr. Smalley says that Gladstone never forgave him for his letters to the *Tribune* against home rule. It is as hard to believe that Gladstone worried about what appeared in the *Tribune* as it is to believe that the Czar was disturbed when the Skibbereen *Eagle* made its famous announcement that the *Eagle* had its eye on Russia.

The Beginnings of Quakerism. By William C. Braithwaite, B. A., LL. B. With Introduction by Rufus M. Jones, M. A., D. Litt. New York: The Macmillan Co. Pp. xliv, 562. $4.

The renewed interest in Quakerism, which is showing itself at the present time in a large literary output concerning the origin and history of the Society of Friends, is not a matter of chance. It is one of the signs of the great religious awakening now passing over the Anglo-Saxon world—the movement that differentiates the present era from the days of respectable orthodox Christianity and materialistic atheism of the seventies and eighties of the last century. The two outstanding characteristics of the Society of Friends are mysticism—first-hand religion rather than dogma—and right living as the test of faith rather than orthodoxy of creed. Both these characteristics of early Quakerism were largely submerged in formalism and triviality during the nineteenth century; but with the general awakening of the English-speaking race, men have again discovered that the Quaker pioneers had a message and a revelation; and the Society of Friends is resuming its place as a quickening force in the life of the nation. Mr. Braithwaite's book is one of a number of books, written by men in close sympathy with the movement, describing the rise and progress of Quakerism in England and America. Dr. Rufus Jones, who writes the introduction, published last year a history of the Quakers in New England, and three years ago his "Studies in Mystical Religion," which traces the religious thought of the Quaker type in primitive Christianity and in the medieval ages. In the present volume Mr. Braithwaite links up the teachings and faith of George Fox and his companions with the religious movement of the first half of the seventeenth century. He shows where the accepted forms of religion—Episcopalian, Presbyterian, Independent and Baptist—failed to satisfy many earnest seekers after God, and how ready was the soil for the acceptance of Quaker mysticism. He also shows how the individualism of the Quakers clashed with the views held of the proper subordination of the people to authority, civil and religious, and he traces the persecution of the Quakers as due to their sturdy refusal to submit their own judgment to that of their constituted superiors. The Quakers, both in England and in New England, formed one of the greatest difficulties of the Government. Testimony as to their uprightness and good living was never lacking. They accepted persecution with alacrity, but there was no compliance in their peaceableness, and in the end they won from the Government every point on which they consistently insisted, from wearing their hats in the presence of their sovereign to conducting their worship and their ceremonies of marriage and burial in accordance with their own consciences. Mr. Braithwaite's book carries the story only from 1643 to 1660, but for this period he covers the ground almost exhaustively, and incidentally throws much new light on the England of Cromwell and of the Restoration.

Social Life in the Insect World. By J. H. Fabre. Translated by Bernard Miall. New York: The Century Company. $3.

The multitude of people who have read Bergson will remember that he has much to say of the extraordinary instinct of insects, which goes beyond reason, as told by M. Fabre. He is the insect's biographer, its panegyrist. He has written hundreds of articles telling what he has seen insects do, and Maeterlinck calls him "The insect's Homer." We have in this delightful volume but a selection from his essays, covering the life of the sacred beetle and various crickets, moths and weevils. The wonder grows as one reads of the marvelous instinct of these insects, who have a knowledge which surely does not come by either reason or parental education, and which it seems

impossible to believe is the result of slow evolution by experience. The questions involved M. Fabre does not ask or answer; he only tells us the vital history; but Bergson tries to answer it by what is no answer at all, but a statement of what instinct is in its superiority to reason. All this opens a new field for the argument for design in theology. But this is the field for philosophy, while our author is satisfied with the biological side, and that is enough to satisfy the reader who will follow with delightful surprise the sociable companionship of the author as he wanders the moors or watches the conduct of his captured insects in the glass and wire cages he has made for the easy study of their life and love.

One Look Back. By the Right Hon. George W. E. Russell. New York: Doubleday Page & Co. Pp. 368. $2.50.

Mr. Russell usually keeps near the surface, a fact that will commend his book to many readers who do not care for the serious or the profound. He writes in a delightful style, with obvious sincerity; and as a grandson of the sixth Duke of Bedford, and a nephew of Lord John Russell, he has had opportunities, political and social, that only befall a scion of the privileged class. It was Mr. Russell's fortune to be born a Whig. This was the only way in which a man could become a Whig in the days when Whiggism was dominant. Most men would have been content with the enjoyment of that great advantage and would have done no thinking that might disturb their Whiggism. But Mr. Russell has traveled far beyond Whiggism in political principles. If he had not he would today of necessity have been of the Conservative party. He has developed into a Radical, and there are pages in *One Look Back* where Mr. Russell can be suspected of some sympathy with Socialism. Politically he was a lonely boy when he was at Harrow, for he describes the Harrow of his time as, like all the other great English public schools, as Tory as the sea is salt. Out of five hundred boys who were there then Mr. Russell can recall only five who showed the Liberal colors during the election of 1868. He was one of the five, and for showing his colors he was rolled in the mud. Mr. Russell's sketches of Oxford are distinctly interesting; so are his studies of aristocratic West End London at the end of the seventies. But he is most informing when he is retrospecting his life in the House of Commons and his association with Gladstone, of whose administrations of 1885-86 and 1892-95 he was a member.

The Influence of Wealth in Imperial Rome. By William Stearns Davis. New York: The Macmillan Co. Pp. xi, 340. $2.

Professor Davis has been widely known as the writer of several historical novels, and something of their influence is shown in the style of the present volume, a style which is never tedious and which is now and then highly diverting. Thus the opening chapter has to do with "the business panic of 33 A. D.":

> "As with most panics, the causes of this were not obvious. About a year before, the firm of Seuthes & Son, of Alexandria, lost three richly laden spice ships on the Red Sea in a hurricane. Their ventures in the Ethiopian caravan trade also were unprofitable, ostrich feathers and ivory having lately fallen in value. It soon began to be rumored that they might be obliged to suspend. A little later the well known purple house of Malchus & Co. (centered at Tyre, but with factories at Antioch and Ephesus) suddenly became bankrupt."

The result was a "run" on the great banking house which had made loans to these firms, and a crisis on the Via Sacra ("the first century Wall Street") which had disastrous effects in Lyons, Byzantium, Corinth and other distant parts of the empire. To an erudite German scholar such language might savor of levity; it will, however, serve to enlist the interest of ordinary men in a subject which usually attracts only the specialists. The book was written with the idea that both the greatness and the ultimate failure of the Romans was largely due to the supreme regard which they gave to wealth and all that wealth could bring. Professor Davis does not draw a flattering picture of Roman character. Even the Jew had more sentiment in business. If the average Roman realized that honesty was the best policy, he gave that virtue a narrow and formal definition. "The love of gain and of the enjoyments which followed gain too often blunted his vision utterly; and made him a harsh father, an unfilial son, a faithless husband, a brutal master, a

corrupt citizen." All phases of economic life are considered, even those which have to do with the effects of rampant commercialism. There is a chapter devoted to marriage and divorce, legacy hunters and childlessness.

My Story. By Tom L. Johnson. Edited by Elizabeth J. Hauser. New York: B. W. Huebsch. Pp. xxxiii, 326. $2.

Tom L. Johnson, Mayor of Cleveland. By Carl Lorenz. New York: A. S. Barnes Company. Pp. vi, 203. $1.

These two volumes, the one supplementing the other very happily, describe episodes in our municipal history the significance of which is now coming to be generally understood. For nine years Tom Johnson was mayor of Cleveland. He had in him something of the demagog and something of the prophet. He was a prophet because he brought into city politics, as Bryan brought into national politics, a vision of the new order of things. If his name is associated with three-cent fares, with the assertion of public rights against private interests, it is because he understood in some measure the direction which the struggle for the emancipation of the cities must take. And, as Mr. Lorenz says, most of the Johnson fads ("Johnsonisms") have been adopted by Democrats and Republicans alike. The story of his career is fascinating in itself, aside from its bearing on economic and political questions, showing, as it does, how the child of eleven who supported parents and brothers by selling newspapers grew to be several times a millionaire, the owner of street railways and steel mills and the rival of Mark Hanna. Having made his millions, he went into politics; not like Hanna, who adopted politics as an adjunct to business, but with the avowed object of making war upon the very class with which he had been identified. As Johnson dictated his book while he was actually dying, he often speaks with a frankness which is not found in such recent memoirs as those of Senator Platt or Senator Cullom. Something of his character appears in the narrative; and for the rest reliance may be placed upon the well balanced judgment of Mr. Lorenz. That character, with all its forcefulness and charm, had serious defects. Chief among these, perhaps, was personal ambition. Mr. Lorenz thinks it likely that "he espoused the cause of the people because it would serve him as a ladder to climb to high office. Being of a domineering spirit he naturally could not ally himself with men of his own class, but was rather prompted to rise in arms against them. Ambitious, he wanted to lead; curious, he espoused new things; without imagination, he entered politics. His declaration of love for the people had a false ring; yet he would serve them and fight for them with all his strength and power. . . . It was an unconscious self-deception." It will be seen that Mr. Lorenz writes with some spirit. Both books make delightful and, what is more, highly instructive reading.

Literary Notes

....E. P. Dutton & Co. are the publishers in this country of a fine volume containing more than two hundred and fifty artistic halftones illustrating *Romanesque Architecture in France*. It is edited and prefaced with a short, well-written introduction by Dr. Julius Baum.

....Those who have come to admire and profit by the brilliant scholarship and expositions of Prof. Nathaniel Schmidt, of Cornell, will welcome his biblical volume devoted to *The Messages of the Poets* (Scribners; $1.25), which includes introductions, metrical translations and paraphrases of the books of Job and Canticles, and some minor poems of the Old Testament. It is a book for the scholar as well as the general reader.

....Three new volumes of sermons published by Hodder & Stoughton come from men who have already appealed to wide circles of readers and whose writings have special power. The most popular and stirring of these volumes is *The Enterprise of Life* ($1.50), by Rev. J. R. P. Sclater, M. A., of Edinburgh, and the sermons are addressed largely to university students. Prof. J. Denney's forceful utterances in *The Way Everlasting* ($1.50) cover a wide range of topics, upon each one of which he has spoken with persuasiveness out of a large and fruitful experience. *The Spirit and the Bride*, by J. G. Simpson, Canon of St. Paul's, is composed of sermons in which special emphasis is placed on the doctrine of the Holy Spirit working in the Church. It is theological as well as practical in its bearing.

....The tendency toward a fuller use of biblical materials in the novel and the drama, and particularly the repeated attempts to express in these literary forms the spirit, teaching and personality of Christ are well set forth in *The Promise of the Christ-Age in Recent Literature* (Putnams), by William Eugene Mosher, Ph. D. Ten works, ranging from Lagerlöf's "Anti-Christ" to Hauptmann's "Emanuel Quint," and including Kennedy's "Servant in the House" and Fogazzaro's "Saint," are outlined and discussed.

....Rev. Dr. Cleland B. McAfee, who has recently been elected to a chair in the McCormick theological seminary of Chicago, has published the lectures he delivered early this year under the auspices of the Brooklyn Institute of Arts and Sciences on *The Greatest English Classic* (Harper; $1.25). Dr. McAfee gives a short sketch of the course of Bible translation from the original tongues thru the Latin into English and the story of the production of the King James version. The literary qualities of this version, its influence on both the form and substance of later English literature, and on the ethical, social and political ideals of modern England and America are engagingly set forth.

....The American Philosophical Association has projected a series of reprints of the works of early American philosophers which will be of interest to many readers and students. The first volume published consists of the *Lectures on Moral Philosophy* (Princeton University Press), by John Witherspoon, D. D., LL. D., one of the signers of the Declaration of Independence, and a president of Princeton University, then the College of New Jersey.

....Mrs. T. P. O'Connor, wife of the Nationalist member of Parliament for Liverpool, is an American woman, and she has written her *Reminiscences*. She describes therein meeting Henry James at a dinner. She had just come to London, and he asked her if she liked it—and answered his own question affirmatively.

"In London you were allowed every independence of opinion and action, only you must contribute something—beauty (and he bowed very courteously to me, and I bowed very prettily to him) or wit or agreeableness—and then London accepted you."

Whereat Mrs. O'Connor replied:

"History repeats itself. In Texas, where I was born, they say a man is not asked his nationality, his religion, or his politics, but only if he is a good fellow."

"Ah," said Mr. James, "then London is the Texas of Europe."

age a larger appreciation of the work of early writers and develop a consciousness of the historical background of our native American philosophy. President Witherspoon's lectures certainly make a good beginning.

....Prof. George Herbert Palmer, of Harvard, delivered without notes a course of lectures on *The Problems of Freedom* (Houghton Mifflin; $1.25) before the Lowell Institute of Boston in 1909. The lectures were fully reported, afterward revised, and are now published in a stimulating and delightful volume. The author's untechnical language, intimacy of style, and abundant use of illustration give lucidity and naturalness and even charm to discussions that would otherwise prove dull and unintelligible. One rejoices no less in Prof. Palmer's delicious "teleologic linkages" than in his gentle assurance that tho his own notions on related matters are in complete harmony his conclusions here made, he "sees no need of exacting such beliefs from his readers."

....Those who have been disturbed over the recent attempts to account for Christianity with its central figure left out may have their fears allayed by a careful reading of the extended discussion of the questions involved in *The Historicity of Jesus* (University of Chicago Press; $1.50), by Prof. Shirley Jackson Case. The criticisms and arguments are directed largely against Drews and Smith, and the evidence for the historicity and life of Jesus are drawn from Paul, the Gospels and outside sources. Prof. Case does not emphasize at all what seem to us two of the strongest arguments for historicity, viz., the peculiar development in the New Testament documents and the silence of the early opponents of Christianity. The volume is, however, a worthy contribution to the literature of the subject.

....The third volume of the extensive work on *Lollardy and the Reformation in England* (Macmillan; $3.50), by James Gairdner, C. B., LL. D., D. Litt., deals with the short period covered by the reign of Edward VI. The author continues, in accordance with the purpose of the preceding volumes, to show how the spirit of Lollardy, under the name of the New Learning and other guises, was used and abandoned by ambitious leaders as political expediency dictated in the struggle to overthrow papal power and establish local despotism. In spite of Dr. Gairdner's great learning one feels that he has not sustained his contention that Lollardy, which later appeared in the garb of Puritanism, was largely the mistaken fervor "of half-instructed men," and influenced the Reformation for ill rather than good.

....However much we may be tempted to disagree emphatically with the art practice of Mr. Gordon Craig we cannot but heartily sympathize with his art philosophy. *On the Art of the Theater* (Chicago: Browne's Bookstore) is a good book for idealists disgusted with the customary practices of the stage. Here is an iconoclast who does not waste time preparing ways for retreat; he burns all of his bridges behind him, nor does he care how many follow him. He knows, for example, that none at present will accept his belief that the *written* play is of no deep and lasting value to the art of the theater, but if he has done no more than make us realize the imaginative value that lies in mass, he has done much; and if he has in a new way shown us that there is a difference between natural or unnatural action and necessary or unnecessary action, he deserves our thanks. His book is uneven in its form and arrangement. There are Socratic dialogs and short essays on Shakespeare. But it is in the first half of this book that we are most likely to catch the fervor of Mr. Craig. The designs drawn by himself show the oddity of his ideas, but that he has a social understanding of the theater, that he comprehends what makes a work of art, cannot be doubted.

....The series of publications of the Field Museum of Natural History is increased by four volumes, of which two are the fruit of the McCormick Hopi Expedition, both by H. R. Voth. They describe, with figures, the ceremonies of this tribe of American Indians. A third volume, by Herbert F. de Cou, describes antiquities from Boscoreale, at the foot of Mount Vesuvius. Many of the objects described and figured are in the Field Museum, and they supplement those found in Pompeii and Herculaneum. Mr. De Cou was killed by Arabs in Cyrene while in the work of the American excavations there. The fourth volume, a stout book with a multitude of plates and figures, is entitled *Jade, A Study in Chinese Archæology and Religion*, and is by Berthold Laufer. It is the first of a series of volumes which will be the fruit of an expedition to China and Tibet carried on by the gift of Mrs. T. B. Blackstone. The specimens of jade described are mostly in the Field Museum, collected by the expedition, and the discussion of them covers their mythological meaning, and their use as ornaments, amulets and vessels of use. To a student of jade this work will be of intense interest, and it supplements Bishop's great work on Chinese jade as shown in the Bishop Collection in the Metropolitan Museum. Exactly what jade includes we do not here discuss, but we note that some of the jade ancient chisels figured can be duplicated by jade, or jadeite objects found in Asia Minor.

Pebbles

THE affirmative ticket: WILL-son and Mar-SHALL.

A DAKOTA court is struggling with a prisoner named Szczyz. We don't know what he is charged with; but, from his name, we suspect it is soda-water.—*Chicago Dispatch.*

THO hope has oft his heart deceived
And checked his wild elation,
'Gene Chafin has again received
The Prohib. nomination.
—*Cleveland Plain Dealer.*

HE rose to speak, and as he rose
No man on earth was prouder;
But those who listened only heard
One oft-repeated, hateful word—
Or so he thought it—"LOUDER!"
—*Chicago Record-Herald.*

A LITTLE girl was reading a composition of her own on "Grant's Work in the Civil War." She got on swimmingly until she reached Lee's surrender at Appomatox Court House. Then she told how Lee wore his sword and was handsomely attired in full uniform; "while Grant," she announced, "had on nothing but an old, ragged union suit."—*Ladies' Home Journal.*

"LOTS of politics around," said the anxious-looking man to the complacent man with a newspaper on his knees in the street car.

"Plenty, sir—plenty," was the reply.

"Would you mind telling me how you think it will turn out?"

"I think we will get there with both feet."

"You do?"

"I certainly do. There is a wave of enthusiasm that is carrying him right along."

"Why I didn't think he stood any show at all."

"No? Well you wait."

"I was told that the West was against him."

"My dear man, the West is for him bigger'n a house."

"But New England?"

"Whipping right into line. You don't seem to be up-to-date on the political situation."

"No, I don't read very much. Do you think the election will be close?"

"No, sir. He will have a thundering majority. No, there won't be any dispute as to the election. The country has made up its mind."

The anxious-looking man pondered for a moment, and then said:

"Come to think of it, you have mentioned no names. You have asserted that 'he' would get there."

"And 'he' certainly will."

"But do you refer to Taft or Roosevelt?"

"My dear man, I am a lawyer, and my regular fee for answering that question is $25 Do you wish it answered?"

"No, by thunder!" exclaimed the other. "I can go to a clairvoyant and get an answer for fifty cents!"—*New Orleans Picayune.*

The Independent

Entered at New York Post Office as Second Class Matter
Publisher, Clarence W. Bowen
130 Fulton Street - - - - New York

A WEEKLY MAGAZINE FOUNDED IN 1848
One Year, $3.00 Single Copies, 10 Cents

Single copies over six months old, 25 cents. Postage to any foreign country in the Universal Postal Union, $1.75 a year extra; to Canada, $1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as those offered by any responsible agency.

An order for the change of an address should be received two weeks before the change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of the publisher's price any book reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with $1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. Even so, we cannot hold ourselves responsible for their return. Authors should preserve copies of their manuscripts.

Advertising rates will be furnished on application.

The New Party's Platform

MR. ROOSEVELT has been at work on the platform of his new party. We have said that, as he is to be the party's candidate for the Presidency, there must be somewhere in this platform the assertion that he is entitled to a third term and is the first American who has deserved to hold that office for more than eight years. A demand for the recall of court decisions may be expected, of course, and a denunciation of the Republican convention for declining to give him a nomination. Thus far there have been very few signs to show what the remainder of the platform will be. Mr. Frank A. Munsey, who has vigorously and continuously supported the ex-President in his newspapers and by his purse, has in mind the tariff plank when he says:

"Mr. Roosevelt will make the fight of his life for the industrial and business and commercial supremacy of America. He will make the fight of his life aganst the false economic theories of the Democratic party, against the ultra-radicalism of the Democratic party. He will make the fight of his life for the supremacy of the American wage, for the protection of American industries and the protection of our American markets."

But Mr. Roosevelt recently permitted it to be known that he is in favor of a downward revision of the tariff. He supported the stand-pat New York platform of 1910, and in several public addresses he has warmly commended President Taft's plan of revising the tariff by means of information obtained by a board of experts.

The resignation of Herbert Knox Smith, Commissioner of Corporations, who gave up his office in order that he might join the new Roosevelt party and work for it, may throw some light upon the Trust policy of the platform. Mr. Smith said, in his letter of resignation, that the new party "movement includes the principles that I believe in and that I have earnestly tried to further, so far as I could, during my term of Federal service." Now, this gentleman had been engaged for several years in making investigations and preparing reports concerning the great combinations which are commonly called Trusts. He had made an inquiry about the Harvester Trust, in which George W. Perkins was and still is deeply interested as an officer and a stockholder. It had practically been decided by the Department of Justice that this Trust should be prosecuted for violation of the Sherman act. Mr. Perkins, Mr. McCormick and others influential with respect to the affairs of the menaced corporation, made strenuous objection. This was in 1907. Commissioner Smith sent to President Roosevelt a long letter in which he argued that there ought to be no prosecution. He said:

"I feel that the starting of a suit under the Sherman law against this company would, in the first place, be a moral injustice, and, in the second place, would be a reversal of the correct and advanced modern policy of the President in dealing with corporate business. . . . It is a very practical question whether it is well to throw away now the great influence of the so-called Morgan interests, which up to this time have supported the advanced policy of the Administration."

President Roosevelt wrote to Attorney General Bonaparte, asking him to "see Mr. Perkins and Commissioner Smith and go over the matter in full." He added, "Please do not file the suit until I hear from you." And no suit was filed.

Mr. Perkins has recently been the most active and prominent supporter of Mr.

Roosevelt's candidacy. He contributed generously to the campaign fund for the primaries, and is now in charge of Mr. Roosevelt's interests in certain Western States. Mr. Smith has now joined him in the work.

We suppose that Mr. Smith prefers regulation of Trust combinations by Federal authority to a stern and impartial enforcement of the Sherman act. But so long as the law exists it should be enforced without favoritism. Mr. Roosevelt would have supervision and regulation by a commission; so would President Taft. So far as the former's attitude can now be ascertained, the policies of the two men as to this subject are not far apart. Mr. Perkins, however, prefers Mr. Roosevelt's, and Mr. Smith stands with him.

At a convention of the new party in Michigan, last week, a platform was adopted which is said to have been approved by Mr. Roosevelt. It begins with a denunciation of the "fraud" and "cheating" at Chicago, and of the "unholy alliance of crooked business with crooked bosses." It calls for the initiative, the referendum, the recall, direct nominations, direct election of Senators, equalization of tax burdens, a parcels post, an extension of the postal savings bank system, government ownership of express and telegraph service, a physical valuation of railroad property, more power for the Interstate Commerce Commission, extension of the civil service law to the consular service, equal suffrage, conservation of natural resources, and "severance of the diplomatic service from such financial interests as are seeking to exploit defenseless nations." The "Aldrich currency scheme is opposed. Concerning Trusts and the tariff the platform says:

"The Federal regulation of all corporations engaged in interstate business, and the prohibition of the creation of artificial values by watered stocks and bonds.

"The maintenance of a protective tariff for the benefit of the industries and the laboring men of the United States, except where competition in trade has been destroyed by monopoly, and the tariff is used to exact an unjust tribute from the people and unjustly increases the cost of living."

Much of this is good. Parts of it have been supported by one or the other of the two great parties. But the declarations about certain very prominent subjects are not sufficiently specific. So far as the civil service is concerned, Mr. Taft would go far beyond the suggestions of this platform, and his attempts to better the condition of Central American countries by means of guarded loans should not be disapproved. To what extent this Michigan declaration foreshadows Mr. Roosevelt's national platform we do not know, but we shall not be surprised to find more radical propositions added when the final platform is made known. Press dispatches from Oyster Bay, speaking of Mr. Smith's action and of the aid he will give in shaping and defining the new party's policy concerning Trusts, also say:

"With other issues which will be made prominent in the Roosevelt campaign he will be able to render great assistance. He is an authority, the Colonel says, on old age pensions, minimum wage laws and similar subjects, and he is ready to go on the stump for the new party."

Does this foreshadow a demand in the national platform for old age pensions, minimum wage laws, and wage-earners' insurance?

Panama Tolls

THE reader of this owns a ninety-millionth undivided interest in a piece of tropical land, ten miles wide by fifty miles long, and he has recently had invested in his name some $4 in the construction work being carried on there. The question now up to the reader and under discussion by his Washington agents who have charge of the property is whether he should get back the money he has put into the enterprise, or draw interest on it, or charge it off to "charity" and let it go at that. Even if the last course is decided upon, the perplexity continues, for there are so many worthy objects in need of it. For instance, there is the American merchant marine; or if there is not, there ought to be, and, say some, there might be if we —the reader, the editor and our partners in the concern—will chip in enough to make up the difference between profit and loss. This is an appeal that engages

our sympathies. We should be glad to see our flag in every port or to read that it is there even tho we cannot afford to go and see it. But on the other hand, the American merchant marine we have always with us, or the need of it, and we can contribute to it at any time. Would it not be best to keep our business distinct from our benevolence, and see first whether we are going to get any profit out of our investment before we decide what use to put it to?

There are two provisions in the bill now pending in the Senate which free American vessels from the canal tolls. One emanating from the House states that:

"No tolls shall be levied upon vessels engaged in the coastwise trade of the Unitel States."

The other, added by the Senate Committee on Interoceanic Canals, reads:

"No tolls shall be levied upon vessels of American registry engaged in the foreign trade if the owners agree that such vessels may be taken and used by the United States in time of war or other public emergency, in the discretion of the President, upon full payment to the owners of the fair actual value at the time of taking."

Of course, any vessel of American registry may be taken by the United States in time of war, whether the owners agree to it or not, so the two clauses taken together mean simply that American ships engaged in either foreign or coastwise trade may go thru the canal free.

This proposed discrimination has naturally aroused the opposition of other countries, and they have been impertinent enough to quote from our official utterances numerous assurances, from 1826 to the present, that the privileges of the canal were to be extended to all nations on terms of equality. We might, of course, disregard these protests and quotations by saying that we didn't mean it, or that we had changed our mind, or something of the kind, but unluckily our name is signed to a document which is binding in this case; that is, the Hay-Pauncefote treaty with Great Britain of 1902. This states explicitly that:

"The canal shall be free and open to the vessels of commerce and of war of all nations observing these rules [the rules for the free navigation of the Suez Canal], on terms of entire equality, so that there shall be no discrimination against any such nation or its citizens or subjects, in respect to the conditions or charges of traffic or otherwise. Such conditions and charges of traffic shall be just and equitable."

Now, how can we get around that? It would take a smart lawyer to do it. We have some smart lawyers in the Senate and they are trying to do it, but they are having a hard time of it. Senator Lodge says "all nations" means "all other nations." Senator O'Gorman thinks it quite incredible a treaty should have been adopted that restricts our right to free our own ships from tolls. But that question was raised when the treaty was under consideration, and the Senate voted by 43 to 27 *not* to include the following clause:

"The United States reserves the right in the regulation and management of the canal to discriminate in respect to the charges of traffic in favor of vessels of its own citizens engaged in the coastwise trade."

The reason why it was struck out was because Great Britain would never have accepted it, and so we should never have had a chance to dig the canal.

In 1892 Canada tried to do just what some of our Senators want us to do now, that is, rebates were granted to Canadian vessels using the Welland Canal. We threatened retaliation and Canada was compelled to revoke the rebate.

It is true that Austria, Russia and Sweden do grant subsidies to their vessels using the Suez Canal that are practically equivalent to the tolls, and that the payments made by Great Britain for carrying the mails to India are sometimes suspiciously close to the charges paid by these vessels for the passage of the Suez Canal; but it must be remembered that the British Government does not own the Suez Canal or a controlling share in it.

But this matter of subsidies may be taken up later. The thing to do now is to free the Panama Canal bill from these troublesome clauses and pass it promptly. Then we can consider on its own merits the question of subsidies to American shipping of all kinds. This will have the advantage of making it clear that the proposed exemption from tolls is really a form of subsidy, just as much as if the money were raised by direct taxation and paid over to the shipowners.

Race Questions at the Olympic

THERE has been a worldwide athletic competition held at Stockholm, and the King of Sweden awarded prizes to the victors. So much seems to be generally agreed upon by the papers, but when it comes to the questions of who or what were in competition at Stockholm, and what kind of superiority was demonstrated by the successful contestants, there is the widest diversity of opinion. "Everybody said that 'twas a famous victory," but as to its significance, we are as much at sea as old Kaspar. It is a rule of the laboratory that an experiment must be so arranged as to decide only one point. In the Olympic games there were too many factors involved to be solved by a single equation. It was a contest between individuals, trainers, countries and races, all at the same time.

Of these the most important factor was undoubtedly individuality. It was essentially one man against the field, the field being the world. The competitors were not average, typical or representative men. They were all picked men, picked as individuals because of their exceptional natural endowments. As a consequence of this method of selection, the roll of prize winners reads like a list of the greatest authors, artists, scientists or statesmen of the world; that is, names of all nationalities occur in it. When we get above a certain level the boundaries between countries disappear. It is evident from this physical competition, as it is in any other field of human endeavor, that the differences between individuals of the same race or land are vastly greater than the differences between the average of different races or lands. It is not possible to draw any conclusion whatever from the Olympic games as to the relative physical stamina of the various countries, taken as a whole or on the average. It is not even possible to decide with any degree of assurance the allied and equally important question, whether any one country is superior to another in the number of these exceptional individuals in proportion to the population. The high standing of Sweden and Finland is astonishing, even after making what seems to be the proper allowance for the place of meeting and the attention paid to gymnastics in these countries. The examination of a biographical dictionary will show the same disproportionate superiority in science, art and literature. So it appears probable that the Scandinavian races do produce more than their share of great men.

The English papers, in refutation of the inference that the low position of Great Britain implies degeneracy of the race, lay stress upon the advantages of the American system of training, which a few years ago they condemned as indicating an ungentlemanly zeal to win. It may indeed be questioned whether it is worth while to spend so much money and time in training a few gifted men to do exceptionally well something unimportant in itself, but it is evident that the way to win in sport is to make it a business. Applied science counts here, as in everything else, and the penalty for neglecting it is failure. Another important element in the American success is the wide range of selection without regard to class, wealth, race, color or previous condition of servitude. In both England and America the athletic champions mostly come from the colleges, but in England the universities and "public schools" which devote most attention to sports are so hedged about by social and pecuniary restrictions as sometimes to shut out the best of the nation. It is clear that in the physical, as in the intellectual, field a large net flung wide will gather in bigger fish as well as more of them.

The modern Olympic meet is chiefly regarded as a contest between nations, and here the disappointment of the English is especially humiliating, because they were the first to insist that success in sports is a measure of national greatness—Waterloo was won on the cricket field, and so forth. The colonials made proportionally a better showing than did the British Isles, and there is a growing disposition to include their exploits with those of the mother country. This Olympic is leading the English to "think imperially" more than any other event since the Boer War, when they "fawned on the Younger Nations for the men who could shoot and ride." Perhaps at the next Olympic the whole British Em-

pire may compete as one country. If that had been done this time, "Greater Britain" would have won second place.

The United States alone came near scoring as many points as the rest of the world put together, and if we add in the points won by Great Britain and her colonies it is evident that the English-speaking countries can "lick all creation." But that we must not call such a combination "the Anglo-Saxon race" is manifest by a glance at the list of prize winners. The United States owes its supremacy over all other nations to the fact that it is a union of all races. The men in whom we take pride have not only English, Scotch, Welsh and Irish blood in their veins, but Scandinavian, Russian, German, Italian, Hawaiian, Indian and other blood as well. If the Old World claims all that she originally sent to us, America has still the Carlisle Indians, and among them James Thorpe, the greatest all-round athlete of the world. But no; we rightfully lay claim to all those sheltered under our flag, many of them despised and rejected of their native lands. When an Italian from Paterson, N. J., kills a king we get the blame. Shall we not then get the praise when an Italian from Paterson, N. J., wins a race?

Whether such international competitions do much to promote good feeling between different countries is doubtful, for they often have the opposite effect. But they are of benefit in proving how artificial, accidental and unessential are the distinctions which we draw and go to such great trouble to maintain between nation and nation or between race and race. On the level of the Stockholm stadium met men from many lands and proved so nearly equal that the chronometer and the camera had to be employed to detect any difference. Finland and Hawaii were brought together, and it was hard to tell which was the better, he upon whom the sun had shone at midnight or he over whom the sun had stood at noon.

"Oh, East is East, and West is West, and never the twain shall meet,
Till Earth and Sky stand presently at God's great Judgment Seat;
But there is neither East nor West, Border, nor Breed nor Birth,
When two strong men stand face to face, tho they come from the ends of the earth."

Passenger Traffic Conditions

How much of actual benefit the American people will derive from the jurisdiction of the Interstate Commerce Commission over the express companies and their business can only be guessed at. The companies will probably fight a reduction of rates, and it is doubtful if the minds that control them have enough grasp of the social situation to realize that they could make a larger aggregate profit between now and the time when parcel carrying will become a governmental function by treating the public liberally than by being disagreeable and extortionate.

There is, however, some encouragement in the action of the Interstate Commerce Commission itself. Perhaps it is not preposterous to hope that some day the commission will give a measure of attention to passenger traffic conditions.

In many particulars these conditions are more unsatisfactory now than they have been in a generation. The fundamental requirement of safety is notoriously not met. The slaughter of passengers by collisions and derailments in recent years has been shocking and inexcusable. The less essential but highly important requirement of comfort is not met. Neither Pullmans nor day coaches are kept properly clean, and on many lines passengers are subjected to ceaseless annoyance by the bawling and going to and fro of the train peddler with his magazines, candies and gimcracks, on all of which, it is understood, the railroad company itself pockets the major part of what profit may be forthcoming. It is possible that a majority of passengers wish to be able to obtain such things after boarding the trains, tho we doubt it; but certainly they do not wish to be continually pestered and yelled at, as they are, for example, on one of the principal lines going out of New York City.

The dining car service, by universal testimony, is in almost every respect inferior to the service ten years ago, and this not only east of Chicago, but also thruout the West, which formerly boasted of its superiority over the East in this respect. The advancing prices of food have of course increased the cost of the service, but that does not constitute a

reason why the passenger who "has the price" should often be unable to get anything fit to eat on any terms at all. By fit to eat we mean food that is fresh and served in a cleanly way. The greater part of the stuff set before passengers at present is too obviously of the canned and cold storage description. Another abuse, of long standing, is the practical impossibility of getting a few simple, well-cooked things in reasonable quantities. As a rule, the passenger is still compelled to buy and pay for larger portions than he wants, with the result that enough food is wasted on every dining-car trip to reduce prices materially without curtailing the company's profits if the business was economically managed by competent brains.

On the economic side, however, the crowning abuse of present-day passenger service is the shameful injustice of making the poorer passengers pay for the luxuries of the rich. This outrage has been systematically worked up by the railroads for years, and practically it has been curtailed by legislation only to the extent of cutting down the rich man's old-time free-pass privileges. In the other large items of fast and luxuriously equipped trains that do not pay, and which therefore are necessarily paid for out of the proceeds of the carriage of relatively humble folk, the abuse is getting worse. The latest hold-up device has this summer gone into effect between New York and Chicago. On certain roads it is now impossible to make this trip without paying an extra fare of five or six dollars, unless one is prepared to submit to the loss of time and deliberately contrived annoyances of trains that are stopped at the greatest possible number of way stations, apparently for the express purpose of making them undesirable.

That American railroad officials should continue to talk the old bluff about the superiority of our railroad service, "built up and maintained by private enterprise," over the service of the state railroads of Europe, is natural enough. It is a part of their job; they are paid for it. But if any passenger who in recent years has traveled on both American and Prussian railroads gives forth such remarks, he lays himself open to suspicion of his intelligence or his moral integrity.

Wanted: Good Farmers

ONE of the greatest needs of the United States is an abundance of good farmers.

Every year hundreds of thousands of Americans, journeying between New York and Chicago, have a remarkable opportunity to observe from their Pullman windows the difference between good farming and poor. Going one way thru Ohio and Pennsylvania, and the other way thru Canada from Buffalo to Detroit, it is necessary only to look for obvious things to learn the indifferent way of our own fellow citizens of the agricultural vocation and the painstaking thrift of our British-American neighbors.

South of Lake Erie litter and disorder about barns, houses and outbuildings, hedges of weeds and bushes along the fence lines, and unsheltered farm machinery, tell of the farmer who either has never been properly trained to his work, or whose mind is on something else than the careful administration of his domain. North of Lake Erie one rolls thru mile after mile of beautifully tilled fields, noting fences and buildings in perfect repair and field boundaries absolutely clean. The shrubs and bushes that stand have been kept for a purpose, not thru negligence or because of inadequate energy to use the brush-hook.

On the Canadian side of the lake live stock is abundant. Sheep, cattle and horses, always in the landscape, give evidence that the farmers there have learned how impossible it is without live stock to keep up the fertility and productiveness of their acres. South of the lake, except in specialized areas, like the grape-growing region about Cleveland, the old land skinning game goes merrily on.

The Mohawk Valley and the valley of the Ohio were once the potential garden of the world. Enormous crops of wheat could be raised there, as now in the Red River Valley of North Dakota. The land skinner exploited them and then moved on to the prairies of Illinois and Iowa. Having exhausted in those States

also the possibilities of making fortunes out of nothing, he is now pushing into the great Northwest of Canada. We have heard laments over the departure of American farmers from Iowa and have read the Canadian newspaper rejoicings as the Iowans have crossed the border. Lamentations and rejoicings are both misplaced. The United States should view the departure of land skinners with something better than equanimity. Canada will rue their enterprise.

Good farming is coming in this country, but slowly. From New England thru the Middle West and into the Dakotas and Montana it is making its way, partly thru the influence of the agricultural colleges and experimental stations, partly thru the coming of people who know how to farm and are willing to put the necessary thought and labor into their vocation to carry it on properly.

The virtues of the old American stock were many, and we are among those who sincerely hope that it has left an enduring intellectual and moral influence upon the larger American people that is now in the making. But it would not be truthful to maintain that the old stock consisted largely of exemplary farmers, tho most of it nominally followed agriculture as an occupation. The American has been a land speculator, a land exploiter, a forest destroyer, a mining speculator and a stock speculator, but not, as a rule, a thrifty, patient, practical, scientific far-seeing farmer. A great population of really good farmers would mean more for the material and moral prosperity of this country than almost any other one thing that could be named.

Negro Public Schools

In more than a dozen States of the Union, it is the accepted principle of the dominant political party that there must be no social relations between the white and the colored citizens. Therefore the children of the two races must be separated in the public schools; there must be a dual school system, one portion white, the other colored, and both controlled by the white section of the people, who are the sole ruling element; for, for the most part, the colored citizens have been deprived of the ballot by cunning devices of law.

Be it remembered that in these States the public school system was imposed upon them by the result of the Civil War. There was no such system before the war, when the negroes were slaves, and forbidden to learn to read. When the public school system was organized they were utterly illiterate, and so were multitudes of the whites. The beneficent purpose of the new measure established by the new constitutions was to give a common school education to the children of these people, white and black, to the blacks as well as the whites, for they needed it the most.

Over forty-five years have now past, and it is well that we should consider what the result has been. Beyond question, these States have all accepted the school system imposed upon them. It has been a blessing to both races. Illiteracy has progressively diminished. But it is a fact undeniable that it has been adopted and administered mainly in the interest of the white people, who had, to begin with, more intelligence and practically all the wealth, and only meagerly and begrudgingly in the interests of the negroes, who needed it most. This conclusion is forced upon one who reads the reports and statistics gathered in a social study made by Atlanta University, by the patronage of the John F. Slater Fund, and edited by Professor Du Bois, under the title "The Common School and the Negro American." We give some facts thus gathered from official reports, which explain the poor condition of the negro public schools and the failure of the system to give them a proper education.

In 1909, South Carolina counted 201,868 white children of school age, for whose education was expended $1,590,733; while for 316,007 negro children was expended only $308,153. In the same year Alabama spent $2,143,662 for her 364,266 white children, and $287,045 for her 311,552 negro children. There is much the same discrimination in all the old slave States, except Missouri and Texas. South Carolina spent $10.36 on each white child and $1.70 on each negro child. In Charleston, the white children received $35.70 a head, and the negro

children $2.55. Is that a square deal? Is it strange if the negro rises slowly? The white schools of South Carolina ran twenty-five weeks; the negro schools fifteen weeks. White schoolhouses were built in 1909 costing $255,181, and colored costing $7,062. Again, is that a square deal? In Georgia the two races are almost equal in numbers; the whites in 1909 had 4,560 schools, and the colored 2,803. The white schools had 7,384 teachers; the colored 3,512. In South Carolina the average salary paid a white woman teacher was $249; that paid a colored woman teacher was $91. In Alabama the average monthly salary of male white teachers was $60.63; of colored, $27.18. The average of white women teachers was $45.65; of colored, $24. To such discrimination there are honorable exceptions, particularly in Washington, and to a less extent in Baltimore, St. Louis and the States of Texas and West Virginia.

Louisiana affords us instructive figures taken from the report of the Department of Education. The population in 1910 was 941,125 whites and 713,874 colored. The average length of session of the white elementary schools was 7.64 months; of the colored 4.6. The white teachers received $2,404,063 and the colored $202,251. There were 5,001 white teachers employed, and 1,285 colored. While the white male teachers received an average monthly salary of $75.29 the colored teacher received $34.25. The value of school property, buildings, furniture, libraries, etc., for whites is $7,539,145, and for colored $266,281. Is this a square deal?

The supervision of the colored schools is in the hands of county superintendents who are frequently incompetent or hostile. Mr. W. K. Tate, State supervisor of elementary rural schools in South Carolina says:

"The negro schools of South Carolina are for the most part without supervision of any kind. Frequently the county superintendent does not know where they are located, and sometimes the district board cannot tell where the negro school is taught."

The fact that not too much education for negroes is desired in many quarters came out in the answers to questions sent to the superintendents in 262 cities in fourteen Southern States. The answers on the whole show progress, altho complaint is made of the imperfect technical equipment of colored teachers. This is not strange considering that the public schools have so low a curriculum that they cannot supply teachers, and the pay is so low that it does not attract those educated in the higher private schools. Outside of Washington, Baltimore, St. Louis, Kansas City, Dallas and Houston there is practically not one fairly equipt high school for negroes in all the old South. Atlanta, with a negro population of 51,902; Savannah, with 33,246, and Augusta with 18,344, all in Georgia, have no high school, and colored youths who wish to become teachers have to pay for their private schooling. The negro pays taxes for white high schools, but has none for his own children. There is not in Georgia one colored high school with a four years' course above the eighth grade, and only four towns have any work at all above the eighth grade. Georgia has established an agricultural high school for white boys in every Congressional district, but none for negroes, altho they form over 45 per cent. of the population and live in the rural districts.

The answers of the city superintendents show that many of them care much less for technical education than they do for the teaching of cooking, sewing, laundry, carpentry, etc. Where the single teacher has to attend to these things in the lower grades, the essential reading, writing and ciphering must suffer. Many superintendents dislike a teacher with too much "egotism" or "individuality," who will not teach the negro "to know his place," and they prefer the half-trained scholar of an industrial school, and will then complain that the teacher "lacks culture." To illustrate the kind of teachers sometimes preferred there is given this reprint of a note received from the teacher of the largest colored school in a Georgia county; she teaches over 100 scholars and has $14 a month salary:

"may 12, 1912.

"Prof —— —. I drop yo this card to let yo know that I will be in on that early train munday morning tell mrs. markus to meet the train.

"Yours —— ——."

What might be expected from prepossessions we have an example of in the answer from the superintendent of Bowling Green, Ky.:

"*Defects:* Their race and blood are against them. They lack originality and initiative. *Opinion:* They are doing some good, but not an amount commensurate with the time and money. They should have more training in agriculture, manual and domestic science."

This from Covington, Ky.:

"*Defects:* Lack of accurate scholarship and professional courtesy. *Opinion:* In upper grades more attention needs to be given to industrial and vocational, less to the purely academic studies."

From New Orleans the superintendent advises that the public school "should be vocational after the fourth grade." This is from Cape Girardeau, Mo.: "Work should be almost wholly industrial"; from Lexington, Mo., "Too much time spent on things that are not practical. Need of more industrial training"; at Abbeville, S. C., "More domestic work is wanted, even at the expense of high school work." There are many such "opinions," but the number of those superintendents who show intelligent sympathy and recognize improvement under handicaps is large.

A radical and fair improvement in the negro public schools is not to be expected so long as negroes are to so great an extent excluded from the ballot by restrictive laws in Virginia, North Carolina, South Carolina, Alabama, Georgia, Mississippi and Louisiana. The latter State has 152,135 registered white voters and but 1,743 registered colored voters. The lower class of whites does not wish negro suffrage or negro schools lest negroes should equal or surpass them. In Pulaski County, Ga., five negro school buildings were burned in 1909 by incendiary fires, and they have been frequent in the Gulf States. In Alabama the average length of negro public schools was reduced from 95 days to 92 in 1908, and then to 90 in 1910, while the average salary paid negro teachers was also reduced. There is a constant attempt to reduce the number of grades in the negro public schools. And yet, thruout most of the South, the negro taxes, direct and indirect, not only support their own schools, but supplement the white schools, as has been admitted by Southern State superintendents.

Andrew Lang

Andrew Lang, who died died July 21, at the age of sixty-eight, was one of the most versatile and voluminous of English authors. He was often referred to as "the syndicate," because it seemed incredible that so many critiques, translations, introductions, poems, histories and miscellaneous articles could come from a single pen. But however dry or recondite the subject, he never failed to enliven it by his characteristic humor and graceful literary style. What a pity that such a man when he leaves the world could not bequeath to some one his well-stored brain. This is a trite thought, but one that must recur when we think that such an accumulation of historical, biographical, bibliographical, literary and legendary lore has never before been gathered into one mind and never will be again. It is a unique collection that the world has now lost. In the eighties Mr. Lang contributed to THE INDEPENDENT "Letters on Literature" almost every week, and in recent years we have had the following articles from his pen: "The Crime of Jasper," September 14, 1905; "The Poets' Trade Union," May 17, 1906; "The 'Occult' Up to Date," November 8, 1906; "The Romance of Lost Heirs," December 13, 1906; "Mr. Lang's Ghost," January 24, 1907; "Hawthorne's Tales of Old Greece," April 4, 1907; "St. Andrew's Links," June 18, 1908; "The Humors of Collecting," June 16, 1910; "A New Theory of Shakespeare," December 22, 1910; "Dr. Hempl's Discovery," February 9, 1911; "Fear and Ghosts," March 21, 1912.

Horse Breeding

Secretary Wilson goes so far as to propose to take charge of an effort to reconstruct the Morgan breed of horses. This breed has been allowed to almost entirely lapse, but it is said to have been the nearest to a complete home and farm animal ever produced. The English Government is in somewhat the same fix. It has recently made a grant of $200,000 to a development committee, to be used for the breeding of light horses. The United Kingdom has been sold out of the genuine English home and carriage horse. The money will be distributed during the year in the way of

King's premiums. Thorobred stallions, with a certificate of soundness, will be offered to the farmers, and the object will be to establish an English breed that will be serviceable for driving, for farm work, and as a general utility horse in English families. The object will not be to create a racer, but a thoroly healthy, handsome and useful animal. The American people are as deeply interested as the English people in this creation, or if it be to bring back the Morgan, this recreation of a thoroly beautiful and useful and healthy family horse. Instead of abolishing the horse, the automobile has put out of use the scrub, and made much stronger the demand for a more ideal home animal. The race horse is a marvel in its way, but it is not the horse for the common people. The Arabs alone have so far been able to secure in the horse a companion, a friend and co-operator.

The Value of a Vote

How much is the franchise worth? Apparently that depends upon whether you have it or not. In England we see women willing to starve for it. They throw stones and hatchets at Premier Asquith because he will not give it to them, and yet he incidentally disclosed the fact in Parliament the other day that he did not regard it as worth $100. For that sum he could have purchased the right to cast a vote for another representative in Parliament, that of Oxford University. Mr. Asquith is a B. A. of Oxford, but the price at which the M. A. is sold is "a very substantial sum of money for a young man and a poor man," and he has "never since been tempted to incur the otiose expenditure." Yet his vote for the Oxford M. P. would doubtless be more influential than the three or more other franchises that he possesses elsewhere, because the number of electors, Oxford M. A.'s, is not large. Since he does not want this vote himself what a pity that he cannot sell it to Mrs. Pankhurst, who would very likely pay the $100 and a bit extra for the right. But altho the Premier is unwilling to grant the franchise to women he is earnestly striving to rectify some of the lesser injustices of the British electoral law. The bill he is now pushing thru Parliament will give the ballot to about 2,000,000 men who are now disfranchised and will take away the extra votes from those who, on account of having property in different places or possessing university degrees, have now the right of plural voting.

A Bad Investment

Ledgers recently discovered at Palos, Spain, show that the amount spent by Columbus in fitting out the expedition with which he discovered the New World was about $7,000. Since money went further in those days this is equivalent to about ten times that sum, or $70,000, according to our present standard of values. At any rate, it was too big a price to pay for the property. We do not mean to say anything against America. It is a nice enough place in its way. But it was not worth what was paid for it, as any schoolboy will see at a glance. For if Queen Isabella, instead of pawning her jewels to invest in this Wild West scheme, as women will, had put the money into a savings bank at 4 per cent. compounded semi-annually or into gilt-edged securities paying that rate (your banker will furnish you a list of them), it would by this time have amounted to $587,202,560,000. Now the total wealth of the United States is only $130,000,000,000, and if we call the rest of America worth as much again we see that Spain would have lost $327,202,560,000 thru that careless speculation of her revered sovereign, even if she had kept hold of the property. Since, however, the land was in the course of time all preempted by the squatters, Spain lost the title to it, so the six hundred billion dollars in round numbers was a total sacrifice. If Spain had that money now that country would be a hundred times richer than it is. Let this be a lesson to us all not to invest in distant real estate, no matter how cheap it seems to be at the time.

The Mote and the Beam

British newspapers are loud in their scorn of the crime, graft and degeneracy of America because an ex-race-track gambler was shot by some of his pals at the entrance to one of the principal hotels in New York and the murderers, strolling across the street, rode away in an automobile. Such a thing could not happen under the Union Jack,

we hear. That is true. But why? Because the crime of which Rosenthal and his murderers are alike guilty is in England and His Majesty's dominions beyond the seas not regarded as any crime at all, but an established custom and popular pastime. The trouble arose from the enforcement of the New York law prohibiting betting on the races. The gamblers finding their occupation gone quarreled with each other and one of them turned informer. Now in England Rosenthal would have continued to practise his profession with the approval of the public. He might by reason of it have been admitted into the sacred circle of the aristocracy and even basked in the smiles of royalty. Some years ago when the King of England appeared in court (police court) as witness in a gambling case it was not because he had been gambling and had provided the apparatus and served as dealer. No, that was all right, but some of his set had gone a bit further and cheated at the game, which was too much even for the British standard of morals. In New Zealand and some of the Australian states Rosenthal might not only have continued taking bets on horse races, but have received a salary from the government for doing it, since racetrack gambling is one of the new functions which the progressive governments of those countries have assumed. In England Rosenthal could not have turned informer, because the newspapers supply the desired information as to where and how to bet. The bill which the Bishop of Hereford introduced into Parliament to prohibit the advertising of lotteries and other forms of gambling was withdrawn by him on July 11 because everybody said it was absurd and impossible. And so it was from a British point of view, tho in the United States such laws have long been enforced. The New York police are accused of protecting the bookmakers, instead of arresting them. The British police are not subject to this temptation, for the simple reason that it is a part of their official duties to protect bookmakers, instead of arresting them. Who would dare to interfere, as have American legislators, with "the sport of kings"? The worst charge that has been brought against New York is that the gamblers gave money to certain police officials in order that they might run secretly their illegal gaming tables. But last year the gamblers of France paid the Government 15 per cent. of their gross receipts, $1,441,000, in order that they might run openly their legal gaming tables. Those who live in glass houses should not call the kettle black.

Modernism in the Roman Breviary

In many ways has Pius X attempted to kill the hydra-headed monster of modernism. Accused of it, priests have missed the miter; doctors in divinity have been dismissed from seminaries; newspapers and magazines suppprest; church histories, approved by competent authority, put upon the Index; well-known Catholic scholars objects of suspicion; bishops and even cardinals suspected; in a word, modernism like a cancer corrodes Catholicism. Now it disturbs the Congregation of Rites, according to the Jesuit weekly *America.*

"The Congregation of Rites has sent a circular to all bishops and generals of religious orders and congregations, requesting each, in the name of the Sovereign Pontiff, to appoint a commission to examine into the historical lessons of the breviary for the special feasts of his diocese or order, comparing them with ancient codices, if these exist, or with approved tradition, and using all diligence to restore the true history, in case they should find existing lessons to have departed from it. The revised lessons are to be sent to the Congregation with the reasons of any addition, omission, or change that may have been made."

The Breviary legends received rough handling from Duchesne in his *"Liber Pontificum"* and *"Fastes Episopaux,"* from Houtin in his "Apostolic Origins of the French Church" and from the layman Dufourcq, a professor in the University of Bordeaux, who wrote up the Roman martyrology; likewise the priest who uses the non-de-plume Saintyves exposed the various legends of France. Perhaps, however, the new commission is intended merely to bolster up the immortal legends.

Progress in Missions

The annual statistics of Protestant foreign missions, as given by the *Missionary Review,* show real progress. The total communicants for 1911 of the American missionary societies is given as 876,299, as against 400,616 for 1900; while those for the British societies is 675,645, against 364,584 for 1900; and

of the German societies 272,082, against 157,480. When to these are added the remaining missions of the world we are given a present total of 2,304,318 communicants for 1911, against 1,370,545 for 1900, the number nearly doubling in eleven years. This increase corresponds very nearly with that given by the decennial censuses of India, where the percentage of increase is very much greater than that of population. The number of adherents is about double that of communicants, the total given being 4,875,454, and 1,477,049 scholars. The total home income of the American societies for 1911 was $12,290,005; of the British societies, $8,994,195; of the German, $2,076,884; of others, $1,936,030, which gives a total for Christendom of $25,297,074. That the converts are not all "vice Christians" may be gathered from the fact that their own contributions were $5,519,184. While these figures are encouraging, they give no occasion for pride, when compared with the amount paid in this country alone for intoxicants and tobacco.

Farm Work

One of the ablest of our contemporaries, commenting upon the rush of college boys to secure vacation work, while complimenting them for their readiness to do something, takes occasion to show the immense value of knowing one thing, or a few things, well, rather than a smattering of all sorts of stuff, that cannot be used. It tells us that, from its own observation, very few of the boys or the girls, now offering themselves for jobs, have anything definite that they can do. They are rather looking for something that can be easily done, and for large salaries. They do not even seem to be anxious to be particularly helpful, rather to get short hours and good wages; a good deal as in college they are trained to hunt for easy snaps in their selection of studies. A business man is quoted as saying: "I would rather have an applicant tell me that he can do one thing thoroly well." Then comes the question why more of these young folk are not looking for work in the country than in the cities. They are wanted on the farms, right bad, and right now. It is harvest time, and the work is healthy and the wages are good. Every young man and every young woman in the schools of the United States could find work on the farms for the next two months, immensely improving health, while toughening muscles; and go back with pockets full. The lecture is a good one, and it is timely, and withal we endorse it as the very key to success. Let our young folks do something, and do it well, and they will never be short of situations. Let them get out of the city as far as possible, and do good wholesome ozone work in the fields. They can feel at the same time that they are public benefactors as well as private reapers, for they are putting into the public granary bushels of wheat that are in danger of being wasted for lack of hands to harvest. We know of a good many college graduates that are in need of just the same lesson. They have crowded the professions, to the detriment of themselves and everybody else. There is nothing nobler under the sun than farm work.

Over 1,200 stenographers of various countries have petitioned the Holy See to have St. Gynesius of Arles proclaimed the patron saint of shorthand writers. Considering their need we trust this petition will not be granted without having first received assurance from St. Gynesius that he will accept the responsibility and perform its duties.

Henri Poincaré, a sketch of whose life and philosophy was published in our series of "Twelve Major Prophets of Today," October 5, 1911, died in Paris July 17. It is a great loss to France and the world that this brilliant mathematician, astronomer and philosopher should have been taken away in the hight of his powers at the age of fifty-eight.

First, to smash the Republican party as the Republican party did the Whigs.

Second, to out-Lloyd-George Lloyd-George as a radical.

Third, not to be elected this time, but four years hence.

These we surmise are the three cardinal expectations of Mr. Roosevelt.

Colonel Harvey is willing to make up, but not to kiss.

Insurance

Fraternal Insurance Rates

According to the distinguished Commissioner of Insurance of Colorado, Hon. W. L. Clayton, who has recently issued a special bulletin to fraternal insurance associations and their managers, "the laws of mortality are fixed by Divinity, and must be respected by mortals here below." There are those, perhaps, who will regard this unqualified assertion of the commissioner as dogmatic, while others will see in it an indulgence in theological science somewhat foreign to the jurisdiction of an insurance commissioner. It would be useless for these carpers to challenge the statement, however, and attempt to put it to the proof, for if the laws of mortality are not fixed by Divinity, how and by whom are they regulated? And if by locating all mortals "here below," we are bound to infer that the immortals are all above, what essential difference will that make? The commissioner is on rather solid ground in a subsequent assertion when he says that the laws of mortality "cannot be affected by resolutions of assemblies or acts of legislature." In a general sense this is true.

The precautions that organized society takes in the shape of laws against the spreading of disease; the maintenance of boards of health; the establishment of an elaborate scientific system of public hygiene and inspection; the efforts made to suppress adulterations in foodstuffs, medicines and beverages; the discoveries made by medical men in locating the causes of physical decay and disease, and in neutralizing them, have done something along the line of reducing the mortality believed to have been "fixed by Divinity." The claim made by statisticians that the improvements made during the past one hundred years have resulted in increasing the term of human longevity fifteen years, is probably well within the bounds of reason.

But all this is aside from the good general advice which Commissioner Clayton tenders to the fraternal societies and those interested in advancing their usefulness. He is trying to impress upon them the necessity for adequate premium-rates as the only reliable safeguard of the contracts they are making with their members. Rates must be made "to conform to those actuarially estimated to be scientifically and mathematically adequate," he correctly insists. That in some instances they have been scandalously inadequate, is notorious; and that others continue in that state, greatly to the peril of certificate holders, is beyond contradiction. It is fully conceded that the managers of all, or nearly all, American fraternal societies not only desire to place them on a sound actuarial basis, but that they are struggling to do so. Commissioner Clayton calls the attention of all to the provisions of the "Mobile Bill," formulated and recommended for adoption in all the States by the National Insurance Commissioners' Convention, at their meeting in Mobile in 1910, and commends them to their practice. "Fraternal insurance," he observes, in conclusion, "has served a noble purpose to humanity, and is deserving of recognition in the insurance world, . . . and we want to admonish this membership, not only to support, but urge upon your administrative officers the full and complete adjustment of your societies to the Mobile Bill."

An examination of the People's National Fire Insurance Company, of Philadelphia, recently completed by the insurance departments of New York, Massachusetts, Pennsylvania and North Carolina, shows its condition at May 31, 1912, as follows: Cash capital, $1,000,000; total assets, $1,955,923; unearned premiums and all other liabilities, except capital stock, $817,910; surplus as regards policyholders, which includes the capital, $1,138,013; net surplus, $138,013. As compared with the net surplus on December 31, 1910, the above figures show a loss of $158,060.

The bill abolishing the Louisiana fire insurance rating law, recently passed by the Legislature, has been approved by Governor Hall.

Financial

Fiscal Year's Foreign Trade

It is shown by the Government's report concerning our foreign commerce in the fiscal year that ended with June that both exports and imports largely exceeded those of any preceding year, the increase of exports over those of 1911 having been $155,000,000 and the increase of imports $125,000,000. The total, $3.857,-648,262, exceeded the former high record (that of 1911) by $281,000,000. If the trade with Hawaii and Porto Rico had been included, the total would have been about $4,000,000,000. The following table shows the exports, imports and excess of exports, beginning with 1896, the last year in which exports were less than $1,000,000,000:

Year.	Exports.	Imports.	Excess of Exports.
1912 ..	$2,204,222,088	$1,653,426,174	$550,795,914
1911 ..	2,048,691,392	1,527,985,088	520,706,304
1910 ..	1,744,984,720	1,556,943,430	188,037,290
1909 ..	1,600,011,104	1,311,920,224	351,090,880
1908 ..	1,860,773,346	1,194,341,792	666,431,554
1907 ..	1,880,851,078	1,434,421,425	446,429,653
1906 ..	1,743,864,500	1,226,562,446	517,308,054
1905 ..	1,518,561,666	1,117,513,071	401,048,595
1904 ..	1,400,827,271	991,087,371	469,739,900
1903 ..	1,420,141,679	1,025,719,237	394,422,422
1902 ..	1,381,719,401	903,320,948	478,398 453
1901 ..	1,487,764,991	823,172,165	664,592,826
1900 ..	1,394,483,982	849,941,184	544,541,898
1899 ..	1,227,023,302	697,148,489	529,874,813
1898 ..	1,231,482,330	616,049,654	615,432,676
1897 ..	1,056,993,356	764,730,412	296,263,144
1896 ..	882,606,938	779,724,674	102,882,264

Agricultural exports, in the year just ended, were almost the same in value as those of 1911, each total slightly exceeding $944,000,000. In the last ten years breadstuffs have declined from $267,500,-000 to $110,500,000, while cotton has risen from $313,000,000 to $565,000,000. As agricultural exports remained the same, the year's gain, of course, was mainly in exports of manufactured goods. Imports free of duty were $881,743,144, or 53¼ per cent. of all the imports. Exports of gold exceeded imports by $8,-369,848, and exports of silver were larger than imports by $17,840,196.

....Reports from Chicago say that the prices of shoes of all grades are soon to be increased by about 20 per cent., owing to the high cost of leather.

Cotton Futures

The Beall bill, passed in the House last week by a vote of 95 to 25, prohibits all dealing in cotton "futures," as they are called, or all exchange contracts for the purchase or sale or cotton in months following the date of the transaction. The penalties are severe, being fines or imprisonment or both. This legislation is aimed at "gambling," and many who support it believe it is in the interest of the cotton planter. We are not convinced that the planter would gain by such a law, which, by its effect upon cotton exchanges, would tend to narrow his ready market and to prevent a kind of trading which, in the long run, exerts a steadying influence upon prices. Such legislation would injuriously affect manufacturers, who have become accustomed to "hedge" against, or to fortify, their transactions in the market for immediate delivery by purchases or sales of futures. The advocates of the measure should seek to ascertain whether they cannot prevent harmful speculation or gambling without interfering with what may fairly be called legitimate methods of business.

....In the year ending with March Canada paid bounties on manufactures as follows: Manila binder twine, $50,556; wire rods, $166,750; lead, $178,288; petroleum, $141,935.

....The Empire Trust Company, of which Le Roy W. Baldwin is president, and Myron J. Brown is secretary, proposes to increase its capital stock from $1,000,000 to $1,500,000. The total resources of this company now amount to $21,660,883.

....British consols made a new low record on the 19th, selling at 74. This is the lowest price since 1826, and the consols were then 3 per cents. Now, the rate is 2½ per cent. In the course of a long article the editor of the London Statist, a strong financial journal, says "the main cause is the universal belief at home and abroad that war is inevitable between this country and Germany."

The Independent

VOL. LXXII NEW YORK, THURSDAY, AUGUST 1, 1912 No. 3322

Survey of the World

National Politics

Governor Wilson was preparing his letter of acceptance last week, and Mr. Roosevelt was writing the long speech which he is to deliver at his third party convention. Ex-Senator Beveridge, of Indiana, who has formally severed his connection with the Republican party, will be the temporary chairman of that convention. Governor Deneen, of Illinois, replying to a committee of Roosevelt men, said that Mr. Taft, the regular nominee of the Republican party, would have his support. Therefore a Roosevelt State ticket will be put up in that State, where the Governor has been nominated at the primaries for re-election. Senator La Follette will remain in the old party, which, he says, "has a clear Progressive majority in its ranks." Mr. Roosevelt's course, he adds, "has destroyed all hope of a Progressive Republican victory in the Presidential contest." A majority of the Progressive Republicans in Congress, it is asserted, express disapproval of the movement for a new party. Senator Works will follow neither Roosevelt nor Taft. As a Progressive he says he could consistently vote for Governor Wilson. The Governor publishes extracts (withholding signatures) from many letters, in which Republicans say they intend to vote for him. F. W. Bird, appraiser at the port of New York, has resigned to join the Roosevelt party. Joseph E. Thompson, collector of internal revenue at Birmingham, Ala., known as an active supporter of Roosevelt, has been removed from office. William P. Luck, collector at New Orleans, a Roosevelt man, has resigned to go into business. On the other hand, E. W. Sims, of Chicago, secretary of the third party's national provisional committee, has resigned, owing to his disapproval of the movement for a Roosevelt State ticket in Illinois, and Wallace Bachelder, head of the Progressive party in Vermont, will not support Mr. Roosevelt. In reply to his telegram of inquiry, Mr. Roosevelt said: "We cannot endorse any candidates of either party who will not support Roosevelt electors in the coming election." He responded as follows:

> "I supposed that I was fighting for the real rule of the people and against bosses and bossism. Your telegram makes it plain that you direct me and men in every State that we must not vote for any candidate for office, no matter how honest, able, efficient and progressive he may be, unless that candidate will agree to pay for our votes by supporting Theodore Roosevelt for President of the United States again, by supporting Roosevelt electors. I was a member of your regiment in 1898. For fourteen years I have felt more affection for you than for any other person on earth except the members of my own immediate family. It is a terrible wrench, Colonel, but I cannot fool myself and I must be straightforward and frank with you as you know I always have been. With grief the depth of which you cannot know I have decided, after one of the hardest fights I have ever been forced to put up, that I cannot longer support you for President of the United States."

Judge Dillon, recently nominated for Governor by the Republicans of Ohio, has withdrawn from the ticket, owing to the determination of Mr. Roosevelt's friends to set up third party candidates in that State. Mr. Roosevelt says he is confident that in at least six States his supporters will control the organization thruout the campaign. These are Kansas, Minnesota, South Dakota, Idaho, California and Washington. In Minnesota seven of the electors refuse to serve

as Taft electors; five of them have resigned and will run as Roosevelt electors. In the House, last week, Mr. Mondell, of Wyoming, defended the nomination of Mr. Taft, examining the claims as to contested delegates. Mr. Norris, of Nebraska, replied in the interest of Mr. Roosevelt. From the White House there has been given out for publication an elaborate statement, prepared by Mr. Hilles, concerning the contest decisions. Mr. Roosevelt permits it to be known that in his address at Chicago he will advocate a statutory minimum wage for women.

Tariff and Trust Bills

In the Senate, last week, action was taken upon several tariff bills. By a vote of 34 to 20, the proposed annual appropriation of $225,000 for the Tariff Board was approved. All the Democrats, three excepted, were counted in the negative. This appropriation the Democratic majority in the House has rejected. The Senate adopted an amendment requiring the Board to submit an annual report to Congress. On the 25th, Mr. Penrose, from the Finance Committee, proposed a substitute for the House Wool Bill. This substitute, which is said to have been approved by the President, was passed in committee of the whole, 34 to 32, the Insurgents supporting it. Unexpectedly, however, Mr. La Follette moved as an amendment his bill, which was passed last year and (after having been modified in conference) vetoed by the President. It was accepted, 39 to 27, and passed, 40 to 26, the majority being composed of the Democrats and 10 Republican Insurgents. It makes the duties 35 per cent. on raw wool and from 40 to 55 per cent. on manufactures. Mr. Underwood, the Democratic leader in the House, says there will be an agreement in conference and that a bill will be sent to Mr. Taft. On the following day the so-called Excise bill passed by the House, extending the provisions of the present corporation tax law to individuals, firms and copartnerships, the tax being 1 per cent. on net incomes exceeding $5,000, was passed in the Senate, 37 to 18, by a combination of Democrats and Insurgents, with amendments designed to include idle holders of stocks and bonds, and excluding labor, agricultural, benevolent, fraternal and building loan associations. Mr. Cummins's bill for a permanent tariff commission was attached, 38 to 29, and also a provision, which the House will reject, repealing the Canadian reciprocity act. On the 27th, the Republicans, united, passed a substitute for the House Sugar bill. This, proposed by Mr. Lodge and amended by Mr. Bristow, was carried by a vote of 37 to 25. It eliminates the differential and reduces the main duties on raw and refined sugar by about 16 per cent.——The reports of the Stanley Steel Trust committee were not submitted to the House, but the bills to be recommended were published. There will be five reports, the first by all of the majority members except Mr. Littleton; the second by Mr. Littleton, who dissents; the third by two minority members, and the fourth and fifth by the two remaining members of the minority. Mr. Littleton objects to the bill placing upon an accused corporation the burden of proving its innocence. He also prefers Federal control and regulation to enforcement of a law which (as proposed by the majority) would make control of 30 per cent. of an industry presumptive evidence of unlawful restraint of trade. The minority members favor Federal control and regulation, but disagree about empowering the Government to fix maximum prices. Action upon the proposed bills at this session is not expected. Mr. Littleton thinks a commission should be appointed to inquire and report what the Government's policy with respect to combinations should be.

Other Topics in Congress

Owing to a deadlock of the Senate and House concerning the proposed construction of two battleships, the House Democrats, on the 24th, held a caucus, at which a motion to authorize the building of only one ship was lost, 62 to 70. There is a revolt against this decision, and it is said that at least thirty-five will not obey it. Mr. Sulzer, chairman of the Foreign Affairs Committee, is one of these. He is circulating a petition for another caucus and says he ex-

pects to see the vote reversed. Mr. Underwood would have at least one ship, and it is reported that Governor Wilson is in agreement with him.——Favorable reports have been ordered in the Senate on the House bill for a Department of Labor and the bill for the appointment of a Commission on Industrial Relations to inquire concerning the condition of labor in the principal industries, agriculture included.——Federal District Judge Cornelius H. Hanford, of Seattle, resigned by telegraph on the 22d, while the special Congressional committee investigating charges as to his alleged misconduct were examining witnesses. In a brief statement he said he would return to the practice of law and was glad his record was what it was. The committee returned to Washington, and it is expected that the proceedings for impeachment will be discontinued.——Representative Berger, whose resolution caused the inquiry, is willing that it shall now be ended. He regards the resignation as an admission of guilt.

Municipal Corruption

Eight Detroit aldermen and the secretary of the council committees were arrested last week for accepting bribes. They had been trapped by William J. Burns. The most prominent is Thomas Glinnan, president of the council and a candidate for mayor. Secretary E. R. Schreiter is also secretary of the American League of Municipalities. The Wabash Railroad Companuy asked, last winter, that part of a street be vacated, to make room for freight warehouses. The council opposed the application and delayed action. Suspecting that bribes were sought, Mayor William B. Thompson, with the help of a wealthy citizen, engaged the services of Burns. The latter sent to the city a detective, who professed to represent the railroad's interests. He was approached by Schreiter with a corrupt proposition, and negotiations with several aldermen followed. The application was granted, opponents suddenly becoming friends. When they came to the detective's office for the bribe money, it was handed to them and they were confronted with the evidence of a dictagraph, which had recorded their conversations with him. Arrests were made, and six more aldermen are implicated. It is said that Glinnan made full confession.

The Islands

Several additional cases of bubonic plague in Porto Rico were reported last week. There have been 42 cases in all, and 26 deaths. The inspectors are examining about 500 rats each day, and thus far 2½ per cent. of these have been found to be carrying infected fleas. There was one new case in Havana last week. A conference of health officers from leading Southern cities has been held in New Orleans, where plans for excluding the disease were considered. ——Suppression of the rebellion in Cuba has been followed by sharp political discussion, relating partly to reports that General Monteagudo and other officers of the army were conspiring to force a re-election of President Gomez. Some of the newspapers are protesting against our Government's interference with Cuban affairs. —— Unofficial reports assert that the revolt in Santo Domingo is seriously embarrassing the Government. Washington Lithgow, an American citizen, was about to be expelled from the country last week, for sending dispatches in which, it was alleged, the revolt was exaggerated. Our Minister interfered in his behalf, and he was allowed to remain.

Mexico

Orozco's men were still moving westward toward or into Sonora last week and were meeting no opposition. Guerrilla bands of rebels were destroying railroad lines, and they even crippled the road connecting Huerta with his base of supplies, by burning seventeen bridges. Americans fled from Madera to El Paso, having been robbed and abused by Orozco's soldiers. Our Minister, reporting to Washington, said that the cattle industry had been ruined, that American colonies were suffering from raids, and that the Government troops were unable to cope with the numerous guerrilla bands, many of which had no relation to Orozco. In the south, owing to the Zapatists' attacks upon railway trains, the constitutional guarantees were suspended, and also in Chihuahua and Sonora. Whereupon the

rebels promised to retaliate and to kill every Federal soldier they should capture. Our Government arrested Victor Ochoa, who rebelled against Diaz years ago and was confined in an American prison two years for violating the neutrality laws. He has been breaking these laws again, by smuggling arms and ammunition across the boundary. With Emiliano Vasquez Gomez (recently arrested) were found 20,000 copies of a proclamation. These were to be distributed in Texas. They promised the seizure of great tracts of land, which would be given soldiers supporting the rebel cause. Earthquakes have almost depopulated the city of Guadalajara. There were ninety shocks last week. Almost every building in the town was injured, and the cathedral, more than a hundred years old, was split in two. The people regard with veneration one Cesario Gracia, who predicted the shocks and who now prophesies that the city will sink in a lake of fire and brimstone.——In the Senate at Washington last week, Mr. Fall, of New Mexico, bitterly attacked the State Department, saying it had failed to obtain from Mexico redress for the killing of Americans and the destruction of their property, while Germany and China had collected damage claims. There will be an inquiry under the Nelson resolution to ascertain whether the revolt in Mexico has been fomented by American interests. Officers of the Standard and Pearson oil companies will be questioned.

South America

In addition to the commission appointed some time ago, the Peruvian Government has sent to the Putumayo rubber district Dr. Romulo Paredes to make further investigation. He was there last year and ordered the arrest of several men. Peru insists that the offenses pointed out in Sir Roger Casement's report were committed some years ago, asserts that recently there have been very few such crimes, and says that when they have occurred the guilty have been punished, as a rule, altho several fled to other countries, from which Peru has sought to bring them back by extradition proceedings. The agent of our Government, Mr. Fuller, will start from Iquitos for the rubber district this week. An English petition, addressed to the Premier and signed by prominent persons, urges the British Government, acting with the United States, to end slavery in the rubber district, and says that the Monroe Doctrine has involved the United States in grave responsibility for the crimes in Putumayo. It admits, however, that the crimes were committed in the interest of an English company, whose rubber was marketed in London. The British Government has decided to aid the establishment of Catholic missions in Putumayo, as other missions would be excluded by Peru's laws or policy. There will be a popular subscription for the support of these missions.——The Argentine Chamber of Deputies, last week, adopted a resolution asking the Minister of Agriculture to say what he thought about the interference of the American Beef Trust in the Argentine cattle and beef trade, how he proposed to meet the danger threatening cattle breeders and the people, and how far the interference had already gone. Recently, at a mass meeting in Buenos Ayres, speakers protested against the attempt of the Trust to obtain control of the country's beef trade.——Severe earthquakes in Peru have caused loss of property and life in Piura and a panic in Guayaquil.——Current reports say that Cipriano Castro is planning an attack upon Venezuela's Government and has sent $1,000,000 to his followers in Trinidad and Columbia. Venezuela is negotiating for the purchase, from our Government, of the small steel warship "Isla de Cuba," captured from Spain in the war of fourteen years ago.——In the Students' Congress, in Lima, last week, at the old University of San Marco (founded in 1553), an address was made by a delegate from California.——Honduras has been the only country in the Western Hemisphere to which a fugitive, fleeing from justice in the United States, could go without fear of extradition. But a treaty of extradition with Honduras was signed a few days ago at Washington.——Argentina's Commissioner of Immigration recommends that Hindoo immigrants be excluded. There are many destitute Hindoos in that country.——Dr. Zanetti, an instructor in chemistry at Columbia Uni-

versity, New York, goes to Uruguay, where he will be the head of the new Institute of Industrial Chemistry. Dr. Lamme, also an instructor at Columbia, is to take charge of Uruguay's geological survey.

London Dock Strike Ended The strike of the London dockers, which has lasted ten weeks and caused great suffering among the poor and injury to commerce, was brought to an end on July 27 by the surrender of the strikers. The strike arose by chance over a trivial dispute about the union card of one of the watchmen, and was not regarded with favor by the labor leaders, tho they recognized the justice of the revolt against low wages and hard conditions of employment. The demands of the men as formulated by the Transport Workers' Federation called for 29 cents an hour for dockers, lightermen and stevedores, overtime at the rate of 38 cents an hour, time off for meals, a ten-hour day and recognition of the union. The National Sailors' and Firemen's Union resisted the efforts of the International Seamen's Union to organize a national strike in their support. The number of men involved at one time reached 100,000, and their families were in many cases brought to absolute destitution, some even to actual starvation. School children in schools were given two meals a day there. Union and charitable funds were soon exhausted. Strike-breakers and men who returned to work were often attacked, but there was no systematic mob violence, and the police were generally able to keep tolerable order, tho but little could be done in the way of unloading ships even when needed to keep up the food supply of London. The chairman of the board known as the Port of London Authority was Lord Devonport, who steadfastly refused to make any concession whatever to the strikers. When the clergy and public-spirited citizens remonstrated with him and called attention to the sickness and starvation resulting from his course, he replied that any who would could go to work at any time, and that to yield was to encourage violence and mob rule. On account of this obstinate attitude the fury of the strikers was turned against him as they saw they were losing the fight. Ben Tillett, leader of the strike, in addressing a vast crowd on Tower Hill, denounced Lord Devonport as a murderer of women and children and said such vermin were not fit to live. He would not ask them, he said, to avenge their own wrongs, but to call upon God to strike him dead. Thousands of men then held up their hands to heaven and joined in one great shout, "Oh, God! strike Lord Devonport dead!" At the same meeting Lord Devonport was called "the worst criminal on earth" by James O'Grady, a member of Parliament, who the day before had walked out of the House of Commons swearing at the Government for not taking up the strike question. But the action of Tillett was afterward formally repudiated and condemned in the name of the Labor party by William Crooks in the House of Commons. Chancellor of the Exchequer Lloyd-George stated that it would be a mistake to deal with the dock strike as an isolated affair, but the time had come to consider the whole problem, and the Government proposed to deal with it by some form of legislation in the near future.——Some 30,000 of the strikers have repudiated the action of the leaders and refuse to go back to work. At a mass meeting of the dockers, held last Sunday, the members of the strike committee were furiously denounced because of their surrender, and the meeting resolved to continue the strike. Ben Tillett promised a national labor strike in their support.

The War of Dreadnoughts Preparatory to beginning the secret maneuvers in the North Sea, the British fleet assembled at Portsmouth and was inspected by both Houses of Parliament and large crowds of people. The fleet comprised 230 warships of all classes, manned by 80,000 men. During the evolutions aeroplanes joined with submarines in an attack upon the battleships, some being launched from the decks of vessels, others rising from the sea or starting from hangars on the land and dropping dummy bombs upon the decks of the Dreadnoughts. The Canadian Premier, Robert L. Borden, is in London in consultation with the Imperial Government, and it is expected that a result of the conference will be an annual

contribution of $7,500,000 or more from Canada for the support of the British navy. It will be remembered that his predecessor, Sir Wilfrid Laurier, advocated the creation of a Canadian navy which should be absolutely under the control of the Dominion even at times when Great Britain was involved at war with a foreign power.——Winston Churchill, First Lord of the Admiralty, in asking the House of Commons for a supplementary appropriation of $5,000,000, was unusually plain-spoken in his references to Germany as the direct cause of the increase in expenditure. He stated that the effect of the new German naval law would be that four-fifths of the entire German navy would be maintained in full and permanent commission and instantly ready for war. "Such preparation is remarkable," he said, "and as far as I am aware finds no example in the previous practice of modern naval powers." Under the new law the ultimate strength of the German fleet would be forty-one battleships, twenty large armored cruisers, forty small cruisers, and smaller craft in proportion.

"That will be an extremely formidable fleet, and the only way to meet it is by cool, steady and methodical preparation prolonged over successive years. There is no use flinging money about on the impulse of the moment. The strain which Great Britain will have to bear will be long and slow, and no relief can be gained by impulsive or erratic action. We should learn from our German neighbors the way of the policy which marches unswervingly to its goal.

"The supplementary estimate to meet the extra German expenditure is only a small instalment, and the new ship-building program of the next five years will be raised to five vessels next year and four boats each year thereafter instead of three in 1913, four in 1914, three in 1915, four in 1916 and three in 1917, the number I had hoped we might stand at."

The First Lord of the Admiralty pointed out that the increased fighting power of the German fleet involved the reorganization of the British forces in order that a necessary margin of safety might be maintained. He then announced that he intended to raise the number of battleships in full commission from twenty-eight to thirty-three by 1914. From 1914 onward Great Britain will have five battleship squadrons, composed of forty-one ships, and of the five squadrons four will be in full commission. Thus Great Britain will have thirty-three battleships against Germany's twenty-nine. This might not be considered a very satisfactory proportion, Mr. Churchill declared, but having in regard the character of the different vessels the Admiralty was of the opinion that thirty-three battleships would be inadequate for the needs of 1914-1915. Any attempt to confine British naval supremacy to any particular waters would be not only false strategy, but bad policy. Six old battleships would be withdrawn from Malta and replaced by four battle cruisers of the "Invincible" type, and the four battleships at Gibraltar would be increased to eight. Referring to the new Austrian navy now being built for the Mediterranean, Mr. Churchill said that it did not seem to him that two Powers "whose past history was not altogether free from differences were likely to combine in attacking Great Britain," and he thought it unnecessary to maintain local superiority over their combined fleets.

British Politics

The Government came within three votes of being voted down one night last week, for when Lloyd-George called for a date to be fixt for the discussion of the naval appropriation the Liberal whips were able to round up only 136 members to 133 of the Opposition.——The Liberals and Laborites are in conflict over the question of running candidates from both parties in the same district. When the vacancies in Hanley and Crewe occurred the Laborites insisted that the Liberals should not contest these seats, but the Liberal leaders refused to comply. The result was that in Hanley the Liberal candidate was elected by a small plurality, but in Crewe the Labor candidate polled a sufficient number of votes to give the seat to the Unionist.——The British Medical Association has definitely decided to reject the terms offered by the Government for the treatment of workingmen insured under the new act. The Chancellor of the Exchequer offered the physicians 6 shillings ($1.44) per annum for all necessary medical attendance for each insured person, but they demanded half a guinea ($2.50), tho finally agreeing to accept $2.04. The association asks each member to pay a minimal subscription of $100 for the purpose of reimbursing

those practitioners who may suffer financial loss by their refusal to accept the Government compensation. About nine-tenths of the doctors of Great Britain have agreed to stand out against the law, so it is a question how Lloyd-George is going to get his medical service. Sir James Barr, president of the association, in an address described the insurance act as "the most gigantic fraud which was ever perpetrated on a confiding public since the days of the South Sea Bubble. Both were largely engineered by members of Parliament."——A big Unionist rally was held in Blenheim Palace July 27, presided over by the Duke of Marlborough and addrest by Bonar Law, Sir Edward Carson and F. E. Smith. Three thousand delegates from Unionist clubs and 20,000 members of the party were gathered in the big courtyard to listen to the speeches. Mr. Law said that the passage of the Home Rule bill "would light the fires of a civil war which would shatter the empire to its foundations." ——Dr. Ethel Smyth, the suffraget and composer of operas, who was arrested on the charge of being concerned in the attempt to burn Nuneham Park, the residence of the Colonial Secretary, Lewis Harcourt, has been released, since she easily proved an alibi. She will bring suit for false arrest.

The Embarrassments of Turkey

The struggle for supremacy between the Military League, representing the army, and the Committee of Union and Progress, which engineered the revolution, has reached an acute stage, and it is feared that civil war may break out at any time. The Government, realizing that it could not remain in power without the support of the army that put it there, has been yielding reluctantly to the demands of the Military League, but as these demands become more and more ambitious a conflict seems inevitable. The dismissal of Shefket Pasha from the post of Minister of War, in accordance with their wishes, did not satisfy the army men, and the next thing was an ultimatum demanding the resignation of Said Pasha as Grand Vizier within ten days under threat that in case of refusal the army would again march to Constantinople and overthrow the Government of the Young Turks just as it did that of Abdul Hamid four years ago. Late at night on the eighth day Said Pasha went to the palace of the Sultan and handed in the resignation of the Cabinet. The Grand Vizierate was first offered to Tewfik Pasha, Ambassador at London, but he made the immediate dissolution of the Chamber a condition of acceptance, so Muhktar Pasha took the post. Altho the new ministry is composed of able and honored men, it is doubtful if it can stand. The Military League prefers Kiamil Pasha and sent an ultimatum to the president of the chamber July 25 insisting upon the dissolution of that body within forty-eight hours. It is said that army leaders are determined to force the resignation of the Sultan in favor of his son, who is less favorably inclined toward the Young Turks. The new Government, while refusing to submit entirely to the dictation of the Military League, is trying to remedy some of the abuses of the Young Turk regime. The city of Constantinople is relieved of martial law, under which it has been ever since its capture by the revolutionists. The commandant of the metropolitan district and the commissioner of police have been removed. The Government promises the repeal of the laws interfering with public meetings and the press. The complaint has frequently been heard that there is less freedom of speech under the new regime than under the old. All of the Liberal papers in Constantinople have been suppress, so that the opposition has no way of appearing in print except in the Young Turk organ *Tanin*, which has offered the courtesy of its columns to its political antagonists. In many parts of the country no candidate stood any chance in the recent election unless he was on the slate of the Committee, and the Government interfered in various ingenious ways with the efforts of the opposition to hold meetings and reach the people. The promises made year year to induce the Albanian insurgents to lay down their arms have not been faithfully kept and this has contributed to the present revolt, which, however, centers in the province of Kossovo rather than Scutari. The Albanians are reported to have routed the Turkish garrisons at Pristina and Prisrena, and to have occupied these cities.

ZAPATA'S BANDITS

Mexican Bandits at Close View

BY EDWIN EMERSON

[Mr. Emerson was a member of the Rough Riders in the Spanish-American War, took part in the Colombian-Venezuelan War in 1901 as Venezuelan Colonel of Volunteers, and was decorated by President Castro with the Order of Bolivar for gallantry in action. He was also war correspondent in Manchuria during the Russo-Japanese War, and has written much on military affairs. This article, which comes to us direct from Mexico, is especially timely as only last week the Zapatistas actually murdered a trainload of eighty-four men, women and children—the most atrocious crime they have yet committed.—EDITOR.]

ONCE more, robbery and brigandage are rampant all over Mexico. In all the outlying regions the evil has become so universal that nobody dares to travel in the open country, unless escorted or armed.

This is really an old story in Mexico. It went out of fashion for a short time only during the latter part of the iron rule of Diaz.

A detailed history of Mexico's most famous bandits, from the days of Cortes down to the present time, would fill more than a five-foot shelf of dime novels. Long ago, under the rule of the Spanish viceroys in Mexico, there were instances of exalted Castilian noblemen who reverted to the customs of their medieval ancestors by taking to the road as robber knights.

Madame Calderon de la Barca, in her entertaining letters from Mexico, penned in the days of Bustamante and Santa Ana, while writing of the bandit evil

flourishing during her stay in the country, tells of a President's aide-de-camp, who profited by his inside official knowledge to waylay travelers that had applied at the palace for military escorts.

A little later, another bandit chief, Lozada of Tepic, called "The Tiger of Chapala," carried on his depredations on so high a scale that his band of robbers grew to an army of many thousand Indian followers, with whom he was able to defy the governments of Benito Juarez and Porfirio Diaz for nearly a score of years. He was subdued finally in a series of pitched battles after a regular military campaign led by Ramón Corona, the ablest of Diaz's generals. When Lozada was shot on the plaza of Tepic he left with his English bankers a private fortune aggregating two million dollars in Mexican silver.

Within the last few years, in that same district of Tepic, the main highway running from Tepic to San Blas, on the Pacific coast, has been made unsafe by another highwayman known as *El Chivo* —"the Goat." He, too, was finally run down and killed by Diaz's soldiers.

After his death brigandage in the Territory of Tepic was stamped out by Diaz's iron decree that all men found with arms without due license in that Territory should be shot without trial. After some twenty or thirty men had fallen victims to this decree, the roads of Tepic became as safe as the streets of the capital.

With the collapse of Diaz's rule last year came the immediate return of highway robbery and brigandage all over the country. For a while the bandits practised their robberies under the pretense of being honorable revolutionists; but after the triumph of the Madero revolution, when no such excuse was left, they threw off the mask and became brigands pure and simple.

Now that Pascual Orozco has taken to the warpath again in Chihuahua, and his cause has been espoused by Emiliano Zapata, the greatest bandit leader of the south, the other brigands all over the country are once more calling themselves *Orozquistas* or *Zapatistas*, as the spirit may move them.

Outside of Chihuahua the bandits rather prefer to call themselves *Zapatistas*, knowing that all decent folk dread the name of Zapata far worse than that of Orozco.

Just what the name of Zapata stands for in his own country may be judged from the fact that the Mexican newspapers like to call him "the Attila of Mexico." A "very Mexican Attila," one feels tempted to say.

It is no exaggeration, however, to say that latter-day brigandage in Mexico can be studied at its highest flower in the picturesque careers of Emiliano Zapata and of his younger brother Eufemio.

Some twenty years ago both brothers, barely come of age, in the State of Morelos, in the central region of Mexico, were young *rancheros*, the equivalent of country squires in England. After the manner of Mexican *rancheros* they were bred to be good horsemen, good lasso throwers, good shots and otherwise skilled in such Mexican country sports as roping horses and cattle, "tailing" bulls and being "quick on the trigger." After the manner of Mexican country squires, likewise, they were given to such sports as gambling, cockfighting, betting on horse races, going to bullfights and trying to break the hearts of *las señoritas*.

One day, at Yautepec, in Morelos, Don Emiliano Zapata, in the heat of an argument at a cockfight over a lady shot and killed the man who had quarreled with him. Without delay he picked out his best horse from his father's ranch and took to the open country. Two weeks later, when he was imprudent enough to ride into town to attend a *fiesta*, he was arrested, and, having been duly convicted, was reprieved from jail into service in the regular army.

He served fifteen years, during which time he was promoted to the rank of first sergeant. Having grown rather too old for regular army service, he was dismissed from the ranks in the early spring of 1911. Barely a month after his discharge the Madero revolution was in full swing.

Emiliano Zapata, having returned to his ancestral ranch, his father having died in the meanwhile, busily went to work to get his revenge on Porfirio Diaz. He and his brother Eufemio, who had likewise fallen out with the author-

EMILIANO ZAPATA
Leader of the Mexican bandits

ities of Yautepec, spent all their available cash in buying arms and cartridges and otherwise in equipping themselves to take a hand in Madero's revolution, should it spread southward. At the same time they enlisted in their cause all the men of their own ranch, as well as all other dissatisfied spirits from neighboring ranches and haciendas in Morelos.

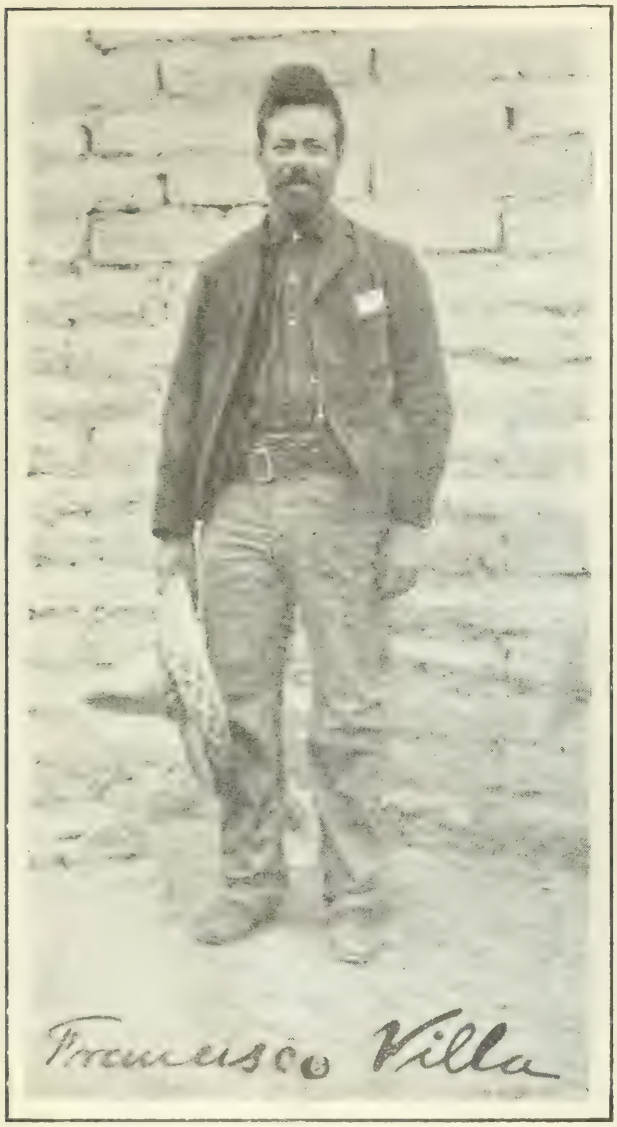
So soon as the news of Madero's first decisive victory in the north reached Morelos, Don Emiliano and his brother Eufemio, with some 200 followers, took the warpath. They were joined by all the outlaws still at large in Morelos.

Emiliano Zapata's first act was to ride with his armed band into Yautepec, a fairly large-sized town east of the ancient capital of Morelos, Cuernavaca. It was the place where Emiliano Zapata was first put under arrest, the time that he was drafted into the army as a conscript. After riding up to the town hall and reminding the mayor of the unpleasantness that had befallen him in Yautepec, Emiliano Zapata shot down the mayor in his office. After this the two Zapata brothers gave orders to their followers to loot and pillage the town to their heart's content. Poor Yautepec has not yet recovered from the ravages of this visitation.

After this the two Zapata brothers, with their growing horde of outlaws, rode cross-country to Cuautla, in Morelos, southeast of Yautepec, and sacked that town, robbing all ranches along the way. After this they rode with their followers, now numbering some five hundred horsemen, over to Ayala, south of Cuautla, where ruled a transferred *jefe politico,* whom Emiliano Zapata held to be responsible for his old-time arrest and conviction. Having taken the town of Ayala by surprise, and having cap-

EUFEMIO ZAPATA
Brother of the bandit leader

tured the *jefe politico,* the Zapata brothers amused themselves on the following day by giving a bullfight in the bull-ring of the town. The chief attraction of this was the *jefe politico,* lashed to a stake in the center of the bull-ring. After the first bull had gored the unfortunate *jefe politico* almost beyond recognition, Emiliano Zapata and his brother put an end to this bloody sport by shooting both the *jefe politico* and the blood-crazed bull.



After this they and their followers, now numbering more than 800, rode due south and stormed the prosperous town of Jojutla, in Morelos, which was promptly sacked. All the ranches and haciendas in the neighborhood were either sacked outright or had to pay ransom.

By this time a federal column was moving down upon the outlaw band from Cuernavaca, the capital of the State. Evading this column, the Zapata brothers appeared in the rear of the soldiers close to Cuernavaca. The first indication of their presence near Cuernavaca was given at Tres Marias by the hold-up of a railway train from Mexico City, when Professor Olssen-Seffer, of the University of California, with some other passengers, were killed by the bandits.

This was during the last days of the Diaz government. Old General Diaz pulled himself up sufficiently to send an expedition of infantry, cavalry and artillery under General Huerta into Morelos. But within a week General Huerta was recalled to Mexico City with all his men.

After this the city of Cuernavaca was at the mercy of the bandits. All foreigners, as well as those who had reasons to fear Zapata's wrath, fled the town.

Cuernavaca was saved from assault on the part of the Zapatas by the sud-

The ex-bandit, now in command of the Federal forces in Northern Mexico.

den triumph of Madero's cause, followed by General Diaz's incontinent abdication and flight from Mexico. After this the whole country was turned over to the Maderistas. Zapata and his hordes rode into the town unopposed.

For a week or more Cuernavaca fell under a reign of terror. The municipal treasury was looted, private houses were sacked, all hotels and public inns were invaded by Zapata's followers, and every horse, mule or burro within 20 miles of the town was commandeered by the Zapatistas. Among other diversions the Zapatistas amused themselves by invading a Protestant Episcopal chapel and using it for a dance hall.

Luckily for Cuernavaca the revolution had reached its high water mark just about that time, and Francisco Madero, the victor, appeared upon the scene.

I was there when Señor Madero, accompanied by rebel chieftains from the north, reviewed Zapata's so-called "army of the south."

After a noisy banquet in the pavilion of the ancient Borda gardens, a place where Empress Carlotta used to feed the swans, the old town of Cuernavaca was treated to a great mounted parade of all the Zapata hordes.

Some 7,000 bandit horsemen, all told, rode past the old Spanish palace, reared by Cortez, from the balcony of which Señor Madero reviewed them, standing side by side with young Giuseppe Garibaldi, his chief of staff.

Here, among all those wild horsemen clattering past the palace, was to be seen every variety of arms and accoutrements. Some were armed to the teeth, with rifle, saber, pistol, poniard and double cartridge belts strung over both shoulders, as well as around the saddle horn or back of the saddle cantle. Others again carried nothing but a small pistol, with no cartridges in sight or only a rusty cane knife. Those who bore guns held them at salute while galloping past the old Cortez palace.

There were to be seen modern magazine rifles, double-barreled shotguns, and old army muskets with bayonets. I even caught a glimpse of some ancient smooth-bore Kentucky flintlocks, with rusty barrels, seven or eight feet long, preserved apparently since the days of Colonel Bowie, Davie Crockett and the Alamo.

Those of the bandits who rejoiced in side arms showed no less catholic a taste. While the majority had to be contented with *machetes* or cane knives, there were some among the leaders who flourished huge cavalry sabers, cutlasses, rapiers, long straight Spanish swords, or Toledo blades with basket hilts dating apparently from the early days of Cortez and Alvarado.

As for the riders—every man was as differently equipped in apparel and horsegear as he was in arms.

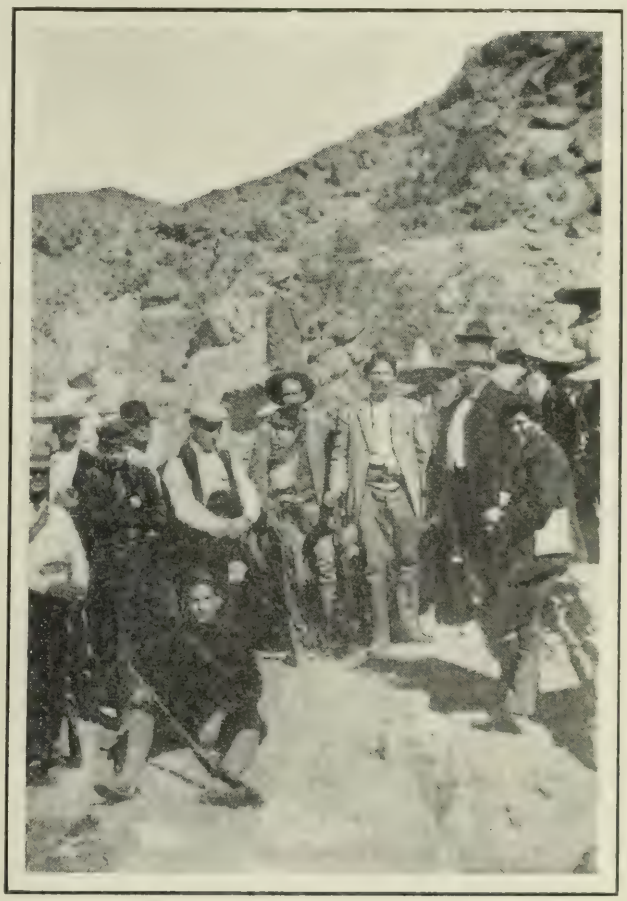
There were to be seen all kinds of huge *sombreros*—white, black, blood red, silver embroidered, of fine *jipijapa* weave or of common straw braid, with their wide brims tilted every which way, or ornamented with fancy decorations such

as gaudy scarves, little flags, ink embroidered inscriptions, amulets, feathers or tissue paper plumes.

So, too, it was with their garments. Many rode in simple white blouses and wide white trousers with common sandals on their bare feet. Others shone in bright pink or quaintly speckled shirts with gaudy colored *zarapes* slung over their shoulders, or across their laps. Others again wore fringed leather *chaparrejos* on their legs, or long buckled gaiters, or top boots coming above their knees, or leggings made of spotted doeskin or the pelt of the tiger cat. Almost all carried amulets or scapularies hung around their necks.

Most of the leaders rode leather-clad from head to heel, with short embroidered *bolero* jackets, skin-tight trousers, bright silk neckerchiefs, and enormous silver encrusted spurs clanking on their heels.

Even greater variety than in the spurs was to be seen in the curiously braided and tasseled quirts carried by most of the riders, and in the differently shaped saddles, with embroidered cinches, horsehair bridles and hackamores, offset by bright red saddle blankets with pompons or tasseled fringes peeking out under saddlebags of every conceivable variety and description, from wolf pelts and spotted jaguar skins, or silver studded, carved leather flaps, down to common canvas sacking.



All this variegated horsegear was displayed on mounts even more various than their leather trappings. Big horses and little runts; stallions and mares; mules and jennets; old broken down hacks and two-year-old colts; imported thorobreds and ranger mustangs; coal blacks, snow whites; pintos and buckskins, with thousands of other steeds of every conceivable color, shape, gait, breeding and brand.

Tho all these thousands of country-bred horses were galloped unshod over the roughest of city cobblestones none went lame; neither did I see a single horse with a bloody mouth or flank. What better proof of the thoro horsemanship of their riders?

Among all those wild horsemen who followed Zapata's banner, there were several women riding armed and spurred amidst the ranks of the men.

Altogether I counted six of these Amazons. They rode side saddles and were dressed like ordinary Mexican country girls, except one, who wore boy's clothes and rode astride. Her hair was cut short and she looked so much like a boy that I should have overlooked her in the ranks had not the people standing next to me in the crowd pointed her out to me as *la bandida*—the "girl bandit." Her lover, riding beside her in the ranks, was a bandit, so they told me, well known to the people of Cuernavaca.

He must have been an unusually no-

PASCUAL OROZCO ZOLIOS AND A GROUP OF INSURRECTOS

torious bandit, for even at the supreme moment of triumph he rode with a silk kerchief over his face. He was by no means the only one in that parade who preferred to ride masked.

When I first saw so many of Zapata's followers riding with bandanas up to their eyes I thought that they covered open wounds—for not a few of those riding in the ranks still wore bloody bandages and slings—but it was soon ex-

plained to me by the bystanders that the masked men were oldtime robbers who did not care to risk recognition.

When Zapata first recruited his followers, they told me, he had drawn to himself every outlaw and fugitive from justice who up to that time had been hiding in the Morelos hills or in the vast underground caves of Cacahuimilpa, near Cuernavaca.

Later, when Zapata and his men took Cuernavaca, Zapata opened the jail and penitentiary, and, putting a good rifle and a handful of cartridges into each convict's hands, he bade them help themselves to horses wherever they could find them. As there are several horse ranches and rich haciendas with celebrated racing studs in the immediate vicinity of Cuernavaca, it did not take long before all those new recruits went mounted on the best of horses, as was here to be seen.

After this great review of Zapata's bandit forces, Señor Madero committed the colossal blunder, as it turned out to be, of paying off all of Zapata's men for their alleged services in the Madero revolution, without putting an armed guard over them to see that they actually turned in their rifles and cartridges before returning to their homes.

The result of this was that Emiliano Zapata simply drew the sum of fifty thousand pesos set aside for himself and his followers, without bothering to turn in more than a few stacks of arms, after which he announced that he and his men would not give up any more arms unless they received twice the amount of the originally stipulated sum.

After this the misunderstanding between the newly constituted government authorities and the Zapata brothers grew apace. Zapata was summoned to the capital. He came defiantly, surrounded by an armed bodyguard. During his brief stay at one of the principal hotels in Mexico City he livened things up by shooting out all the windows of the *cantina* because they would not serve him with drinks after three in the morning.

On the following day he and his companions commandeered some half dozen city taxicabs and rode back to Cuernavaca, about 75 miles away. After this Zapata and his men in Morelos became quite unmanageable so far as the newly constituted authorities were concerned. Francisco de la Barra, Mexico's President-ad-interim, tried to temporize with the Zapata brothers for a while, after which Señor Madero, in his capacity as leader of the revolution, pending his election as constitutional President, made a special trip to Morelos to "smooth down" the enraged Zapatas.

But the "smoothing down" did not last, for within a week Zapata's followers were "shooting up" the columns of regular soldiers who had been sent to garrison the most important towns of Morelos, in response to the frantic appeals of the bandit-harried inhabitants of that State.

From this time forth the campaign between Zapata's bandit hordes and various expeditions of Government forces has been in full swing.

Zapata and his men, after being driven out of Cuernavaca, swung southeast to Yautepec and Cuautla, in Morelos, and after that southward to Jojutla, both of which towns were once more put to the sack.

About this time it was thought that the bandits could be brought to terms by moving against them with the former rebel forces of Generals Figueroa and Asúnsolo, now converted into loyal guards—for a consideration—but the Zapatistas, reinforced by the former rebel forces of "General" Almazan, another dissatisfied revolutionary leader, first inflicted a bloody reverse upon Figueroa's rurales, in the mountain fastnesses of the Sierra of Ocotlan, which separates the States of Morelos and Guerrero, after which they eluded them and the various Federal columns sent after them by beating their way eastward thru the State of Morelos and across the ravines of Amatzinac into the neighboring State of Puebla.

All this so-called "campaign," on the part of the Zapatistas was marked by acts of unbridled murder, arson and rapine. When the Government forces resorted to savage reprisals, such as burning down villages, imprisoning women and children, and hanging or shooting all men believed to be in league with Zapata, the warfare in these unhappy districts of Mexico naturally took a turn for

the worse, and the whole region became almost unhabitable.

The railway traffic between the capital and Morelos has been brought to a standstill since the recent holdup and massacre of railway passengers and their escort of armed soldiers half way between Mexico City and Cuernavaca, when forty persons were killed.

Since this event several of the railway stations and bridges along that line have been burned down by the Zapatistas, only a few hours from Mexico City, so that the railway service between the capital and the States of Morelos and Guerrero has had to be suspended altogether.

Following these outrages Zapata's brother, Eufemio, accompanied by young "General" Almazan with his followers from the State of Puebla, appeared before the city of Puebla and frightened the citizens of that staid old town almost out of their wits by sending in a formal summons for surrender, under pain of "adding another red page to the history of Mexico."

Once more Federal troops from the capital had to be rushed to this threatened quarter. On the day of their arrival, Eufemio Zapata succeeded in giving the people of Puebla another sensation by suddenly making his appearance in the heart of the town, at a popular restaurant, where he added to his impudence by signing his name with a bold flourish to the bill of fare, after which he nonchalantly mounted his waiting horse and cantered out of town, attended by two of his armed followers.

Since then the Zapatistas have cut off all communication between Puebla and the capital.

What the end of all this is to be nobody in Mexico ventures to foretell. Whatever the outcome, Emiliano Zapata and his brother Eufemio will not be forgotten when the score of the present revolution in Mexico comes to be settled.

CUERNAVACA, MEXICO.

A Circular Letter

BY M. E. N. HATHEWAY

SAYS Uncle Samuel, D. C.—
"As I looked round it seemed to me
'Twas time to let the war-cry cease,
And have another talk on Peace.
But tho I've spoken plain and free,
And almost urged the Powers that be,
I must confess," says Uncle S.,
"I have not met with much success.
The Russian Czar is in a huff
With all that Persian strife and stuff,
But says if he had time enough
He'd gladly meet us at The Hague
And testify that war's a plague.
And adds, 'What folks of common sense
Would bear its trouble and expense
Could they get what they need without it,
And that is all there is about it!
I'm cramped for space—to state it pat
I've hardly room to swing a cat!'
The King of Italy sent word
His *sentiments* were in accord
With my proposal, but that he
Could not engage as conferee—
That his chief duty now must be
To guard the rights of Tripoli;
As hostile races seek of late
To rend and subjugate the State,
And he must hold the balance straight.
And Kaiser William, too, declined—
He said he hoped I wouldn't mind
But he had watched so close and long
For fear that something would go wrong
In his dominions, here or there,
That he could scarcely sleep for care—
And with a little touch of gout
His nerves had almost given out,
And now, if Turkey *should* be carved
A crowd of neighbors nearly starved
Would rush in eager for a slice,
And some would try to get helped twice;
So he must keep around in sight,
To see the job was done up right.
And England's George and Mary said
They wanted Peace to go ahead,
But did not see their way quite clear
To push it much this present year.
Their recent trip across the sea
Had made such wear and tear, that she
Must put new ermine on the gowns,
And he must polish up the crowns;
As it would never do to shirk
An atom of this royal work,
Should they omit a single shine
The world would doubt their rights divine.
Well, now I've done my level best
I'll let the foreign forces rest;
Just where I stand I've made them know,
So back to cleaning house I'll go,
This task at home is pressing me"—
Says Uncle Samuel, D. C.

TAUNTON, MASS.

The College Course for Women

BY MARY LEAL HARKNESS, A.M., Ph.D.

PROFESSOR OF LATIN IN NEWCOMB COLLEGE.

THE higher education of women has for some years been a cause supposed to represent among its supporters the very highest advancement in thought. These supporters are now having the conceit taken out of them as very "back numbers" indeed by a newer school of educational theorists who have discovered that, instead of working out a great scheme of education adapted to woman's peculiar functions and destiny, the educators of young women have merely taught them to imitate the education of men; that whereas woman might have been provided with an entirely original and exquisitely becoming educational outfit of her very own, she has been deceived into thinking that she looks pretty in the ill-fitting garb of man's outgrown educational garments.

As their main point of attack is the college course and the studies leading directly to it, I should like to defend the position that any proposed plan for alteration or modification of woman's education which would reduce, upon howsoever plausible a pretext, the purely intellectual element in it, must eventuate in deterioration not alone of our sex, but of the people as a whole.

There are few things in present-day educational talk that please me less than the constant citation of the small percentage of young people who enter college as a major premise for the conclusion that it is our duty so to arrange our primary and secondary school courses that the percentage may grow smaller yet. Of course, the conclusion is not stated in these terms, but that is what it amounts to. For the so plausible argument that because so many boys and girls leave even the lower grades of the schools to go to work, therefore those grades should provide them with manual training sufficient to enable them to command a good wage in that work, is in reality a mere catering to a defective public sentiment by the very educator whose business it should be instead to remedy its defects. To encourage untaught children and their often equally untaught parents to believe that the best thing a school can give is something that will make it advantageous to get *out* of school as soon as possible, is not merely a ridiculous paradox, but it is giving up the hope of a future intelligent citizenship for the present gain of a citizenship of skilled hands and mediocre intellect—surely a very unsatisfying mess of pottage for any nation. To be sure, financial and other obstacles will make the college course an impossible goal for the majority, but it might be a much reduced majority if more were being done to make the goal seem worth while. If only the ambition for higher education were once inspired by giving poor boys and girls a glimpse of what lies beyond the door which is opened by it, they would find a way around that obstacle, even as poor boys and girls have done before. But instead of offering this glimpse, the critics of the cultural type of education, both for boys and girls, are proclaiming loudly that it does not fit them for "life." "Life," so it would appear, consists primarily of raising corn and making bread. If your boy and girl can do these two things well when they leave school, you may send them out in happy confidence to fight the battle of life. If in addition to these prime essentials the youth knows how to produce a hand-made table and the maid to create a one-piece gown, they lack nothing which can contribute to the making of that sacred foundation of the state, a happy home. If I seem to be putting this in exaggerated form, just consult any Sunday paper, and see what is heralded as the most striking educational advance of the region and the season. That the boys of another school have formed a corn club; that cooking has been introduced into another school for girls. The joyous acclaim of these educational (?) acquisitions assumes it as unquestioned that if a boy has raised some corn *and sold it for money*, if a girl has made something which her family can eat up with celerity

and a good digestion, the plane of their respective lives has been raised much nearer heaven.

There is always truth enough in every claim made for industrial education to carry conviction to that sort of mind characterized some nineteen centuries ago as "having no deepness of earth." The zealous advocates of industrial and vocational training in schools urge that it is their object to elevate all forms of honorable toil in the eyes of mankind, and no one, to be sure, can quarrel with so estimable an object. But it is not now, and never has been, or I am mistaken, the educated class who look upon manual labor as a degrading thing. It is precisely the unlettered or little lettered who have always believed that such employment is "menial." How do the pedagogs who are going to "fit young people for life" with this glorified new system of "giving them only what they are going to need" after school days think that they can lead the unlearned to a saner view of life's values if they reduce still farther their already limited study of books?

That in regions where young persons can receive no impulse toward cleanliness and beauty from their home life it is properly the work of the schools both to give that impulse and direct it after it has been awakened, I do not doubt. But if the schools aim no higher than to implant a taste for better home surroundings I believe that they will only have achieved a temporary good which will eventually bear fruit in a demand for more physical comforts, but not for corresponding intellectual good. To my mind the *essential* studies to every scheme of education are those which train to clear reasoning and the power of lucid expression—pre-eminently mathematics and language work. In schools located where industrial and domestic training really are needed to supplement the lack in home surroundings, they should not supplant these essential studies, but serve for recreation and physical exercise, so that the time now spent in play or in work at home would be spent in equally restful or useful pursuits, but under a supervision that would see that they actually were made profitable or restful. And if it is vital to a child's "preparation for life" that *a teacher* should point out to him such profound truths as that a bird has two feet and two wings and one tail, let it be pointed out in woods or parks rather than in the schoolroom in the hours which, with all deference to those who hold the adverse view, the child should be devoting to mental arithmetic.

The enthusiasts for the vocational school assume that manual training, domestic science, nature study and the like contain all the mental discipline and educative power of the culture studies which they would replace, but it seems to me that this assumption has a very inconsiderable basis of fact, even under the best conditions. And the question of what is the most valuable kind of education for young persons is not to be fairly answered by comparing the product which specialists from a great teachers' college may turn out in industrial work with the efforts of the half-educated country school teacher in grammar and arithmetic. And not only must *the same quality* of work in each of the educational systems be compared if any valid conclusions are to be drawn, but another thing must be considered. What reason is there to suppose that if nature study, manual training and housekeeping were made to predominate in our schools instead of the studies hallowed by scholastic tradition, the average excellence of their teaching would be in the least higher? Is it not reasonable to see that there must be a condition precisely parallel to that now existing for the orthodox curriculum—a few well-trained, well-paid specialists doing good work in our cities and larger institutions of learning, ill-taught, ill-paid and unambitious teachers spreading low ideals and slovenly methods in the country and the low-salaried schools generally? Fancy scientific agriculture being taught in schools by a lot of women who have never even successfully raised a pansy bed! That is the sort of thing we should surely have. If you cannot now prevent school boards from hiring teachers of English grammar who cannot tell "lay" from "lie," do you fondly imagine that they are going to show a more developed educational conscience in employing teachers of the industrial arts? No doubt the public

has a right to complain of the amount of poor teaching which it pays taxes to maintain, but the public ought to be made to see that it is not necessarily thru changing the subjects taught that it is going to get its money's worth.

Last summer I listened to a flowery Chautauqua lecturer, who, however, was distinctly not casting any floral tributes at the feet of the modern pedagog. His motto was: "Get the children into touch with nature; do not waste their precious souls on dry and profitless grammar and history and mathematics." To illustrate the failure of our schools to impart a knowledge even of the commonest facts he resorted to anecdote. A visitor to a graded school elected to question the pupils concerning the discoverer of America. Not finding a superabundance of knowledge in regard to the distinguished explorer, he finally said, "Why, children, I don't suppose you even know that Columbus is dead." Hereupon one small boy piped up sympathetically, "Why, no; I hadn't even heard that he was ill."

The audience seemed considerably impprest by the logic of this illustration, but an old and notably successful teacher murmured to me, "If the teacher had only kept them in touch with nature, I suppose of course they *would* have heard of it."

I hope that the moral of my illustration is not obscure. It is intended to be that much that is being urged as necessary to fit young women especially for life is no more actually calculated to do it than keeping those children in touch with nature would have given them an intimate knowledge of Christopher Columbus. It seems to me that numerous objectors to the existent college course for women on the ground that it contains many things that a woman never will need in later life have a very insufficient comprehension of what a woman's life should be, and of what, if she is going to be a human being and not merely a female, she "needs" to make her truly useful and happy. For as a half of the human race she needs every sort of study which will develop her intellect and her reasoning power to precisely the same extent that the male half of the race does. And of the studies tending to develop manual deftness, the esthetic sense, neatness and cleanliness, if there is any difference in the degree to which the two sexes require them, women need them rather the less of the two, because, either by a real sex difference or the accumulated inheritance from housekeeping ancestresses, women already possess the more of these qualities. Yet the new educational scheme proposes to emphasize yet farther something in which woman is now rather over-developed, but expects to maintain her intellectual balance by making these things in her "scientific" instead of merely instinctive. In my opinion the last and least thing that needs to be taught to young girls is that marriage, motherhood and the care of the home form the one real vocation of womankind, and that any other callings in which they may engage are unfortunate makeshifts arising from their having missed the sole divinely appointed one. For that is the sort of doctrine which is in line with all their traditions, and to emphasize it still farther is not to give any new educative impulse to their lives, but to encourage them to stick in the same rut which has so long determined the direction of feminine life. The highest point of outlook to which the road bordered by this rut seems to have been able to lead mothers of today is commonly exprest in terms of the following maternal formula: "I want my daughter to learn something in school so that if she ever *has* to work, she will be able to support herself." A noble sentiment, is it not? My highest hope for my daughter is that she may attain the place for which she was designed by her Creator of dependence upon the bounty of some amiable male creature with a good income, but if she should be among those for whom the designs of an omnipotent God unaccountably miscarry, I wish her teachers to have provided her with some accomplishment convertible into sufficient income to keep her out of the poorhouse. That is all. There is no thought of the happiness which lies in the acquisition of knowledge itself, still less of the happiness and usefulness of the woman who fits herself for and pursues some form of professional life, not because she is forced into it thru failure to marry or necessity of self-support, but because she sees in it the truest means of serving mankind and developing her own character. There is also a fact which

we are in danger of forgetting in this age consecrated to specialization, namely, that there are a number of callings for which the best preparation is not secured by an over-specialized training in what we conceive to be their peculiar functions. Motherhood appears to me to stand at the very head of the list. The poorest mothers I have ever seen are those in whom the domestic qualities have been most developed, and who have been trained to believe that only as housekeepers and nurses of children will they have attained the true success of feminine life.

The college courses for women had in the last thirty years, I think, been awakening some realization of these things, when came the domestic economists, bringing a really good thing, but weakening its great possibilities thru trying to prove its goodness by arguing every other thing in feminine education bad. Now, I believe in domestic science, but I do not believe in the disposition of its promoters to "want the earth." A young domestic science graduate told me recently that an important feature of her course was planning what could be left out of the present school and college curriculum to make a place for domestic science. I trust that my estimate of this sort of pedagogic effort was in no way affected by the added information that the subject selected for elimination was Latin. To replace the language which has molded the speech and thought of all succeeding ages by a course in making fudge! And that is what they do, you know, for I have seen it with these eyes in published courses for domestic science classes. No doubt there is a certain spiritual uplift received from making fudge by truly scientific—and prayerful—methods, which is missed when you make it over a gas-burner in your own bedroom, and after retiring hours at that. I suppose there is even a scientific way of stirring it that does not make your arm ache, and develops brain matter as well as muscle. But considering that hardly a girl has gone to college in the past twenty years who has not learned to make fudge purely as an extra to courses most rigidly scholastic, it seems to me that the educational gain derived from making fudge as something to count toward a degree scarcely vindicates its transference from bedroom to classroom.

Whatever a woman's predominant occupation, she becomes really fitted for life only in proportion as she develops her mind and soul. Every study which enables her to know art and literature better, to understand better some branch of science, some period of history, the economic tendencies of certain national life, and thus to see the inter-relation of all literature, all science, all history and all life, is needed for that development. The courses in household economy do embrace some subjects unquestionably educative in their effects. But that as a whole they are too one-sided is shown by the very educational ideals preached by their graduates; that that very one-sidedness makes them defective even on what is supposed to be their strongest side, the scientific, has been the unasked testimony to me of science teachers who have happened to have working together in their classes regular academic students and students from the domestic science departments of the same institution. It is undoubtedly a good thing to feed and house your family according to the latest dictates of science, but the modern advocates of special training for motherhood seem to assume that children never grow beyond the stages of colic and teething, and to admit as a truth the adage which I myself have always been charitably inclined to believe slanderous—that the way to a man's heart really *is* thru his stomach. For no suggestion seems to be made that a woman requires a trained intellect and broad interests to meet dangers and needs in her family no less acute and vital than indigestion and the ailments of infancy.

Whatever may be the opinion as to woman's becoming "sphere," it is certain that the impulse which is forcing her into a share of the civic and educational life of every community is one that is destined to increase rather than decrease. If her share is to be a worthy one, her young womanhood must have every form of training which will make her views of education, of morality, of government national and municipal, broad and sane.

New Orleans, La.

THE EDUCATIONAL BOOKS OF THE YEAR

MANY books intended primarily for teachers or for pupils have been reviewed during the past year in our regular weekly department of literary criticism, when they were of some special interest to the general reader, but most of the publications of this class are reserved for this issue, where they can be compared as to their relative merits by teachers and for teachers. It is after all a question of relative merit, because the school books now being produced in the United States are almost uniformly of high quality. There is among them no such wide variation from excellence to worthlessness or worse as, for example, exists between novels or biographies or volumes of verse for the year. This is partly, of course, because the rigid structure of our school system does not permit of any great originality in scope or method. A new book must "fit in" or it does not get in, and this tends toward uniformity and conventionality. The chief changes that we note from year to year are a closer application of lessons to life, a greater differentiation among textbooks, adapting them to special classes and grades, a more careful consideration of the order of treatment and method of presentation, and a continuous improvement in typography, format and illustration. Many of these books are so attractive that even the reviewer can hardly resist reading them, and, indeed, learning from them, notwithstanding that *ex officio* he is supposed to know it all already. If this improvement in textbooks keeps on the teacher will become superfluous unless he discovers that he has other duties than the mere conveyance of information and the elucidation of unnecessary difficulties.

English

The Age of Alfred. By E. J. Snell. Macmillan. $3.

Medieval English Literature. By W. P. Ker. Home University Library. Holt. 50 cents.

Standard Short Course for Evening Schools. By William Estabrook Chancellor. American Book. 50 cents.

First Reader for Foreigners. By Mary F. Sharpe. American Book. 40 cents.

First Lessons in English for Foreigners in Evening Schools. By Frederick Houghton. American Book. 40 cents.

English for New Americans. By W. Stanwood Field and Mary E. Coveney. Silver Burdett. 60 cents.

Early Stories and Songs. By Mary Clark Barnes. New York: Revell. 60 cents.

Everyday English. Book One. By Franklin T. Baker and Ashley H. Thorndike. Macmillan. 35 cents.

New Composition-Rhetoric. By Fred Newton Scott and Joseph Villiers Denney. Allyn and Bacon. $1.20.

New Composition and Rhetoric for Schools. By Robert Herrick and Lindsay Todd Damon. Scott, Foresman. $1.

Study of the Paragraph. By Helen Thomas. American Book Co. 50 cents.

English Composition in Theory and Practice. By Henry Seidel Canby, Frederick Erastus Pierce, Henry Noble MacCracken, Alfred Arundel May, Thomas Goddard Wright. Macmillan. $1.25.

English for Secondary Schools. By W. F. Webster. Houghton. 90 cents.

Elementary English. By Lillian G. Kimball. Book One, 40 cents; Book Two, 60 cents. American Book.

Expository Writing. By Maurice Garland Fulton. Macmillan. $1.40.

Rhetorical Principles of Narration. By Carroll Lewis Maxcey. Houghton Mifflin. $1.25.

Essentials of Exposition and Argument. By William Trufant Foster. Houghton Mifflin. 90 cents.

Practical Training in English. By H. A. Kellow. Heath. 75 cents.

Sources of Interest in High School English. By C. Edward Jones. American Book. 80 cents.

Elements of Phonetics, English, French and German. Translated and Adapted by Walter Rippmann from Professor Vietor's "Kleine Phonetik." Dutton. 75 cents.

Art of Effective Public Speaking. By Ernest Pertwee. Dutton. $1.25.

American Oratory of Today. Edited by Edwin DuBois Shurter. Austin, Texas: South-West Pub. Co. $1.75.

Great Speeches and How to Make Them. By Grenville Kleiser. Funk & Wagnalls. $1.35.

High School Debate Book. By E. C. Robbins. McClurg. $1.

Riverside Readers. By J. H. Van Sickle and W. Seegmiller, assisted by F. Jenkins. Second Reader, 40 cents; Third Reader, 50 cents; Fourth Reader, 55 cents. Boston: Houghton Mifflin.

Fifth Reader. By Clarence F. Carroll and Sarah C. Brooks. Appleton. 45 cents.

Progressive Road to Reading. Book Four. By G. Burchill, W. L. Ettinger and E. D. Shimer. Silver, Burdett. 50 cents.

Everychild's Series Old Time Tales. By Kate F. Oswell. *In Those Days.* By Ella B. Hallock. Macmillan. 40 cents.

Seven Champions of Christendom. By Agnes R. Matthews. Ginn. 45 cents.

Little Stories of England. By Maude Barrows Dutton. American Book. 40 cents.

Around the Fire. By H. M. Burr. New York: Association Press. 75 cents.

Trading and Exploring. By Agnes Vinton Luther. American Book. 40 cents.

Cave, Mound and Lake Dwellers. By Florence Holbrook. Boston: Heath. 40 cents.

Indian Stories. By Cicero Newell. Silver Burdett. 50 cents.

Bird Stories from Burroughs. Sketches of Bird Life taken from the works of John Burroughs. Boston: Houghton, Mifflin. 60 cents.

Our Common Friends and Foes. By Edwin Arthur Turner. American Book. 30 cents.

In Fableland. By Emma Serl. Silver Burdett. 45 cents.

Heroes of Everyday Life. By Fanny E. Coe. Ginn. 40 cents.

Friendship of Nations. By Lucile Gulliver. Ginn. 60 cents.

Fairy Tales a Child Can Read and Act. By Lillian Edith Nixon. Doubleday. 75 cents.

Children's Classics in Dramatic Form. Book Five. By Augusta Stevenson. Boston: Houghton, Mifflin. 30 cents.

The Mother Goose Reader. By C. W. Mickens and Louise Robinson. Silver, Burdett. 36 cents.

Golden Treasury, Third Reader. By Charles M. Stebbins. American Book. 48 cents.

Primary Language Lessons. By Emma Serl. American Book. 35 cents.

Child's Reader in Verse. By Emma L. Eldridge. American Book. 25 cents.

Industrial Primer. By Mary B. Grubb and Frances Lilian Taylor. Boston: Heath. 30 cents.

Heroes and Greathearts and Their Animal Friends. By John T. Dale. Boston: Heath. 60 cents.

Everyman's Library. Piers Plowman, The Vision of a People's Christ. By William Langland. *Arthurian Tales and Chronicles.* By Wace and Layamon. Dutton. 35 cents each.

Selections from Chaucer. Edited by Clarence Griffin Child. Boston: Heath. 75 cents.

Tudor Shakespeare. Edited by William Allan Neilson and Ashley Horace Thorndike. 35 cents. 11 Volumes. Macmillan.

Ben Greet Shakespeare. The Merchant of Venice, 60 cents; *As You Like it,* 60 cents. Doubleday.

Shakespeare's King Henry the Fifth. Edited by Edgar Coit Morris. Silver. Burdett. 30 cents.

Shakespeare's Tragedy of Hamlet. By Henry N. Hudson. Ginn. 45 cents.

Masterpieces of the English Drama. General Editor, Felix E. Schelling. Beaumont and Fletcher. Edited by Felix E. Schelling. Christopher Marlowe. With an Introduction by William Lyon Phelps. Webster and Tourneur. With an Introduction by Ashley H. Thorndike. American Book. 70 cents each.

English Readings for Schools. General Editor, Wilbur Lucius Cross. *Scott's Ivanhoe,* 50 cents; *Macaulay's Essays on Clive and Hastings,* 35 cents; *Stevenson's Inland Voyage and Travels with a Donkey,* 40 cents; *Milton's l'Allegro, Il Penseroso, Comus and Lycidas,* 25 cents; *Macaulay's Life of Johnson,* 25 cents; *Selections from Huxley,* 25 cents; *English Lyrics from Dryden to Burns,* 35 cents. Holt.

Riverside Literature Series. Education Areopagitica and *Commonwealth.* By John Milton. Edited by Laura E. Lockwood. *Dickens's Reader.* Arranged by Ella M. Powers. Houghton, Mifflin. 40 cents each.

Macmillan Pocket Classics. Odyssey of Homer. Translated into English Verse by Alexander Pope. Edited by Edgar S. Shumway and Waldo Shumway. *Selected Poems.* Edited by Henry W. Boynton. Macmillan. 25 cents.

Lake English Classics. Edited by Lindsay Todd Damon. *Oregon Trail.* By Francis Parkman, 40 cents; *Shorter English Poems.* Edited by Vida D. Scudder, 35 cents. Chicago: Scott, Foresman.

English Lyrical Poetry. By Edward Bliss Reed. Yale University Press. $2.

Poems and Tales of Edgar Allan Poe. Edited by Robert Armistead Stewart. Richmond, Va.: B. F Johnson Pub. Co. 35 cents.

Five Short Courses of Reading in English Literature. By C. T. Winchester. Ginn. 50 cents.

What Books to Read and How to Read. By David Pryde and Francis W. Halsey. Funk & Wagnalls. 75 cents.

An Introduction to the English Classics. By W. P. Trent, C. L. Hanson, W. T. Brewster. Ginn. $1.25.

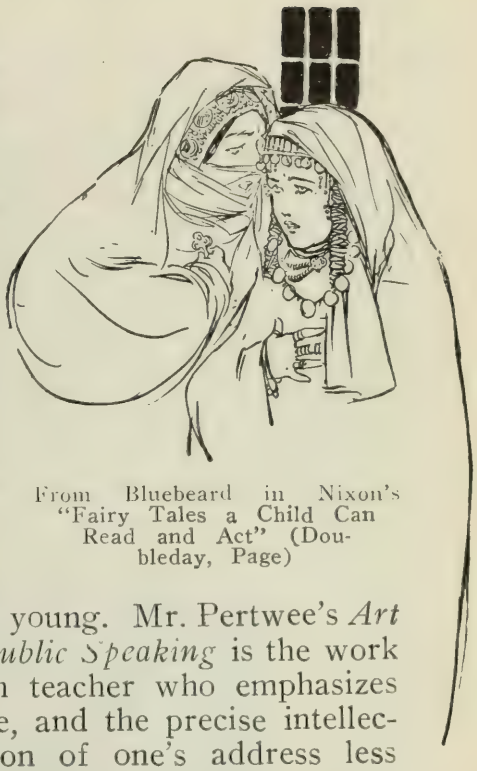
The eighty-five volumes which are included in this survey do not exhaust the publications of the year in the field of English instruction, but they fairly represent it. Curiously enough, there is not a formal grammar in the list. The teaching of English grammar tends nowadays to fall between two stools—the austere philology of the graduate school and the inconsistent and confusing manuals of the secondary schools. At least two things are needed in the elementary instruction of English grammar—essential

THE BATTLE WITH THE CANNON BY VICTOR HUGO
From "The Carroll and Brooks Fifth Reader" (Appleton)

agreement upon its terminology and definitions, and an understanding of the nature of grammatical authority, of "right" and "wrong" as applied to questions of syntax. The question of terminology, at least, is now under special discussion both here and in Great Britain. The temporary pause in the publication of school grammars may therefore be a hopeful sign.

The publications of the year fall into broad divisions. There are books that aim to teach how to speak or to write English; there are readers for grammar grades and specially edited texts for high school and college classes; and books also for the general reader that tell him what he should read and how he may get the most profit out of his reading. Besides these groups the list contains two historical manuals of special interest, F. J. Snell's *The Age of Alfred* and Professor Ker's *Medieval English Literature.* Mr. Snell's volume will be a useful member of an uneven series, of which Seccombe's "The Age of Johnson" and Herford's "The Age of Wordsworth" are most admirable examples. Professor Ker gives a swift and vivid sketch of a difficult period with a proportion and detail which are possible only to the literary skill and to the ripe scholarship in this period, in which few are his equal.

A distinctive note in the text books on writing English is the effort to meet specific social needs in a specific way. Of especial interest is the group of texts designed to aid our foreign-born population in acquiring English. Superintendent Chancellor combines in a single volume *A Standard Short Course for Evening Schools,* elementary instruction for adult beginners in English, and in arithmetic, civil government and physiology. Both the substance and the method of Mary F. Sharpe's *First Reader for Foreigners* and of Frederick Houghton's *First Lessons in English for Foreigners in Evening Schools* are, while arranged progressively, more elementary and more homely than those in Mr. Chancellor's volume. Like them in this respect is *English for New Americans,* by W. Stanwood Field and Mary E. Coveney; but the extensive vocabulary of this book in Armenian, Greek, Italian, Lithuanian, Polish, Russian, Swedish, Syriac and Yiddish, will especially adapt it for use with classes which include foreigners of diverse nationalities. Mary Clark Barnes's *Early Stories and Songs,* likewise designed to instruct foreigners in English, will by its use of biblical stories be especially suited to the use of mission schools.

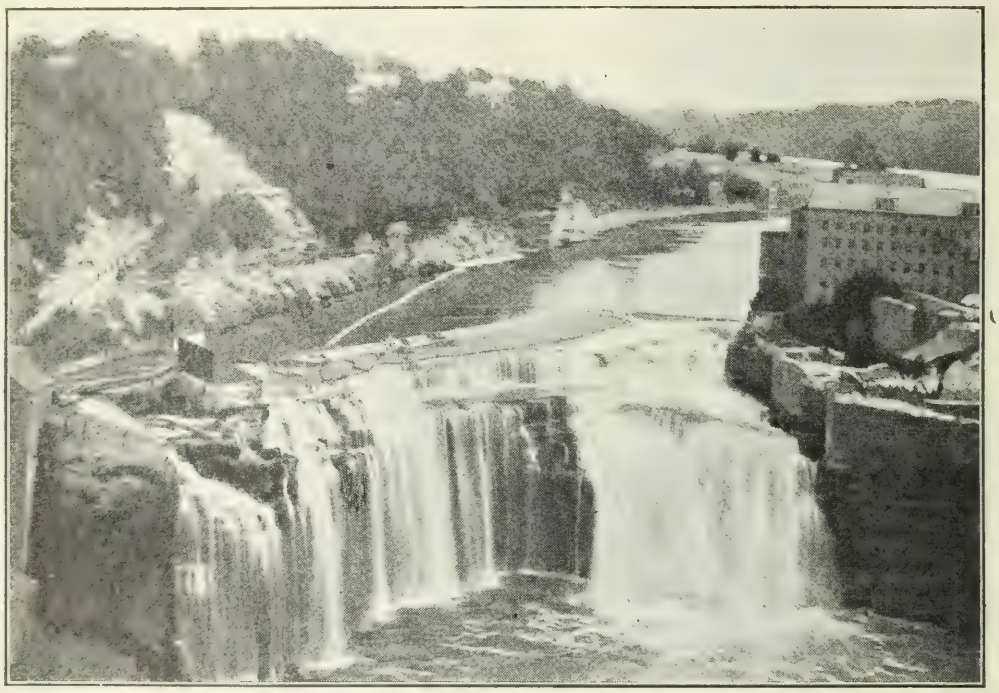


Another result of the same impulse to social adaptation is the insertion of chapters on the technical forms of business correspondence. Professors Baker and Thorndike, in *Everyday English,* Book I, allow no one to surpass them in zeal for the practical aspects of letter writing. On page 155 the grade pupil is requested to "frame a protest" to apply when he has been away from home during August and closed his house, but afterward gets "a gas bill of the usual size, just the same." The distinctive emphasis of this book is, however, upon the principle that language is primarily oral. In real life habits of speaking are apt to control habits of writing. Accordingly a full third of the exercises are devoted to oral rather than to written composition. Messrs. Scott and Denney, in their *New Composition-Rhetoric,* a new edition of their well-known work, continue their characteristic stress upon the paragraph as the unit of thought and of composition.

On the other hand, Messrs. Herrick and Damon, in their new and thoroly revised edition of *New Composition and Rhetoric for Schools,* while giving to the paragraph, as such, a total of forty-eight pages, devote to the sentence a total of 113 pages, and to the problems of diction 103. "From the period in which the paragraph occupied the center of the stage in rhetorical instruction," they say in their preface, "we are now fortunately emerging." This is not the case with *The Study of the Paragraph,* by Miss Helen Thomas. This book might have emerged from a course in the psychology of child study. Practice in writing the paragraph passes, we are told, thru the formal stage of "Imitation," and the transitory stage of "Suggestion," to achieved personal expression in the stage of "Originality." The book, while based on a valid progression, falls, itself, into a "transitory" stage between a thesis in descriptive psychology and a text book in composition.

Two other well-known books on composition come to new editions this year—*English Composition in Theory and Practice,* by a syndicate of Yale instructors, headed by Professor Canby, and *English for Secondary Schools,* by W. F. Webster. The first named has been somewhat recast in order better to harmonize the points of view and methods of the several collaborators. Mr. Webster's new edition continues his characteristic effort to unite the teaching of composition and of literature. It is surprising that the author should retain the inaccurate and misleading musical notation as a means of marking the scansion of verse.

Several text books dealings with special kinds of composition deserve comment. Professor Fulton has prepared, in *Expository Writing,* a text illustrating by abundant and complete examples how expository processes are modified by various kinds of functions and themes, especially scientific ones. Professor Maxcey's interesting *Rhetorical Principles of Narration* is available either as a text book in advanced courses in composition or as a manual for use in the literary study of fiction. Houghton, Mifflin & Co. have issued President Foster's valuable *Argumentation and Debate* in an edition revised and supplemented for use in secondary schools under the title *Essentials of Exposition and Argument.* Many college instructors will regret that the new work will, as it comes into use in secondary schools, tend to lessen the availability of its predecessor for college courses.



Public speaking is certainly destined to a renaissance in our schools and colleges—but our manuals, for the most part, still leave much to be desired. We have manuals of debate, and manuals which deal with the conditions of effective public address; and we are beginning indeed to cultivate oral English in our schools. But the pronunciation of our language, which lies at the root of the whole matter, we still outrageously neglect. We have in America adopted no popular manual like Rippman's *Elements of Phonetics,* and if we should, we have few who could teach others how to achieve a pleasing pronunciation. There is more of culture and of real social efficiency involved in properly pronouncing our language than we yet dream of, and fame awaits the man who will educate the nasal twang out of the American voice. He must catch his Americans young. Mr. Pertwee's *Art of Effective Public Speaking* is the work of an English teacher who emphasizes elocution more, and the precise intellectual preparation of one's address less than a corresponding American teacher would do. Professor Shurter's *American Oratory of Today* is little more than a large collection of declamations chosen from contemporary addresses. As such it will serve a useful purpose. Mr. Kleiser's *Great Speeches and How to Make Them* provokes a smile by its ambitious title, but contains many practical suggestions. Mr. Robbins, in his *High School Debate Book,* presents, with a brief chapter on the art of debate, eighteen briefs upon representative public questions, for the use of amateur debaters. The bibliographies are useful, but the ready-made briefs relieve the young debater of too much of the analytical discipline in which the distinctive value of debating greatly lies.

From Bluebeard in Nixon's "Fairy Tales a Child Can Read and Act" (Doubleday, Page)

The year has been prolific in readers. Twenty-one titles stand in our list. Collectively the array is an encouraging witness to the progress of illustration and printing in this field. Aside from the interest of their contents, the *Riverside Readers,* by J. H. Van Sickle and W. Seegmiller, are really remarkable as examples of typography and color-printing. But what is true in a superlative sense of this series is true in scarcely less degree of other readers, notably the series by C. F. Carroll and Sarah C. Brooks, and the volumes in the *Progressive Road to Reading,* by Burchill, Ettinger and Shimer. The most strik-

ing thing to the reviewer of these numerous readers is their illustration of the way in which the English classroom in the grammar-school is recognized as the place of instruction, not in "English" only, but in folk lore, history, animal life, exploration and applied morals. The Greeks would have liked the idea. A marked feature is the appearance of many supplementary readers, each adjusted to some special kind of theme or interest. Among such are *Folk Tales,* drawn from primitive races, by Kate F. Oswell; *The Seven Champions of Christendom,* in which Agnes R. Matthews has put into simple modern English much of the fadeless charm of a famous romance of chivalry; *Little Stories of England,* containing stories by Maude Barrows Dutton about men and women who have been prominent in the progress of the English race; H. M. Burr's *Around the Fire,* in which Anglo-Saxon tales are collected and retold; and *Trading and Exploring,* one of a series of charming readers by Agnes Vinton Luther, is set forth the progress of occupations, from fishing and hunting to commerce and exploration, including stories of the Babylonians, the Phenicians, the Venetians, the Portuguese, the Dutch and other peoples. Florence Holbrook has made a grade reader dealing with *Cave, Mound and Lake Dwellers. Indian Stories* records stories written from the first-hand experience of Major Cicero Newell, a former Indian agent. In *Bird Stories from John Burroughs* and *Our Common Friends and Foes* we have two readers, one in the charming style of our chief literary naturalist, and the other written to interest children in the lives of the toad, the quail, the owl, the mosquito, the house-fly, the cabbage butterfly and the chickadee. To make ethical ideals attractive, Miss Serl has retold in a graded series thirty-four of Æsop's fables for *In Fableland;* and showing that bravery is not a military virtue alone, Fanny Coe has written *Heroes of Everyday Life.* The incidents chosen are actual events in the lives of real Americans engaged in every day callings. Gulliver's *Friendship of Nations,* which we have previously noticed, is also a "peace reader." It is unsafe to rely upon a photographer for captions. The picture in the *Friendship of Nations* entitled "A Maori Hunter with Boomerang," is misleading, since the boomerang is confined to Australia. Those who are seeking to develop the dramatic instinct in very young people will find

WATER-POWER ON GENESEE RIVER, ROCHESTER
From Dryer's "High School Geography" (A. B. C.)

keen interest in Lillian E. Nixon's *Fairy Tales a Child Can Read and Act.* Children in the seventh and eighth grades will find material for acting in *Children's Classics in Dramatic Form: Book Five,* by Augusta Stevenson.

The publication of classic literary texts, with interpretative editing to adapt them to school or to general public, goes on apace. In general, the tendency is to keep the amount of annotation low, to make its central motive the stimulus of literary appreciation. In this way the world is seen to move. Nevertheless, *The Everyman's Library,* which has in so many ways been a boon to the public, should include in the editorial work of such useful reprints as those of *Piers Plowman* and *Arthurian Tales and Chronicles,* by Wace and Layamon, a really definite statement of the way in which the original text has been modified.

Professor Childs, whose ample editing of the *Selections from Chaucer* combines appreciation and scholarship in uncommon degree, has by his edition placed under distinct obligation the increasing number of secondary school teachers who wish to read Chaucer with their classes. *The Tudor Shakespeare* presents eleven plays under the general editorship of Prof. W. A. Neilson, of Harvard University.

The text is the scholarly Neilson text, copyrighted in 1906, and the editorial work is, while small in amount, extremely definite and satisfying. Ben Greet is issuing thru Doubleday, Page & Co. an artistic edition of Shakespeare's plays, with a novel and interesting purpose. The text of each play is annotated for the use of young readers and amateur actors; and the text is so arranged that, as the book lies open, the right-hand page carries the text and the left-hand directions for "stage business." An extremely informing essay prefaces each volume on "A Few General Rules or Customs of Acting." Under the supervision of Professor Schelling the American Book Company is issuing a new series of *Masterpieces of the English Drama.* It aims to present, for use in college classes, editions of important plays, outside of Shakespeare, from Marlowe to Goldsmith and Sheridan. Many of the plays have been comparatively inaccessible, and the scholarly editing of such men as Havelock Ellis, William Archer and Professors Thorndike and Phelps is especially grateful.

We shall conclude this survey with a glance at a group of manuals dealing with method in literary study. Professor Winchester's *Five Short Courses of Reading in English Literature* appears this year in a new edition. David Pryde publishes *What Books to Read and How to Read,* for which Francis W. Halsey writes an extended introduction. The book gives rather sober advice. One section urges the reader to peruse the preface of each book "carefully"; the next, to "take a comprehensive survey of the table of contents"; and yet a third, to "write out in your own language a summary of the facts you have read." Especial interest attaches to the *Introduction to the English Classics,* by Messrs. Trent, Hanson and Brewster. In this manual a stimulating essay on "Approaching the Classics" is followed by analysis, according to a definite system, of about sixty of the English classics usually read in secondary schools, distributed among the chief literary types. The method, while keenly analytic, is happily left in a suggestive form that does not deprive the teacher or the pupil of the joy of discovery.

Latin

Manual of Latin Word Formation for Secondary Schools. By Paul R. Jenks. Boston: Heath. 50 cents.

Second Year Latin for Sight Reading. By Arthur L. Janes. American Book. 40 cents.

Third Year Latin for Sight Reading. By John Edmund Barss. American Book. 40 cents.

Ritchie's First Steps in Latin and Second Steps in Latin. Edited by Frederick C. Staples. New York: Longmans, Green. $1.25.

Selected Letters of Pliny. Edited by Hugh Macmaster Kingery. Chicago: Scott, Foresman. 90 cents.

Cicero. Ten Orations and Selected Letters. Edited by J. Remsen Bishop, Frederick Alwin King and Nathan Wilbur Helm. American Book. $1.

Some years ago the fear that our boys would be overloaded with dry work led many of the colleges to let up what seemed to be an excessive amount of grammatical drill in Latin, and reading at sight—that is, what might be called guess reading—was favored; but examination day came along in due time, and guess reading became the wonder and admiration of the classroom. Grammat-

ical work was then lumped and taught in specialized books known as Exercises in Latin Composition. This was an effective reaction toward solid mental training, and remains of value to the student of language. The grammars were carefully milked for the creamery, and the bookmakers became the diligent "separators" for the benefit of those desiring to take the short road to learning. The sight reading, however, remained.

The half a dozen books now before us are all of them happily devised for extensive and intensive gormandizing in easy Latin. A book on *Latin Word Formation,* by Paul R. Jenks, covers derivation and composition of vocables, chiefly valuable in getting at the root words of a language for building purposes. It is hardly more than a hint in the right direction, but points the way to good study. *A Second Year Latin for Sight Reading,* by Arthur L. Janes, contains selections from Cæsar and Nepos, and *A Third Year Latin for Sight Reading,* by John Edmund Barss, covers the ground for Cicero and Sallust, mainly confined to the Catiline episode. Both these books have suggestive footnotes showing forms and vocabulary in exceptionally difficult cases. Both lack a terminal vocabulary, summing up the words scattered thru the page notes. Such a summary saves much searching of the back numbers and of the heart in pupils who have been born without the John Stuart memory. *Ritchie's First Steps* and *Second Steps in Latin* fulfils the office of primer and grammar, with easy exercises in rendering sentences back and forth in the idioms of Rome and Oxford, occasionally also in the idioms of London and New York. There is much of the hard tugging in the book generally credited to the old days in the schoolroom—not a bad thing by any means in the formation of mental muscle. *Selected Letters of Pliny,* edited by Hugh Macmaster Kingery, comprises the letters of the gentlemanly North Italian who was born among the hills of Como, and stood with his distinguished uncle under the ashen shower of Vesuvius in 79 A. D.—a man who knew well the Roman literary and country life and loved both. The introduction and notes lay particular stress on the literary circles of the Rome of the first century after Christ and the Flavian emperors. *Cicero: Ten Orations and Selected Letters,* is a carefully studied work designed for the secondary schools, and giving the student such help as he needs and as little lumbering of the notes as possible in the matter of German erudition. One can forgive the prefatory slur on our interest in Cicero "as an historical figure surrounded by people of little or no interest for us." Cicero may safely be left to take care of himself in that matter.

French and German

German Epics Retold. By M. Bine Holly. Pp. 336. American Book Co. 65 cents.
Hauff's Das Kalte Herz. Edited by F. J. Holzwarth Pp. 168. American Book Co. 35 cents.
Lose Blätter. By Erna M. Stoltze. Pp. 127. American Book Co. 30 cents
Wildenbruch's Der Letzte. Edited by J. H. Beckmann. Pp. 139. American Book Co. 30 cents.
Baumbach's Der Schwiegersohn und andere Erzählungen. Edited by Edward Manley. Pp. 224. Scott, Foresman & Co. 50 cents.
Blüthgen's Mama kommt and *Schanz's Die Alte.* Edited by Frederich Betz. Pp. 168. Scott, Foresman & Co. 50 cents.
Le Français et sa Patrie. By L. Raymond Talbot. Pp. 294. New York: B. H. Sanborn & Co. $1.
Short Stories for Oral French. By Anna W. Ballard. Pp. 126. New York: Charles Scribner's Sons. 75 cents.
German for Daily Use. By E. P. Prentys. New York: Wm. R. Jenkins Co. 50 cents.
An American in Germany. By E. E. Pattou. Boston: D. C. Heath. 75 cents.
Beginners' German. By Max Walter and Carl A Krause. Pp. 231. Charles Scribner's Sons.
Ein Sommer in Deutschland. By Edward Manley. Scott, Foresman. 90 cents.
French Newspaper Reader. By Félix Weill. Pp. 265. American Book Co. 50 cents.

That German is receiving more attention than French is shown by the increased number of new texts. Among them is Professor Holly's *German Epics Retold,* an admirable arrangement for the student whose stage is intermediate, and this book is only one of many well-edited editions of German prose. But some of the French texts also are decidedly welcome. *Le Français et sa Patrie,* for example. This is an American's reader for students of the elements, the aim being to provide matter easy enough for use in the first year of study, which will all the same interest students of the secondary school and college ages. The idea of providing a map of France, a plan of Paris, etc., is excellent; it is unfortunate that the scale of these is so small as to minimize their value. Different sections record the

LONDON BRIDGE IN THE DAYS OF ELIZABETH
Notice the Houses Built on the Bridge also the Heads Over the Gates. From Harding's "Story of Europe" (Scott, Foresman)

conversations (in French) of two young Americans in Geneva, who later proceed to Paris. In Paris, *Bonjour, Charles,* says "M. Fred Douglas"; *vous avez dormi assez tard. Il faut vous éveiller maintenant, car la bonne a apporté le petit dejeuner. Allons, levez-vous!*

All of which is excellent, except that we ourselves refuse to *nous lever* until we have consumed the *petit dejeuner* which *la bonne* has *apporté.*

The type of book which Mr. Talbot furnishes in *Le Français et sa Patrie* is useful alike to the school student and the student "on his own hook." We remember a confession of M. Gustave Lanson, of the Sorbonne, to the effect that he studied English for several years at Paris before he tested his knowledge by undertaking a Channel crossing. In a few hours he found himself at a table in a London restaurant, and couldn't make the waiter understand his order of beefsteak! Thereupon M. Lanson concluded that there was something defective about French instruction in the English language. All that has been altered, and the American who studies with Mr. Talbot as teacher will know how to say *bifstek* in the most approved boulevard fashion. The emphasis is perhaps less contemporaneous in Miss Anna W. Ballard's *Short Stories for Oral French,* but there can be no doubt that the book contains the material for excellent drill in conversation, concentration and combination.

Going to Germany, one should con E. P. Prentys's little book. *German for Daily Use.* This is in no sense a textbook; it is built for the traveler's side pocket. E. E. Patton's *An American in Germany* is only a little more bulky, tho it is intended for classroom use. Certain it is that the pendulum of pedagogy swings in these days from the theoretical to the practical, from the abstract to the concrete. For one "Amherst movement" there are many schools of agriculture, of applied science and of business established. *The Beginner's German,* that is offered by MM. Walter and Krause, is another attempt to make the German language more real to the student by beginning its study with conversation of the classroom and of everyday life. There is nothing especially new about this method—not even the omission of the vocabularies. Conversations of the kind recorded here have been common in modern language classrooms for years and have been included in grammars before, tho perhaps in less liberal amounts. *Beginners' German* is the printed record of a well-known and skilful language teacher's work. The conversational lessons are excellently contrived to sustain interest in the study and to teach the essentials of the language. With its map and songs, and

for the most part, admirably chosen reading selections, the book is redolent of German life and customs. Some of the grammatical questions are vague (*e. g.,* the last one in Lesson 32). *Wieder* (p. 167) should not be given as a variable prefix. With one or two exceptions it is always separable. Well printed and well arranged, this book will doubtless find a useful place abong the many introductory German grammars.

Ein Sommer in Deutschland is a novel and ingenious mode of making German easy and practical, a sort of combination phrase book and guide book thrown into dialog form. The intending tourist will also find it advisable to run thru it to brush up on colloquialisms, for it includes bills of fare, street signs and even student songs. The notes are refreshingly readable.

Among textbook makers in all the modern languages the effort is to produce books which will combine academic usefulness with inherent interest. In such a book as the *French Newspaper Reader* of Professor Weill the attempt is well rewarded. The passages chosen from the best and most alert of contemporary journals, from the *Temps* and the *Matin* to the *Revue Bleue* and the *Illustration,* make decidedly good reading; and, thanks to the survival of high literary standards even in the press, the student will in no wise suffer because these paragraphs were first published in newspapers and not in bound books. Even illustrations and advertisements are reproduced; there are questions based on the text that will serve as subjects for compositions; there are notes and a vocabulary. This is a unique and welcome volume, just in time for our new schools of journalism.

Mathematics

First Journeys in Numberland. By Ada Van Stone Harris and Lillian McLean Waldo. Scott, Foresman. 35 cents.
First Year in Number. By Franklin S. Hoyt and Harriet E. Peet. Houghton, Mifflin. 35 cents
Complete Business Arithmetic. By George H. Van Tuyl. American Book. $1.
First Year Algebra. By Webster Wells and Walter W Hart. Boston: Heath & Co. $1.
First Principles of Algebra. By H. E. Slaught and N. J. Lennes. Boston: Allyn and Bacon. $1.
Practical Algebra. Second Course. By Jos. V. Collins. American Book. 85 cents.
Plane Geometry. By C. A. Hart and Daniel D. Feldman. American Book. 80 cents.
Plane and Solid Geometry with Problems and Applications. By H. E. Slaught and N. J. Lennes. Boston: Allyn and Bacon. $1.25.
Brief Course in Analytic Geometry. By J. H. Tanner and Joseph Allen. American Book. $1.50.

In the case of mathematical texts especially it is unsafe to judge of the usefulness of a book solely from an examination of it. The only way to get an opinion that is really authoritative would be to give the reviewer a class of several sections and let him try a different book on each, and report at the end of the year. We have not adopted such a plan this year, so we can do little more than give an indication of the scope and character of each of the new volumes sent us.

First Journeys in Numberland is ultra-modern in method, highly concrete and pictorial, with flat tint prints worth looking at quite apart from their arithmetical implications. It aims to teach the child to estimate size and distance, to count change and tell time, as well as to add, divide, subtract and multiply. It is more of a laboratory manual than a textbook. The author makes his point of view clear by saying: "The child need not accept a number fact on faith, but he can actually work it out and live thru it until the knowledge becomes his by right of exploration and conquest." *First Year in Number* adopts essentially the same plan, but is not so fancifully illustrated and devotes more attention to routine drill in the fundamental processes. *The Complete Business Arithmetic* is a comprehensive textbook of over 400 pages, with practical exercises in such subjects as taxes, stocks, partial payments, customs duties, marking goods, building estimates, railroad time, etc. Short methods, speed tests and examinations are included. The author is teacher of business arithmetic in the New York City High School of Commerce. Wells and Hart's *First Year Algebra* and Slaught and Lennes's *First Principles of Algebra* are intended for the same class of students, and cover much the same ground in such a similar way that it would be rash for the reviewer to attempt to decide between them. An interesting feature in Collins's *Practical Algebra, Second Course,* is the introduction of portraits of the pioneers of algebra and historical notes at vari-

ous places. Hart and Feldman, in their *Plane Geometry,* also give portraits and notes illustrative of the history of the science. An ingenious innovation in Slaught and Lennes's *Plane and Solid Geometry* is the use of architectural designs, such as tile patterns, wall paper, parquet floors, ornamental windows, etc., to give the student practice in geometric construction and algebraic computation. Tanner and Allen's *Brief Course in Analytic Geometry* is an abridgement of the authors' well-known "Elementary Course."

Physics and Chemistry

Introduction to General Science with Experiments. By Percy E. Rowell. Macmillan. 75 cents.
General Science. By Bertha M. Clark. American Book. 80 cents.
Laboratory Manual in General Science. By Bertha M. Clark. American Book. 40 cents.
First Principles of Physics. By Henry S. Carhart and Horatio N. Chute. Boston: Allyn & Bacon. $1.25.
Applied Physics for Secondary Schools. By V. D. Hawkins. Longmans, Green. $1.
Chemistry, An Elementary Text-Book. By William Conger Morgan and James A. Lyman. Macmillan. $1.25.
Principles of Human Nutrition. By Whitman H. Jordan. Macmillan. $1.75.

The introduction of textbooks on "general science" has two pedagogical advantages; first, it breaks down the arbitrary and fictitious barriers that custom has erected between the several sciences, and second, it substitutes a practical grouping for a theoretical system. This idea has been carried to an extreme in Rowell's *Introduction to General Science,* where successive lessons treat of the construction of the siphon, the fixation of nitrogen, the testing of paints, the action of carbon dioxid, the nature of lightning, the cause of winds and the making of a kite, all because these topics have some connection with the atmosphere. This makes almost as scrappy reading as a daily paper, tho doubtless a good teacher could bring out the necessary continuity. The volume contains 212 lessons, covering, as may be inferred, a wide range of subjects, from the material of comets to the conduct of life. They are illustrated so far as possible by simple experiments and provided with reading references, in which chief use is made of the publications of the United States Department of Agriculture, for the purpose of encouraging the "bulletin habit." Clark's *General Science* is less ambitious in its scope and more logical, or, at least, more conventional in its arrangement. It is mostly confined to physics, tho with brief excursions into such subjects as bacteria and headache powders. It differs, however, from older textbooks in physics in being less mathematical and abstract. The accompanying *Laboratory Manual*

THE ENGLISH BEFORE CALAIS
From Lansing's "Patriots and Tyrants" (Ginn)

contains ninety-two experiments adapted to second-year high school students.

The names of Carhart and Chute have been known long enough to be generally received as a guarantee of excellence. Their *First Principles of Physics,* bearing the date of 1912, is a thoroly teachable textbook, with a good grasp of theory on the one hand and of every day applications on the other. Problems are abundant and the illustrations really illustrate. Twenty portraits of eminent physicists serve to introduce the student to the history of the science. A radical departure in the customary order is made by placing the mechanics of fluids before the mechanics of solids.

Hawkins's *Applied Physics* is something quite out of the ordinary and lives up to its title, for it deals with the real problems of our modern civilization, tho treating them in a thoroly scientific style. The chapter on electricity, for example, begins not with the properties of the ether or the peculiarities of amber, but with the dynamo, the most familiar of electrical instruments to the boy of today, and the author assures us that "it is no more difficult for the pupil to understand a three-phase alternator than to master the influence machine." Certainly the pupil who had mastered these 200 compact pages would have a grasp of the subject that few of them get from volumes five times the size. But it would take a teacher who knows more than most of them about shopwork and machinery to handle such a textbook. The problems are numerous and ingeniously practical, but there are no directions for the experiments of students or instructor.

Chemistry has suffered in the past even more than physics from a remoteness from life. Not a few pupils are "passed" in it without suspecting that it concerns much of anything outside the drugstore and laboratory. The effort to remedy this gives to the pages of Morgan and Lyman's new elementary textbook an unusual appearance. The illustration of rapid acidation is not a line sketch of phosphorus burning in a flask of oxygen, but a photograph of San Francisco on fire. The process of making nitrates from the air is pictured by a thunderstorm, as well as by the arc apparatus. Portraits of great chemists (mostly pretty poor) give the personal side. Arrows are used instead of the sign of equality to indicate the course of reactions. We are glad to see that the simplified spellings recommended some twenty years ago by the chemical section of the American Association—chlorin, oxid and sulfur, for example—are used thruout. Questions and problems are included, but not laboratory directions.

Jordan's *Principles of Human Nutrition* is intended for the use of the home reader and "short course" student as well as for college classes, so it is less technical and more practical than such books as Sherman's "Chemistry of Food and Nutrition," for example. Professor Jordan is one of the foremost authorities in the country on the feeding of animals, and here shows himself equally at home in the matter of feeding human beings. His discussion of such vexed questions as vegetarianism, raw food and the protein needs of the body is careful and just, and his advice in regard to dietetics, the selection of food and its preservation is practical and reliable. A hundred pages of the volume are taken up with tables of the analyses of American food materials. Professor Jordan also uses the spellings "oxid" and "sulfur," but not "chlorid."

Biology

Biology of the Seasons. By J. Arthur Thomson Holt. $2.75.

Plant Life and Evolution. By Douglas Houghton Campbell. Holt. $1.60.

Fertilizers and Crops. By Lucius L. Van Slyke. New York: Orange Judd Co. $2.50.

Farm Boys and Girls. By William A. McKeever. Macmillan. $1.50.

Ravenel's Road Primer for School Children. By Samuel W. Ravenel. Chicago: A. C. McClurg & Co. $1

Applied Biology. By Maurice A. Bigelow and Anna N. Bigelow. Macmillan. $1.40.

Practical Course in Botany. By E. F. Andrews and Francis E. Lloyd. American Book. $1.25. With a Flora, $1.50.

Elementary Plant Biology. By James Edward Peabody and Arthur Ellsworth Hunt. Macmillan. 75 cents.

Manual of Experimental Botany. By Frank Owen Payne. American Book. 75 cents.

Nature Stories. By Mary Gardner. Macmillan. 40 cents.

A Book on Birds. By Augustus Wight Bomberger. Phila.: John C. Winston Co. $1

Handbook of Health. Book Two. By Woods Hutchinson. Boston: Houghton, Mifflin. 65 cents.

Essentials of Health. By John Calvin Willis. American Book. 40 cents.

Elementary Physiology. By John Calvin Willis. American Book. 80 cents.

Health Culture Readers. Nos. One and Two. By the Author of "Preston Papers." New York: New Education Co. 60 cents.

Talks About Ourselves. By Kathleen Falmouth. New York: Dutton. 60 cents.

COLUMBUS

Portrait by Sebastian del Piombo in Metropolitan Museum, New York.
From Moore's "The Story of Christopher Columbus" (Houghton, Mifflin)

One of the most readable biological books of the last year is Thomson's *Biology of the Seasons.* The attractive colored illustrations are quite unusual, and the essays included are as charming as they are varied. Young things, tadpoles, caterpillars, rhythms in plant life, autumn fruits, and problems of migration are the titles of some of the chapters that are usually a rare combination of unexpected biological references, interesting experiment, theoretical discussion, and broad generalizations. It is not intended for the classroom, but is good for the library. Wholly readable, tho more technical in style, is Campbell's *Plant Life and Evolution.* The ten chapters discuss interestingly such subjects as land plants, seed plants, plant distribution, theories of evolution, human factors in evolution, origin of species, evolution and significance of sex; the treatment is broad, and from the standpoint of life or living things as well as of evolution.

Van Slyke's *Fertilizers and Crops* will be found a complete reference book and guide for the scientific farmer, and valuable to the many teachers of botany and agriculture who lack practical knowledge of plant and soil relations. Soils, fertilizers, their selection, and specific results are the main divisions to be found in its 700 odd pages. A wide range of useful information is included, *e. g.*, grasses for lawns, crop rotation for beets, and bacterial enrichment of soils. McKeever's *Farm Boys and Girls* contains much parental advice worth reading (and following) by any father and mother. Much needed is the chapter on the conservation of the farmer's wife. Few farmers have thoughtfully considered the amount of work best for their growing boys and girls, the right of the child to an *home* interest, and the importance to both boys and girls of the business training possible while still on the farm. The list of references is full

and varied. While there is little room in the curriculum of the usual elementary school for the study of roads, most boys will be interested in Rāvenel's *Road Primer,* with its series of practical questions *with answers* concluding each chapter. It will prove of interest to most of our young bicycle and motor enthusiasts.

Among the newer books definitely designed as textbooks none fills a greater need than Bigelow's *Applied Biology.* For the first time we have a textbook for the high school in which the botany, zoology and physiology are truly correlated. We have here not three booklets on the several subjects, but a unified whole. It is gratifying to know that the book has met the recognition it deserves and that a second edition has already been demanded. A teachers' manual is about ready. Among the many good points are the brief yet really comprehensive treatment of such subjects as yeasts and bacteria, the elimination of a few hundred time-honored college-borrowed technical terms, and the recognition of a golden mean with regard to experimental work; this re-establishment of the *demonstration* and the relegation of many class experiments to the teacher's table forms a marked contrast to several of the recent textbooks.

Occasionally a book fulfils the publisher's claims. This is the case with Andrew's *Practical Course in Botany* (with editorial revision by Francis E. Lloyd), which is a great improvement in every way over Andrew's earlier high school textbook. The practical questions at the end of each chapter are fortunately retained and enlarged. This is also published with a flora of 350 additional pages at an astonishingly low price. It contains a key based on structure, not flower color, which even high schools can learn to use. A third high school textbook in biology is *Elementary Plant Biology,* by Peabody and Hunt. Evidently designed primarily to fit the requirements of the New York City high school curriculum, it is dedicated to Martha Freeman Goddard, a former well-known teacher in that city. The laboratory work is very definite, designed apparently as directions for the notebooks. The matter included is well adapted to the first year of the high school. Non-flowering plants are dismissed too sum-

THE FIRST SAILOR
From Burr's "Around the Fire" (Association Press)

marily, it would seem, and one or two of the suggested reference books might be replaced by better ones, *e. g.*, Roger's "Tree Book" by Hough's "Handbook of the Trees." Payne's *Manual of Experimental Botany* is an attempt to teach all botany by experiments only. In this impossible task the author is hampered by a poor system of naming the illustrations included and by incomplete and sometimes misleading statements of the 228 problems into which he has divided the subject of botany.

Mary Gardner's *Nature Stories* is evidently designed as a supplementary reader. The type is good. The references to nature are slight; a plant or animal forms an introduction to a story of imaginative type, chiefly of a fairy or mythological character. There is, however, no distortion of natural laws such as often occurs in such stories, and, except for a possible misconception regarding fall coloration, the book is safe reading.

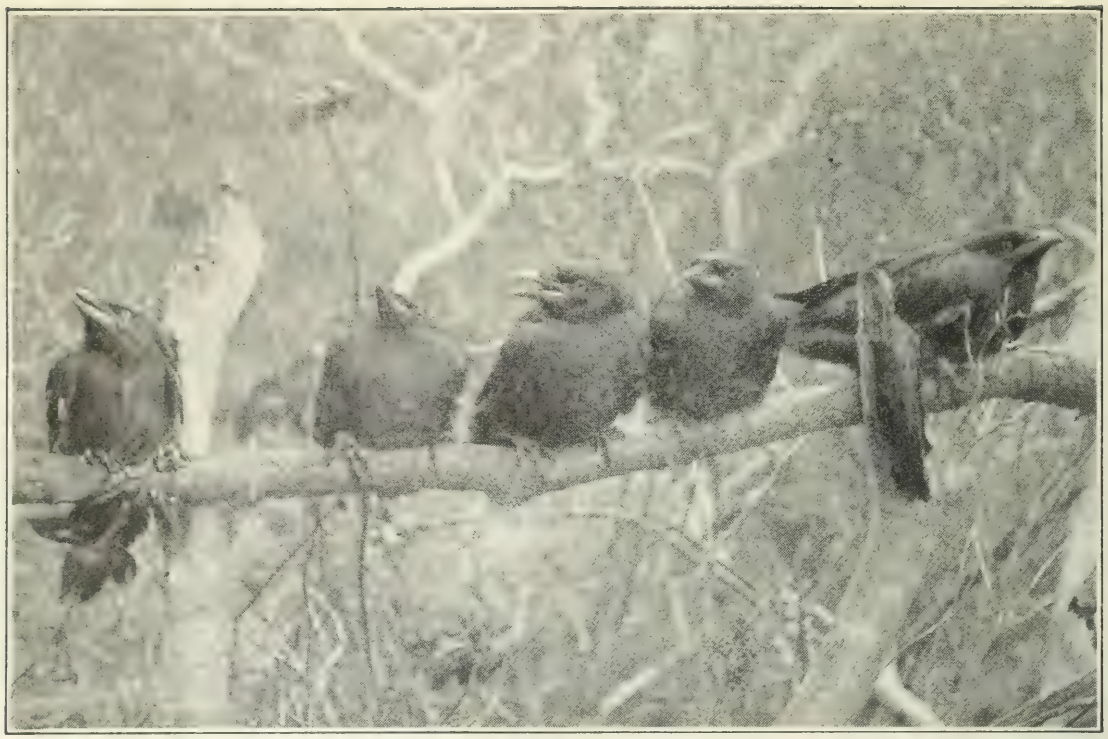
Bomberger's *Book on Birds* is a collection of essays and poems designed, the author says, "to arouse and inspire, rather than instruct." It contains several photographs of birds and their nests. The "key" is more a selection of helpful "earmarks" than a definite key.

The second of the Woods Hutchinson Health Series is a *Handbook of Health.* Many of the illustrations do not aid materially in explaining the text; they may, however, attract the casual reader, for whom the book is apparently designed. The rules of hygiene, etc., are usually good. The many elementary physiologies on the market owe their existence to the compulsory physiology-temperance instruction law. Some are fairly good; there is at this late date little room for a primary book (*Essentials of Health,* by Willis) which *begins* with a discussion of the cell, and includes nearly twenty Latin names of muscles (*e. g., gastrocnemius*), their classification as radiate, fusiform, and sphincter, and the use of such technical expressions as "chronic ulcerative consumption" and "ophthalmia neonatorum." *Talks About Ourselves,* by Kathleen Falmouth, is an English book, without date and index, and the type of book one met a generation ago. There is little need to protest against its introduction into American schools.

Geography

High School Geography. Parts I and II. Physical and Economic. By Charles Redway Dryer. American Book. $1.20.

Commercial and Industrial Geography. By Albert Galloway Keller and Avard Longley Bishop. Ginn. $1.



Rabenort's Geography. North and South America. Europe. By William Rabenort. American Book. 50 cents each.

Home Life in All Lands. By Charles Morris. *Book III. Animal Friends and Helpers.* Lippincott. 60 cents.

Europe and Its People. By Will S. Monroe and Anna Buckbee. Harper. 40 cents.

Meteorology. By Willis Isbister Milham. Macmillan. $4.50.

How are the mighty fallen! There is not a book in the bunch that would afford the necessary shelter for eating an apple, hardly even could one be safe in the reading of a detective story. School supervision is an easier matter now that mapmakers have discovered that clearness is not dependent upon size. In Dryer's *High School Geography* the maps are very neatly printed and the early introduction of the pupil to the use of contours is especially commendable. The illustrations are small and pertinent. Particular attention is paid to distribution of plant and animal life and its relation to mankind .The *Commercial and Industrial Geography* of Keller and Bishop opens appropriately with a color plate of a ship lading. It is designed for early high school or later grammar grades. The regional arrangement common to the older geographies is discarded in favor of a division according to the three great needs of man, Food, Clothing and Shelter, and under each of these headings the sources, preparation and transportation of the material is described. There are few maps, but plenty of pictures. Rabenort's *Geographies* are intended for still younger pupils than the preceding. The colored maps are neatly printed; the half tones not so well. The volume on North and South America (exclusive of the United States) devotes large space to a much needed account of that wonderful country, Western Canada. It is hard luck that a book dated 1912 should have the boundaries of Manitoba and Ontario wrong, but the publishers could not be expected to know in advance that these provinces were to be let in to Hudson Bay. The third book of Morris's *Home Life in All Lands* is a geographical reader, devoted chiefly to domestic animals and birds. *Europe and Its People,*

YOUNG CROWS
From Bomberger's "Book on Birds" (Winston)

like its predecessor, "Our Country and Its People," is designed for reading in the fourth school year. Its pictures are fewer but better than any of the above mentioned.

Milham's *Meteorology* may well be mentioned here, since the subject is embraced in physical geography, but it belongs in quite a different class from the others, for it is an elaborate treatise on the subject, the outgrowth of a junior and senior elective course at Williams College for the last eight years, making a large volume of 550 pages, supplemented by 34 weather charts. Numerous cuts, diagrams and charts are scattered thru the text, and each chapter is provided with lists of questions, topics for investigation, practical exercises and abundant reading references.

History

American Beginnings in Europe. By Wilbur F. Gordy. Scribner's. 75 cents.

Introductory American History. By Henry Eldridge Bourne and Elbert Jay Benton. Heath. 60 cents.

Story of Europe. By Samuel Bannister Harding and Margaret Snodgrass. Chicago: Scott, Foresman. 60 cents.

European Beginnings of American History. By Alice M. Atkinson. Ginn. $1.

In Oldest England. By George Philip Krapp. Longmans, Green. 60 cents.

Patriots and Tyrants. By Marion Florence Lansing. Ginn. 40 cents.

Story of Christopher Columbus. By Charles W. Moores. Houghton, Mifflin. 75 cents.

History of the United States for Grammar Schools. By Reuben Gold Thwaites and Calvin Noyes Kendall. Houghton, Mifflin. $1.

Boys' Parkman. Selections from the Historical Works of Francis Parkman. Compiled by Louise S. Hasbrouck. Little, Brown. 60 cents.

American History Story-Book. By Albert F. Blaisdell and Francis K. Ball. Little, Brown. 75 cents.

History of the Ancient World. By George Stephen Goodspeed, William Scott Ferguson and Stillman Percy and Robert Chadwick. Scribner's. $1.50.

History of the Ancient World. By George Willis Botsford. Macmillan. $1.50.

Short History of Europe. By Charles Sanford Terry. Dutton. $1.25.

Leading Facts of English History. By D. H. Montgomery. Ginn. $1.20.

The Rise of the Modern Spirit in Europe. By George S. Butz. Boston: Sherman, French. $1.25.

In glancing over the list of historical books which have come from the press during the past year one cannot help being imprest with the fact that it is the decree of the Committee of Eight of the American Historical Association, rather than Clio, that has induced most of the feverish activity on the part of authors and publishers. That august tribunal of censorship has declared that American history should comprise a continuous course running thru grades six, seven and eight, with an introductory study of such European beginnings as may appear necessary to afford the proper background. This call for an introductory study has met with a speedy response, and it must be admitted that no little ingenuity has been expended in planning

the new crop of books. Mr. W. F. Gordy begins with Athens and ends with Jamestown; and attempts to measure what we have learned and gained from the several nations and epochs that have gone before. His volume is a sort of an outline of European history down to the sixteenth century in the form of a series of striking narratives and pictures well calculated to fix the mind of the child to whom it is addrest. The maps and illustrations are well chosen. Professors Bourne and Benton cover the same period which Gordy surveys, and in an entertaining manner show how such contributions as Ionic columns, jury trial, representative government, printing presses and missionaries have been made to American civilization. There are good stories of the explorations, and, of course, a picture of De Soto's burial in the Mississippi. Professor Harding and Miss Snodgrass have also followed along the same path from Greece to Jamestown, with varying emphasis and an obviously more serious purpose. Certainly it would be a dull teacher who could not capture the imagination of the children in a talk about the people and labors of the nations here described. Miss Atkinson, alone among those who have answered the publishers' Macedonian call, has chosen another way of rubbing in the background of American history—by laying stress on England down to the age of the Elizabethan seamen. It is true, the Greeks and Romans figure in these pages, but quite wisely she shows our deep debt in literature, faith, institutions and culture generally to the English people. All those old institutions—Church, feudalism, serfdom and medieval town life—which, teachers hold, children should know something about, are here illustrated by references to England principally. The simple typography and smaller number of illustrations will also commend this volume to teachers who are pained at the profuse collateral decorations which encumber most elementary texts. These formal manuals may well be supplemented by Professor Krapp's delightful tales about early England: St. Augustine, the Venerable Bede, Alfred the Great, and Abbot of Glastonbury, and Company; and also by Miss Lansing's stories of King Marbod, Charlemagne, Frederick Barbarossa, King John, Simon de Montford, Robert Bruce and Joan of Arc—all of which are told "from the point of view of the contribution of the Middle Ages to the world today." To these lighter narratives may well be added Charles W. Moores's admirable life of Columbus, which combines in a happy manner historical research and vivid narrative. To the regular grammar school texts of United States history there is now added a new book by two eminent authorities, Dr. Thwaites and Dr. Kendall. Tho not a radical departure from our conventional manuals, this newcomer has many features to commend it—the suppression of useless details and the emphasis on the westward movement and the industrial revolution. It is none the less distressing to see that the authors have preserved the sacred proportions—one hundred and fifty pages to the colonial period and seventy-five to the epoch since the Civil War. To this text may be added for the school library two books in lighter vein: Miss Hasbrouck's judicious selections from the historical works of Francis Parkman, arranged in chronological order, and Blaisdell and Ball's simple and well-told stories of heroic American deeds during the colonial and revolutionary periods and the early days of the republic. Ancient history is more than fortunate in two texts of high scholarship and commendable pedagogical arrangement — Goodspeed's and Botsford's volumes on the ancient world. The former is a revision of the original manual (published about ten years ago) by Professor Ferguson and Mr. Chadwick who have brought the book down to date in learning and thrown the matured constitutions and significant periods into bolder relief by the elimination of much political detail. Altho the black and red maps are atrocious, the volume as a whole is strengthened and started on a new career of usefulness. Professor Botsford, fresh from his epoch-making work on Roman assemblies and from another trip to Mediterranean regions, has just published a revision of his *Ancient History* to comply with the school demand for a text covering the history of the world

down to Charlemagne. Like all of Professor Botsford's works, this combines sound scholarship, excellent topical arrangements, and a fine sense of proportion. For the later period, from the fall of the Eastern Empire to the opening of the nineteenth century, we have a new manual by Prof. Charles S. Terry, which is not wanting in style, altho it is in reality a compendium of political facts, useful for occasional reference or a first aid to a pupil cramming for an examination. Brevity and conciseness are its great virtues. In English history, we have a thoro revision of Montgomery's leading facts, which has saved the life of many a lad shipwrecked on entrance examinations. To the arid waste of texts, Dr. Butz's study of the social, scientific and literary aspects of the pre-Reformation age comes as a welcome relief. Altho it represents the Protestant view and overemphasizes the "enlightenment" that just preceded the Reformation, teachers will find it suggestive and informing. They will do well, however, to temper such phrases as "the glad refrain of the emancipated human spirit, the jubilant proclamation of the triumph of liberty," which the author uses to decorate his pages, by occasional reference to the facts about the condition of the peasants in Germany, where the refrain was the loudest and to the glorious deeds of the mighty King Hal, who, by the way, was not celebrated for his contribution to the triumph of liberty.

Education

Cyclopedia of Education. Edited by Paul Monroe. In five volumes. Vol. II. Chu-Fus. Macmillan $5.

Evolution of Educational Theory. By John Adams. Macmillan. $2.75.

Outline of a Course in the Philosophy of Education. By John Angus MacVannel. Macmillan. 90 cents.

The School. By J. J. Findlay. New York: Holt & Co. 50 cents.

Education. A First Book. By Edward L. Thorndike. Macmillan. $1.25.

Genetic Philosophy of Education. By G. E. Partridge. New York: Sturgis & Walton. $1.50.

The Learning Process. By Stephen Sheldon Colvin. Macmillan. $1.25.

Experimental Pedagogy and the Psychology of the Child. By Ed. Claparède. Translated by Mary Louch and Henry Holman. Longmans, Green. $1.40.

Outlines of Educational Psychology. By William Henry Pyle. Baltimore: Warwick & York. $1.25

The Individual in the Making. By E. A. Kirkpatrick. Boston: Houghton, Mifflin. $1.25.

The Rational Memory. By W. H. Groves. New York: Cosmopolitan Press. $1.35.

Psychology of Conduct. By H. H. Schroeder. Chicago: Row, Peterson & Co., $1.25.

Fundamental Facts for the Teacher. By Elmer Burritt Bryan. New York: Silver, Burdett. $1.

Chapters from Modern Psychology. By James Rowland Angell. Longmans, Green. $1.35.

Social Aspects of Education. By Irving King. Macmillan. $1.60.

The School in the Home. By A. A. Berle. New York: Moffat, Yard. $1.

New Demands in Education. By James Phinney Munroe. Doubleday. $1.25.

Riverside Educational Monographs. Edited by Henry Suzzallo. *Teaching of Primary Arithmetic.* By Henry Suzzallo. 50 cents. *Status of the Teacher.* By Arthur C. Perry, Jr. 35 cents. *Vocational Guidance of Youth.* By Meyer Bloomfield. 60 cents. Boston: Houghton, Mifflin.

Outlines of School Administration. By Arthur C. Perry, Jr. Macmillan. $1.40.

American Secondary School and Some of Its Problems. By Julius Sachs. Macmillan. $1.10.

Montessori Method. By Maria Montessori. Translated from the Italian by Anne E. George. New York: F. A. Stokes Co. $1.75.

The Normal Child and Primary Education. By Arnold L. Gesell and Beatrice Chandler Gesell. Ginn. $1.25.

Agricultural Education in the Public Schools. By Benjamin Marshall Davis. Chicago: University of Chicago Press. $1.

Engineering as a Vocation. By Ernest McCullough. New York: David Williams Co. $1.

Thoughts on Education. Chosen from the Writings of Matthew Arnold. Edited by Leonard Huxley. Macmillan. $1.50.

The Century and the School and Other Educational Essays. By Frank Louis Soldan. Macmillan. $1.25.

Ideals and Essentials of Education. By William Wallace Stetson. Haverhill, Mass.: Chase Press. $1.50.

All the Children of All the People. A Study of the Attempt to Educate Everybody. By William Hawley Smith. Macmillan. $1.50.

Necessary Basis of the Teacher's Tenure. By Andrew Sloane Draper. Syracuse, N. Y.: C. W. Bardeen. 50 cents.

Rational Education. By Bruce Calvert. Griffith, Ind.: Open Road Press. 50 cents.

Outlines of the History of Education. By William B. Aspinwall. Macmillan. 80 cents.

The second volume of Professor Monroe's *Cyclopedia of Education* abundantly sustains the promise of the first, and assures us that when the work is complete we shall have in it an invaluable source of information on practically all matters concerning education. The range of topics is suggested by the first and last articles in the volume, the one being on "Church Attendance of Scholars" and the other on "Fusion," by Prof. C. H. Judd. The care which the editor has taken to secure contributions from the recognized authorities in the various fields gives the *Cyclopedia* a thoroly representative character.

In the field of general educational theory several books have appeared during the year, among which *The Evolution of Educational Theory,* by Prof. John Adams, is notable as a work of ripe scholarship. Professor Adams has endeavored to formulate the great central problems and attitudes in man's thought about education, and to describe and account for their evolution. He begins by defin-

ing 'The Nature and Scope of Educational Theory." Education is declared to be a 'bi-polar process" in which person consciously influences person, either by direct contact or thru the communication of knowledge. These distinctions serve to introduce the discussion of "The Data of Education." Here the author is concerned with the question of the relation of the learner or "educand" to the processes and agencies that educate. Heredity, the inheritance of acquired characteristics, social heredity, and the relation of childhood to education, are treated under this head. In the chapter on "The Historical Aspect of Educational Theory," Professor Adams advocates the view that there is a genuine science of the history of educational theory.

Professor MacVannel (*Outline of a Course in the Philosophy of Education*) has at last published in book form an outline of his sound, wholesome and illuminating treatment of the philosophy of education. It is "an attempt to indicate some of the important lines along which educational reconstruction at the present time seems to be converging, and to suggest a method for the organization of educational ideas. The point of view is dominantly that of the idealist, but the contributions of evolutionary theory, of pragmatism and of modern sociological thinking to educational theory are clearly recognized.

In his little book on *The School* Professor Findlay has given us a readable and fairly comprehensive, tho brief, survey of the origin, function and administrative control of this institution, its types, the character of its teachers, its pursuits and its corporate life. He also gives a sketch of the stages of growth in children. The book will be especially useful to the general reader and to the teacher who wishes to get an introductory survey of the field of education, altho its sanity and the wide knowledge of its author make its judgments and suggestions on various points well worth the attention of those versed in the study of this subject.

Professor Thorndike has intended his *Education* as an introductory book. It is that and more, for every chapter has much that will to most readers prove refreshingly original and suggestive. In the main the author is interested in the psychological and quantitative phase of educational investigation, and his sermon is everywhere, get the facts and state them with whatever accuracy statistical methods make possible. Among the newer investigations included in the book are the scale of merit in penmanship devised by Professor Thorndike himself, that of merit in English composition worked out by Professor Hillegas, the results of Dr. Stone's study of arithmetical abilities, those of Dr. Courtis on the same topic, a summary of the investigations regarding the elimination of pupils from school, and Dr. Coffman's study of the composition of the teaching population.

Dr. Partridge has summed up, under the title, *The Genetic Philosophy of Education,* an account of the educational views of President G. Stanley Hall. The work has the sanction of Dr. Hall himself, and many will welcome a chance to get in compact and authorized form the gist of the many volumes and special articles he has written. The author has striven to preserve a little of Dr. Hall's style and manner as well as his ideas.

When we pass to the field of educational psychology, we note a number of books which attempt to summarize in textbook form the present status of this subject. Among these *The Learning Process,* by Professor Colvin, has been, perhaps, most successful in the United States. The author takes the functional point of view in discussing consciousness, and treats successively "Instinct and Habit," "Sensation," "Perception," "Imagination," "Memory," "Association," "Transfer of Training," "Attention," "Interest," "Judgment and Reasoning." His discussion of these well-worn themes is enriched by much material obtained in comparatively recent investigations regarding the cultural and the educational significance of the mental powers concerned. Professor Hall's study of the perceptions of the child is supplemented by the results of Meumann and of a number of other German investigations on the same topic. The various experiments in reference to economy in memorizing are summarized. Stern's studies in regard to the testi

mony of children, the views of Jung and Freud on psycho-analysis, and the various investigations on formal discipline, receive attention from Professor Colvin. His book is, on account of these features, especially timely and useful.

Experimental Pedagogy, by Prof. Ed. Claparède, of Geneva University, offers a new title which many will hesitate to substitute for "educational psychology." The author is much interested in the analysis of the phases of child psychology and its applications to education. The earlier chapters of his book are devoted to a history of this science and a definition of its problems and methods. The main phases and factors in mental development are then outlined and the work concludes with an excellent summary of what is known about intellectual fatigue.

A briefer book, *The Outlines of Educational Psychology,* by Dr. Pyle, approaches the subject from the point of view of the instincts and their education, and concludes with an account of habit formation, memorizing and fatigue. It should prove a very useful introductory text in the subject.

Professor Kirkpatrick has in his book, *The Individual in the Making,* attempted, in contrast with his method in *The Fundamentals of Child Study,* to trace the development of the child's mind as a whole instead of discussing separately the various instincts and other phases of child life. The evolution of personality is traced from the original interests up thru a pre-social stage, when persons are not clearly differentiated from things, thru an imitative and socializing stage, an individualizing stage beginning at three years of age, a period of competitive socialization from the sixth to the twelfth year, a pubertal or transitional period, and later adolescence beginning at the eighteenth and ending at the twenty-fourth year. Professor Kirkpatrick's book is, as would be expected, replete with concrete data, and is a suggestive contribution to the study of child development. *The Rational Memory,* by W. H. Graves, gives some good advice regarding memorizing, but does not contribute anything new to our knowledge of the subject. Professor Schroeder's *Psychology of Conduct* is, as its complete title informs us, an application of the analysis of the leading motives in conduct to the problem of moral education. It shows a wide acquaintance with the history of philosophic opinion on its theme and constitutes an interesting and sane tho not especially original, treatment of the vexed subject of moral education. Another wholesome book dealing with character building is *Fundamental Facts for the Teacher,* by President Bryan, of Colgate University. Profesor Angell's *Chapters from Modern Psychology* consists of lectures delivered at Union College in 1911. In it he aims to familiarize a general tho educated audience with the "principal features of psychology today." Physiological, experimental, abnormal, individual, applied, social, animal, and genetic psychology are passed in review, and the problems of each are outlined in a clear and interesting manner with concrete illustrations of typical methods and results. To one who wishes to find out in a few pleasant hours what modern psychology is and does this book can unhesitatingly be recommended.

In his *Social Aspects of Education* Professor King has incorporated a number of extracts from the writings of prominent people of the day upon the social life of the school and its relation to home, to vocation, and to social life and progress in general. The extracts are presented with introductions, comment, and a list of further references on the various topics treated. The book should prove very useful in courses on social education. Professor Berle shows us in his *The School and the Home* how to organize the intercourse of the child with the parent in the home so as to gain, not only several years in the time usually devoted to attain certain educational results, but also to make these results more effective than they usually prove. He holds that "the waste in the average American child's life is something simply astounding" and that "American education is one of the most wasteful things in the whole American organization." The reader of Professor Berle's book must conclude that "efficiency engineering" has an inviting field in home education, altho many will continue to wonder whether in the long run the subjects of

such culture as our author and Dr. Sidis advocate will profit as much as their early rapid progress suggests. Another valuable discussion of the theme of educational efficiency is Mr. James Phinney Munroe's *New Demands in Education.* He finds our schools prone to cram the mind with uninteresting, unrelated, and useless facts, instead of studying the child with a view to developing health, rounding out character, advising about and training for a vocation, and preparing for appreciative and intelligent participation in social life.

The Riverside Series of Educational Monographs has added during the year *The Vocational Guidance of Youth,* by Meyer Bloomfield, director of the Vocation Bureau of Boston; *The Status of the Teacher,* by Dr. Arthur C. Perry, and *The Teaching of Primary Arithmetic,* by Professor Suzzallo. Mr. Bloomfield's book gives a convincing demonstration of the need of vocational guidance, together with valuable experience in regard to the best methods of affording it. Professor Suzzallo has presented in brief survey what is probably the best account we have of the aims, the tendencies and the methods in the teaching of elementary arithmetic. To this he has added critical comment that must make of his monograph an exceedingly valuable guide in the field. Dr. Perry points out the ambiguous and unsatisfactory nature of the position of the teacher and the need of better defining his authority and responsibility, and thus establishing more clearly his professional character.

The American Secondary School, by Professor Sachs, discusses the qualifications, the personality and the methods of the good secondary teacher, the history and present problems of public high schools and private secondary schools, and the question of the true function of secondary education. The book deals with very concrete details and is conservative in tone.

The public interested in the improvement of elementary education will welcome the authorized translation of Madame Montessori's book on *The Montessori Method.* This comprehensive account of the discipline, the didactic material, and the specific methods in use in the "Houses of Childhood" will be very useful even to those who have had the good fortune to observe in person Dr. Montessori's remarkable work. Another book that should prove valuable to the primary teacher is *The Normal Child and Primary Education,* by Professor and Mrs. Gesell. The authors have based their treatment of the pedagogy of the primary school on considerations drawn largely from biology and genetic psychology. The book is wholesome and suggestive.

Among the monographs on special phases of education that deserve attention are *Agricultural Education in the Public Schools,* by Professor Davis, and *Engineering as a Vocation,* by Ernest McCullough. The former work will prove a very useful reference book on what has been and is being done in the secondary and elementary schools in the field of instruction in agriculture. Mr. McCullough gives good advice to those who are thinking of becoming engineers or have already entered upon the training or practice of this profession. *Thoughts on Education,* from the writings of Matthew Arnold; *The Century and the School,* by Superintendent Soldan, and *Ideals and Essentials in Education,* by Superintendent Stetson, are collections of views and addresses that will prove of value to the educational biographer or historian. Mr. W. H. Smith's *All the Children of All the People* is a demand for a greater variety in educational methods to suit the infinite variety in individual capacity. Many of the author's ideas are sensible enough at bottom, but his earnestness leads him sometimes into extravagant statements.

Miscellaneous

King's Series in Woodwork and Carpentry. Constructive Carpentry, 70 cents. Inside Finishing, 80 cents. By Charles A. King. American Book.

Handbook of Home Economics. By Etta Proctor Flagg. Little, Brown. 75 cents.

Educational Needlecraft. By Margaret Swanson and Ann Macbeth. Longmans, Green. $1.35.

Eleanor Smith Music Course. By Eleanor Smith American Book. 30 cents.

Musical Dictation. Book I. By Hollis Dann. American Book. 50 cents.

Music Writing Book. To accompany Part I of Musical Dictation. By Hollis Dann. American Book 10 cents.

Songs We Like to Sing. Compiled and Edited by Birdie Alexander. Silver, Burdett. 35 cents.

THE TOWER OF KNOWLEDGE

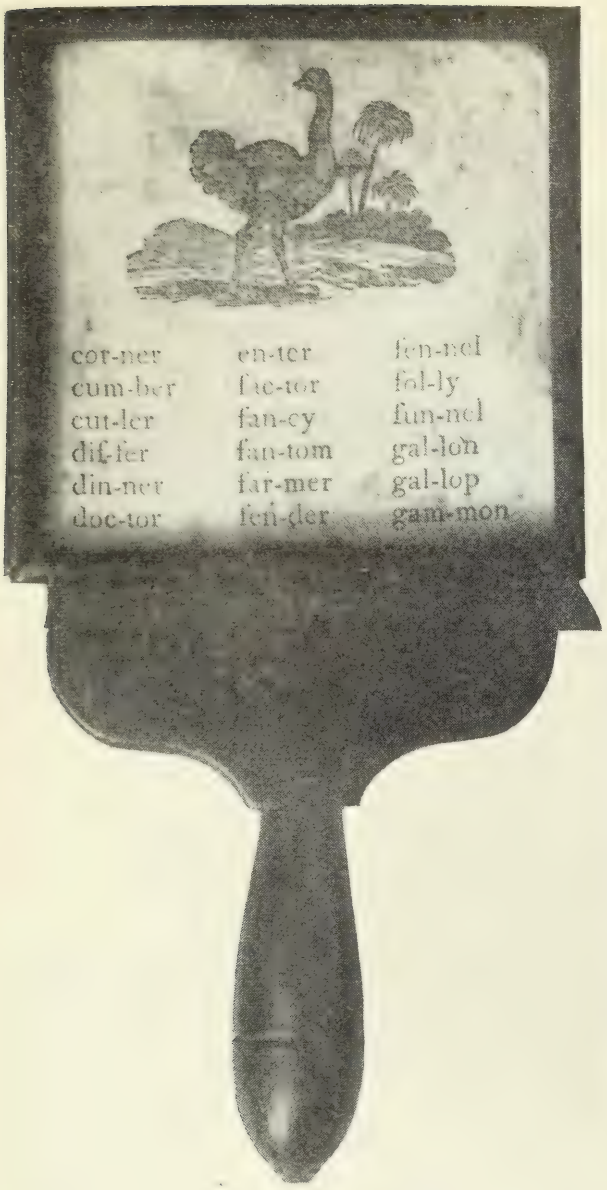
Horn Books

BY GEORGE A. PLIMPTON

[Mr. Plimpton, of the firm of Ginn & Co., school book publishers, has the largest and most complete collection of early school books, including manuscripts and printed volumes, in the world. It embraces all the various branches of education. We have asked Mr. Plimpton to write a short article on horn books, of which he has twenty-two, more thar there are in any other collection. Of the five horn books which have been found in America Mr. Plimpton owns three.—EDITOR.]

THE foundation of all knowledge is the ability to read. What can be more interesting than to trace out the history of the successive tools which have been used for the teaching of reading?

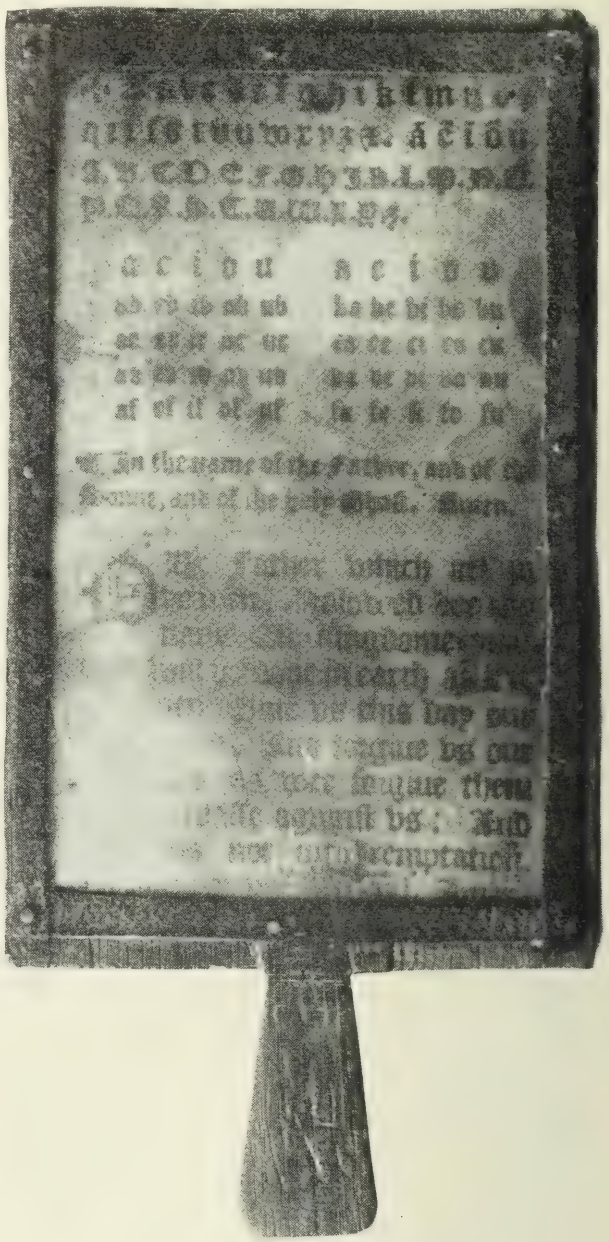
At the present time there are two clearly defined methods of teaching a child to read—the "phonic method" and the "word method," one emphasizing sound and the other emphasizing sense. Before printing was invented, in the days when education was entirely in the hands of the religious orders and all schools were connected with some monastery or abbey or cathedral, the monks probably



did not concern themselves seriously as to which method was the better, pedagogically, but the plan they followed was more nearly akin to the "phonic method." A child was first drilled into a knowledge of the alphabet and the vowel sounds, and the earliest known instrument used by the teacher to impart this knowledge was the horn book.

In the manuscript known as the Margarita Philosophica (1504) is this quaint illustration of the Tower of Knowledge. The accompanying illustration shows that Dame Wisdom with a horn book in her hand points to the eager (?) schoolboy the tower of knowledge which he is about to enter, where he will learn the parts of speech under Donatus, the famous teacher of the fourth century; grammar under Priscian, arithmetic under Boetius (who was called "the last of the noble Romans"), rhetoric under Cicero, logic under Aristotle, astronomy under Ptolemy, geometry under Euclid, music under Pythagoras—thus acquiring the three language studies and the four sciences, called the "trivium" and the "quadrivium." Mounting still higher in the tower, he will learn moral philosophy under Seneca and natural philosophy under Pliny, finally climbing to the hights of theology under Peter Lombard, and in the hands of the dame is the key of the tower—the *horn book* giving the Roman alphabet.

Now a horn book is not a book at all. It was usually made of wood with a handle—shaped so like the battledoor of the old game of battledoor and shuttlecock that it was frequently called "the battledoor book." Attached to the face of the horn book was the vellum of paper upon which the lesson was inscribed, protected by a sheet of translucent horn. In the days when manuscripts had to be copied with infinite care and were the prized possessions of the few, it was of course necessary that the lesson should be protected from the possible stain of a pair of dirty little fingers as it was passed about from child to child. Altho there was considerable variety in the horn book les-



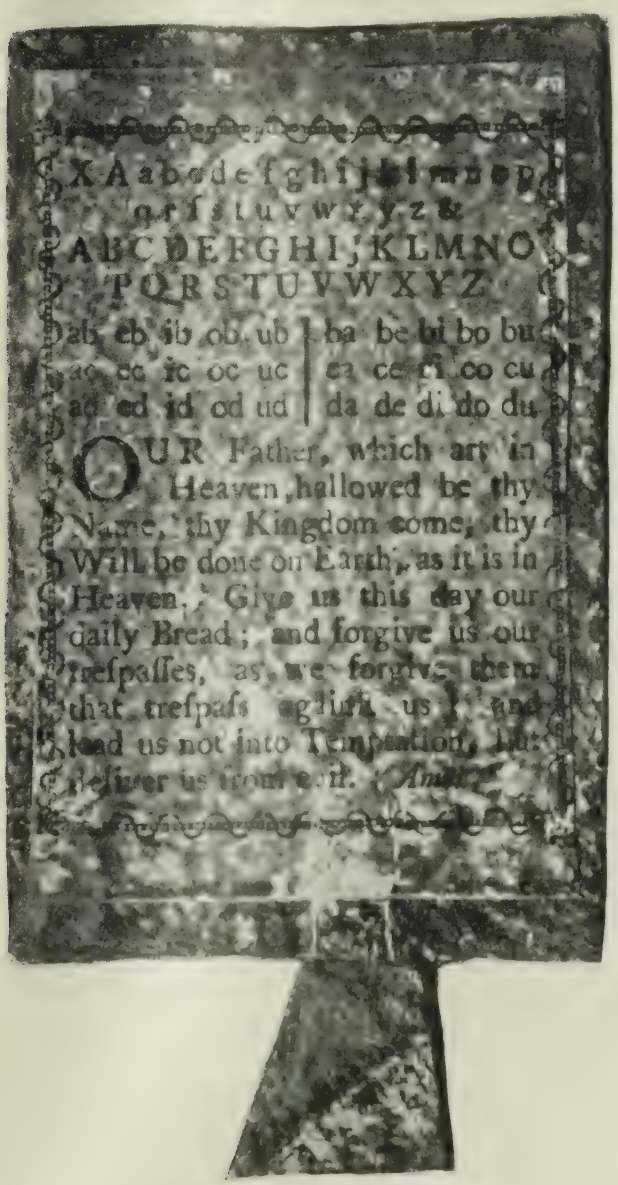
BATTLEDOOR BOOK

PRINCETON HORN BOOK

sons, some having the numerals and others the alphabet in script as well as in print—the majority of horn books followed the same order. Even when the A-B-C book began gradually to supersede the horn book, its first page was identical with the conventional horn book. This was the order: First the Greek cross, then the alphabet, next the vowel sounds, and finally the Exorcism and the Lord's Prayer. The top row of the horn book which commenced with the cross was called "the criss-cross row," and the pupil was expected to cross himself when he commenced his lesson. As for the exorcism, the idea evidently prevailed in that benighted age that the average boy was so "full of the devil" that he needed the proper formula constantly at hand to free him from Satan's wiles.

The horn book was undoubtedly used as early as the beginning of the fifteenth century. In the arithmetical manuscript of Sacrobosco dated about 1400, which

HORN BOOK OF ABOUT 1600

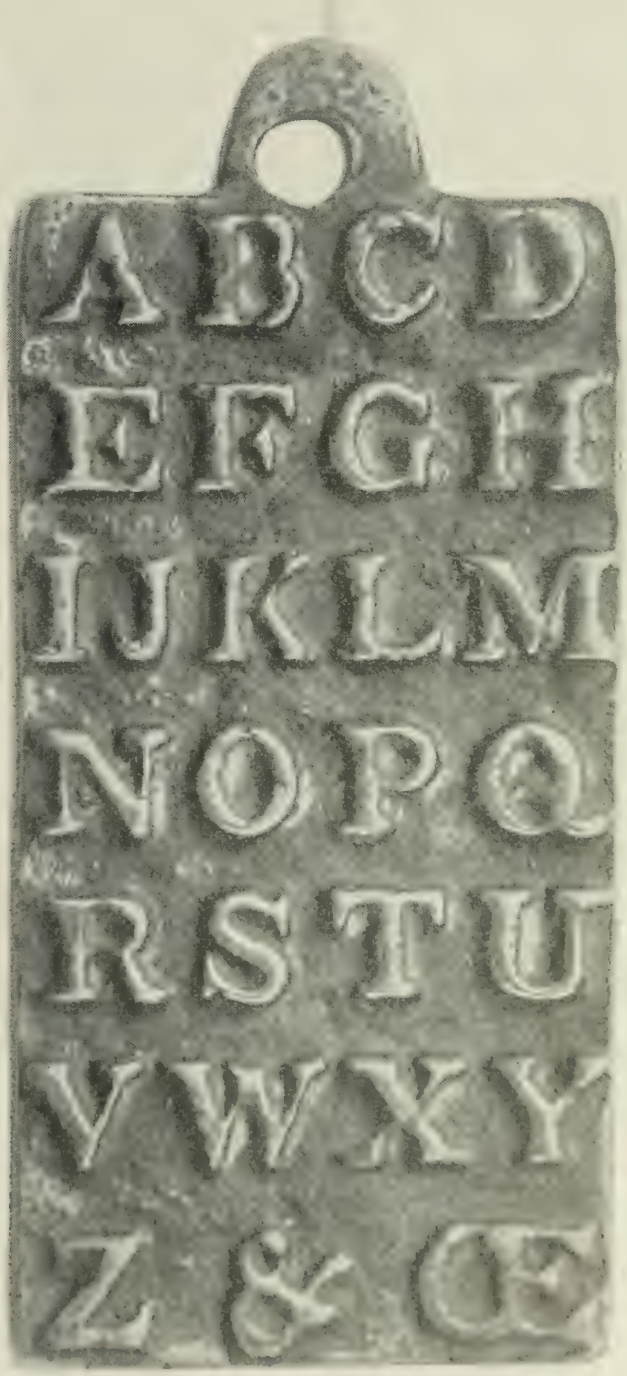


is in my library, antedating by a century the Margarita Philosophica, we come unexpectedly upon the picture of a horn book. Tired of the monotony of his mathematical copying, the monk has sought recreation from Sacrobosco by drawing a schoolroom. Here we can plainly see not only the schoolmaster in his gown, but the horn book which he holds in his hand and even the Arabic numerals upon it.

It is rather remarkable that so few original horn books are extant. The British Museum has only three, the

Bodelian Library at Oxford has one and Mr. J. Pierpont Morgan has one. Few examples have been found upon the continent of Europe none that I know of with the horn covering. The best specimens have been found in England—one of Shakespeare's time reminding us of the quotation in "Love's Labor Lost" (Act IV),

"Yes, yes, he teaches boys the Hornebook.
What is ab spelled backward with the horn on its head?"



A novel horn book of 1664 is made of leather and decorated with a representation of Charles II on horseback.

CARDBOARD HORN BOOK

Altho horn books, properly speaking, were made of board with the horn covering, there were "horn books" made of ivory, of copper, of brass and even of leather,—all having the same general battledoor shape. In Mexico one has been discovered made entirely of wood, the painted illustration representing the Holy Child Jesus holding up a globe surmounted by a cross. This has also the alphabet preceded by another cross. This curious horn book was probably made early in the 17th century.

Besides the Mexican horn book, I know of but four original horn books which have been found in America. One is in the Historical Library of Guilford, Connecticut. An interesting ivory horn book was purchased in Boston, two years ago, the early history of which is

COPPER HORN BOOK, 1729

not known, but it is undoubtedly a relic of the schools of colonial New England. This has the numerals, the alphabet in print, both the large and small letters, and in script. A New York family have an interesting ivory horn book which has been handed down for several generations. The last horn book made in America, if not in the world, was probably the one picked up at Princeton, New Jersey,—a sort of sporadic survival, for it is dated early in the nineteenth century. This has a sort of modern improvement in the shape of a wooden slide by means of which various lessons could be inserted under the horn.

Down thru the centuries the horn book became modified in form, finally losing its handle. Gradually as paper cheapened and printing made books accessible, cardboard A-B-C's took the place of the horn book, and then the "battledoor book," an outgrowth equally obvious of the horn book, was invented by John Newbury, an Englishman, in 1746.

New York City.

What More Can the Higher Education Do for America?

BY CHARLES F. THWING, LL.D.

President of Western Reserve University and Adelbert College.

IN a pregnant but little known passage, Matthew Arnold remarks that the powers which contribute to build up human civilization are "the power of conduct, the power of intellect and knowledge, the power of beauty, the power of social life and manners. Expansion, conduct, science, beauty, manners—here are the conditions of civilization, the claimants which man must satisfy before he can be humanized." In the more than thirty years which have elapsed since these words were written in the preface to "Mixed Essays," the "power of intellect and knowledge" as a force contributing to the building up of civilization has vastly increased, until at the present time it would, I suppose, be generally acknowledged that the power of education, standing for intellect and knowledge, has become the greatest force in civilization. For us in America it remains to make this force of still greater worth, and especially does it belong to us to give to the higher education, so called, a still greater degree of efficiency. For American life cannot be made too rich or too noble, too broad, or high, or deep.

The higher education can do more for American life thru an endeavor of the colleges to care more carefully for the individual student. The college should individualize each man. The increase in the number of students in the colleges has resulted in the mass and not the man becoming the chief object concerned. The colleges, like the public schools, have been and are in danger of losing that fundamental principle of education lying in the remark, "He calleth His own sheep by name, and leadeth them out."

In the former time, in America, as Bishop Welldon recently declared in an address before the British Association, as in England, it was true that "the practical insight by which a teacher discerned and the sympathy by which he or she encouraged the signs of genius or talent, was of constant worth." But at the present time, in both countries, the peril is that the teacher will not be able to discriminate the evidences of special power, or the promise of distinction in students.

In order for the college properly to individualize the student, three methods are available.

One method lies in limiting the number of students. Certain colleges have at times promised themselves and the people that such a limitation was about to be made. But few, however, have consistently held to this determination. Among all the colleges, Vassar has firm-

ly held for some six years to the purpose of limiting her numbers to one thousand. A second method lies in increasing the number of teachers, especially the teachers who naturally come into close personal association with the students. The Princeton method of tutors represents the most outstanding example of this practice. Undoubtedly the tutorial system has been of great advantage to the historic college of New Jersey, and also has had much influence over the higher education in the United States in making plain the value of personal relationship. The Harvard system of advisers, of older origin but less conspicuous influence, is also an attempt to bring the teacher and the pupil into some sort of helpful relationship. But this method has not proved to be of the worth with which it was first accredited. It is a success in the matter of routine and of defined obligation. Beyond that, in the intellectual realm, on account of a lack of basis for companionship between most men and their advisers, the latter exert very little influence.

It is certainly true that the number of teachers in the American college, as in the American public school, should be multiplied by two, in order to give proper individual training to each man.

A third method for securing this great result of individualizing lies in laying great emphasis upon the idea of the worth of the personal influence of the teacher. Let there indeed be no depreciation of scholarship, superficiality or laxity at this point is fundamentally weakening. Let teachers be selected, also, for their inspiring and formative influence over students. The problem is by no means simple nor its solution easy, for there are not enough of such men born in the world. Edward Bowens are not found often, even at Harrow! But a proper recognition of the need goes a vast way toward its filling. One can well keep before one's self what Dr. Arnold once wrote of the teacher he desired:

"What I want is a man who is a Christian and a gentleman, an active man, and one who has common sense and understands boys. I do not so much care about scholarship, as he will have immediately under him the lowest forms in the school; but yet, on second thought, I do care about it very much, because his pupils may be in the highest forms; and besides, I think that even the elements are best taught by a man who has a thoro knowledge of the matter. However, if one must give way, I prefer activity of mind and an interest in his work, to high scholarship; for the one may be acquired far more easily than the other."

The higher education can also do more for American life by raising the standards of intellectual work among students. The intellectual life of the college has not improved in the last generation. Students know more; they think less. They are more men of the world, less men of the book. Interests athletic, fraternal, dramatic, social, journalistic, consume both time and strength. Their affairs have become more diversified and their attention more dissipated. Things scholastic have less compulsion. The significance of this academic condition becomes more impressive when it is compared with the intellectual life of the professional school. In the school of medicine or of law, intellectual enthusiasm and quickening labor abound. The professional student finds that he has a mind, and he finds the use of it a very interesting process. The causes of this intellectual decline are manifold. One cause lies in the fact that our generation is materialistic in its ordinary conceptions and ideals. In its deepest convictions the generation is nobly idealistic. But in its workaday purposes and atmosphere it is concerned with the lust of the flesh, the lust of the eyes and the pride of life. With such conceptions the college world is sympathetic. The extra-mural and the intra-mural world are essentially one. The idols of the market place are set up in academic chapels. This materialistic mood manifests itself in many conditions, and also in one particular form. This particular form lies in the number of college men who enter business. The change in the popularity of different vocations selected by graduates is impressive. In the seventeenth and eighteenth centuries in America, the ministry was chosen by the larger number. The ministry was, in the last century, supplanted by the law. In the last two decades, the law, in turn, has been supplanted by business. Now, the simple fact is, that business is more of an executive, administrative affair, and less

an intellectual concern, than either the legal or the medical calling. Therefore, college men proposing to enter business life are less inclined to live laborious intellectual lives. Such a mercantile or commercial purpose tends to lower the level of intellectual academic standards.

I also am inclined to believe that the increasing liberty of the life of the student has had, in certain respects, a similar influence. Here one must at once discriminate. This enlargement of opportunity has resulted in ennobling the intellectual life of the men ablest and most thoughtful. It has allowed them to take a swifter pace, untrammeled by the slower walk of the majority. It has blessed the upper tenth, or upper fifth of every class. But for the other nine-tenths or four-fifths, the freedom has been interpreted as an opportunity for indulgence in concerns which no courtesy would allow one to call intellectual. Yet, despite this disadvantage, in affairs academic, as in affairs political, the abuse of liberty is not reason sufficient for doing away with it. The liberty in the choice of studies, under wise guidance and supervision, has saved the students from scholastic humdrum and the academic lockstep. It has developed scholarly individuality and individual scholarship. It has quickened men to think and to study for themselves and beyond themselves. It has shed light upon the whole field of knowledge, thru the light given by individual investigators in the separate parts of the boundless domain of truth.

It also should be said that the promotion of a simpler life on the part of students would quicken the life intellectual. Ages of luxury are no more periods of great intellectual achievement in the college than in society. Ours is an age of luxury without and it is also an age of luxury within college walls. For most college men, but not for all, by any manner of means, luxury does not stand for the life of thought or of thoughtfulness. I go into many college rooms which are rather clubrooms than studies. One likes to find a college room thoroly comfortable, but also one likes to find it deservedly interpreted by the word "study."

The athletic renaissance, too, is at once cause and result, sign and condition, of the intellectual decline. The proper adjustment of this movement would promote the intellectual interests. This revival is in many ways good, yet for some men it does subtract from the historic purposes of the college. Athletes are seldom, tho they are sometimes, first-rate scholars. They are usually good executives, and not a few of them eventuate in becoming great leaders in business undertakings. But most, nay, all, colleges do need to emphasize in this athletic age intellectual elements, intellectual values, intellectual foundations and intellectual achievements.

The colleges would also give to the American community service more efficient by seeking to train the exceptional man. The exceptional man is to humanity what the sport is among nature's plants. Like it, he may prove to be of value unspeakable. He should be sought out and cultivated with the utmost carefulness and faithfulness. The peril of democracy lies in not seeking and not finding the human sport. The democratic peril consists in a leveling down. In the year 1863, in the midst of the Civil War, John Stuart Mill wrote to Judge Appleton, saying:

> "I have long thought that the real ultimate danger of democracy was intellectual stagnation, and there is a very good side to anything which has made *that* impossible for at least a generation to come."

Six years after he wrote to James M. Barnard, of Boston, saying:

> "The great desideratum in America—and tho not quite in an equal degree, I may say in England too—is the improvement of the higher education. America surpasses all countries in the amount of mental cultivation which she has been able to make universal; but a high average level is not everything. There are wanted, I do not say a class, but a great number of persons of the highest degree of cultivation which the accumulated acquisitions of the human race make it possible to give them. For such persons, in a community that knows no distinction of ranks, civilization would rain down its influences on the remainder of society, and the higher faculties, having been highly cultivated in the more advanced part of the public, would give forth products and create an atmosphere that would produce a high average of the same faculties in a people so well prepared in point of general intelligence as the people of the United States."

These interpretations which this wise man, among the wisest of all men in the last fifty years, gives of American life,

are significant and impressive. They point out a special duty which the college, above every other agency, ought to perform for the democracy. Among assemblages of minds which are apparently so common and so commonplace, each alarmingly like the others, the college should seek out minds which are unique, individualistic, possessed of innate powers which, properly trained, might result in richest advantages to humanity. "What is your greatest discovery?" was asked Sir Humphrey Davy. "Michael Faraday," was his reply.

The colleges would furthermore be able to be of greater service to the commonwealth thru receiving heartier sympathy from parents, in their efforts for securing the more solid and enduring aims of education, and of life. The number of boys (of boys, greater than of girls) who come to college in order to enlarge their acquaintance, to raise themselves to a higher social plane, to have in their later youth a good time, is in some institutions, large, surprisingly large. Such ideas and ideals are not to suffer undue depreciation. Let us give full value to social acquaintances and standards, and to the good times. But be it said that these aims, or convictions, do not represent the fundamental elements of the higher education. Be it also said that the presence of men in any large numbers, guided by such purposes, prevents the college from surrounding its men of the sober temperament, and of highest idealism, with worthiest conditions and; also prevents such men of the serious type from securing the most effective and precious results in and from their education. The college, be it said, cannot go much faster than the students permit, and the students do not go much faster in their intellectual steppings than their parents require.

It would also prove, I think, to be of advantage to American life, were the college to make more clear and distinct its simple purpose to be of richest service to this life. Of course one knows well that such purpose is the constant and deep endeavor of the college. I would make the expression of this purpose even more constant and more emphatic. Let the keynote of every baccalaureate sermon be to do and to serve. Let college settlements be multiplied, and their associations with the colleges themselves made more intimate. Let the naturally selfward tendencies of the higher education in training the student be lessened or eliminated by definite altruistic work on the part of the student. Napoleon is reported to have said that "One of my grand objects was to render education accessible to everybody. I caused every institution to be formed upon a plan which offered instruction to the public either gratis or at a rate so moderate as not to be beyond the means of the peasant. The museums were thrown open to the whole people. All my efforts were directed to illuminate the mass of the nation." A similar purpose should more consistently prevail in the American college, and should be more strongly and always humbly exprest by the college.

CLEVELAND, OHIO.

The Turncoat

BY RALPH M. THOMSON

For a trifling mess of pottage,
  Fouled by execrable hands—
For the greed of smutty shekels
  In a politician's hands,
You forgot the proud traditions
  That your fathers gave of old;
You besmirched and hawked your birthright
  For a bag of filthy gold.

For a queasy mess of pottage,
  You have bartered self respect,
For a treasonable honor,
  You've betrayed your intellect,—
And while you may bray excuses
  For the traits that you pre-empt,
You have gained from decent people,
  And for evermore contempt!

SAVANNAH, GA.

The Emperor of Japan

BY HAMILTON HOLT

MANAGING EDITOR OF THE INDEPENDENT.

JIMMU, the first Emperor of Japan, ascended the throne ninety-seven years after Romulus founded the city of Rome, if we may accept Roman and Japanese traditions. From that day to this his descendants in unbroken succession have ruled over the Land of the Rising Sun. Mutsuhito, who died in the early morning of July 30, was the one hundred and twenty-first of the imperial line. He was born in Kyoto November 3, 1850, in a pretty villa, near the gate of a park adjoining the palace grounds and now within a stone's throw of Doshisha University, the greatest Christian institution of higher learning in the Far East. The house was pointed out to me when I was there last October, but visitors are not allowed to enter it.

THE EMPEROR.

It must be remembered that the Emperor's mother was not the Empress, and that is the reason he was not born at the palace. Mutsuhito spent a quiet boyhood at Kyoto. Not much is known to the outside world of his life there. At that time Japan was a hermit nation. No foreigner was permitted to enter the empire, no native to leave it, on pain of death. Then Commodore Perry opened up Japan to the world and the peaceful revolution began. By the time Mutsuhito ascended the throne, at the death of his father, Komei, in 1867, the Shogunate or military dictatorship was tottering. All the authority, power and glory of Japan was "restored" to the young Emperor. Then began a reign which in development, progress and achievement has probably never been paralleled in history. The old feudalism was broken up and a constitutional government along Western lines established; the caste system, almost as rigid as that prevailing in India today, was abolished, and the Samurai or warrior class laid down their arms, while an army and navy that now ranks with the greatest was built up. More important still, a system of universal education, based on American ideals, was introduced, while business, agriculture and all the arts and sciences were fostered by Government aid. So quickly and thoroly were these changes made that during the reign of Mutsuhito the whole political, social and economic system was completely changed, and Japan developed from an insignificant member of the sisterhood of nations into one of the five foremost world Powers, measured by any standard.

The figure of the man who has led the nation thru such an epoch, tho little known to his people, and still less to the outside world, is nevertheless the most beloved ruler on earth.

It is difficult to convey to the Western mind any adequate conception of the place the Emperor occupied in the affections of his people. Only an understanding of Japanese religion and family life

can furnish the key. Shintoism, the indigenous religion of Japan, has for its three cardinal tenets the worship of nature, heroes, and ancestors. Children worship their parents; all worship the Emperor as the supreme parent, and the Emperor worships his own ancestors. The degree of reverential awe with which he is still invested in these days of constitutional government and the introduction of Western materialism is as remarkable as it is genuine. When a schoolhouse is on fire, the teacher will save the picture of the Emperor before trying to save the pupils. A section superintendent will commit hari-kiri when a switch gets out of order and the Imperial train is delayed half an hour, and a youth will take poison, as was done last week in front of the palace gate, so the Emperor may live.

In his commentaries Prince Ito says:

"The Sacred Throne was established at the time the heaven and earth became separated. The Emperor in heaven descended, divine and sacred. He is pre-eminent above all his subjects. He must be reverenced and is inviolable. He has indeed to pay due respect to the law, but the law has no power to hold him accountable to it. Not only shall there be no irreverence for the Emperor's person, but also shall he not be made a topic for derogatory comment nor one for discussion."

This transcendentalism of the Emperor is not exactly analogous to the European theory of the divine right of kings, for the Emperor's authority and attributes do not proceed from on high. He is literally the State and as such incarnates all the national virtue and therefore calls forth a loyalty and patriotism in his subjects often stronger than the fear of death.

It was my great privilege last October to be presented to this man, who, tho the "Son of Heaven," voluntarily gave his people self-government without a revolution or even the slightest threat of pressure from below.

Our invitation came to us thru the American Embassy at Tokyo. Mr. Lindsay Russell and I were told to wear full evening dress, with white waistcoats and gloves, tho the ceremony was to take place at ten o'clock in the morning. Our wives were to wear high-neck reception dresses of any color but black. At 9.30 we assembled at the Embassy, and from there drove with the American Chargé and his wife, who were to introduce us, to the palace.

The palace is in the very heart of the city. It is surrounded by a moat and massive ramparts of stone, surmounting which are ancient and gnarled pines, which used to ambush the archers in feudal times. The palace originally belonged to the Shogun or military ruler of Japan, but since Tokyo, then called Yedo, was made the capital, it has been constantly used as the home of the Emperor. Before it is an extensive stretch of turf, which occupies the area between the second and third or inmost moat. We crossed the bridge that brought us to this space without being detained by the guards, the Embassy livery evidently being a sufficient passport. After passing thru the double hedge known as Nishi Bashi and driving for a minute or two thru the beautifully kept grounds, we arrived at the front entrance of the Imperial residence. The canon of Japanese architecture as well as art is the elegance of simplicity. Consequently we were not surprised to find the palace a very broad and long one-story building, furnished simply but in the most exquisite Japanese taste. Tho the ordinary Japanese home has no furniture, the palace was furnished in European style, tho the walls and ceilings of the rooms were Japanese. We were met at the door by liveried attendants, our wraps taken, and then we were ushered by the master of ceremonies and his aides along a red carpeted hallway of beautiful Japanese polished wood to the waiting room, furnished in European fashion. Promptly at the appointed second the ladies were taken to the audience room of the Empress, and Mr. Russell and I to that of the Emperor. The halls of all Japanese houses are next to the outer walls and the various rooms open into the halls. Consequently the halls are light and the rooms are dark. As we approached the dark threshold of the audience room we halted, and then, at the proper signal, Mr. Russell walked in with the Chargé. They gave us each the honor of a separate audience instead of having us both go in together. I had hardly time to look out of the window of the hall upon a lovely bit of typical Japanese garden landscape when I saw Mr. Russell

backing out of the room. The gentleman at my side whispered "Proceed."

As I entered the august presence I saw His Majesty standing in the center of a group of seven or eight men. He held his hand out toward me, as if he expected me to come forward and take it. I was coached, however, to make three low bows as I entered the room, one at the threshold, one at the middle of the room and one just before I shook his hand. So I resisted the impulse to go forward, but followed out my instructions as best I could, tho very awkwardly, I fear. I then took the hand of the Emperor. His Majesty was dressed in the uniform of a generalissimo. He was taller than the majority of his subjects, but he looked older than I expected, for the pictures of him with which the world is familiar were taken years ago, when he was a young man. His complexion is very dark, with drooping mandarin-like beard and mustache, his countenance somber and his mien impassive and austere. But no one could fail to be impressed with his penetrating eyes and his supreme and majestic dignity.

Without a smile of welcome, such as all Japanese usually employ at a greeting, he turned quietly to the gentleman on his right, Count Nogasaki, and asked in a low, quiet voice in Japanese, how long I had been in Japan. After this was translated to me and I had replied and it was translated again to the Emperor, he inquired if I had seen any enjoyable sights in Japan.

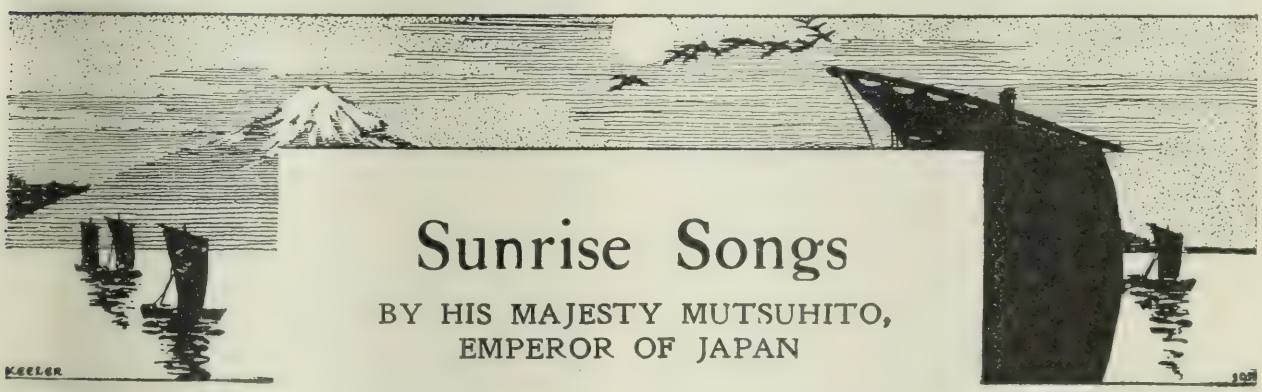
I replied that I had seen many. He then asked where I was going after I left Japan. And after he heard my reply he put out his hand again as a sign that the audience was ended. I shook it and then backed out of the room, bowing thrice, as when I entered. It seemed as if I had hardly been in his presence two minutes.

We were then conducted to the Empress's audience chamber, and went thru exactly the same ceremony, the three questions asked by the Empress being the same as those asked by the Emperor. I have since been told that the same questions are generally asked all persons who receive the imperial audiences.

After being escorted back to the waiting room for a few minutes, we were taken to the entrance room, where we signed our names in the guest books of the Emperor and Empress, and then took our carriages and went home.

We saw the Emperor again on his birthday, November 3, while he was reviewing the imperial troops. After all the crowd was assembled, the band struck up the wonderfully impressive national air, and he was driven into the vast parade ground in a gold, green and red lacquered carriage drawn by two superb sorrel coach horses. He sat on the back seat, while one gentleman of the court sat opposite him. He was driven around the entire hollow square in front of his troops, and then took a position in front of a pavilion, while the troops marched by between him and the band. His face was immovable and showed no sign of recognition of the crowd. In former times the face of the Emperor would have been veiled from his subjects.

The Crown Prince was there, too. He is a slight, delicate-looking young man, quite blond for a Japanese. Neither the Empress nor any ladies of the court were present at the review, but we caught a glimpse of her Majesty once again at the palace gate when she was returning home from the opening of some hospital or charity. The car tracks that her carriage had to cross were covered with earth, so as not to bump her carriage. As she rode by in the center of a cavalcade of horsemen and carriages the people uncovered their heads, but uttered no cheer, as that was not permissible, as in olden times.



We heard many stories in Japan of the goodness of the Emperor and the graciousness of the Empress. The Emperor is a man of great industry. He is at his work every morning at 8 o'clock. He takes few holidays is always ready to see his ministers at any time. He is said to be plain spoken and expects all about him to be the same. He has a marvelous memory and is said never to forget a face. He is also a remarkably good judge of men and has rarely made a mistake in selecting his officials. His pleasures are simple. He is fond of animals and writing poetry, which always has a manly ring about it. We were permitted to visit one of his private gar-

dens. He had driven there the previous day with the Empress. In the little summer house, commanding a view of the garden, was a room, in the center of which were two purple plush chairs. It was there that their Majesties had sat looking at the lovely landscape of lake, boulders and woods. The ladyfrom the court who accompanied us did not think of crossing the sacred threshold.

The Empress is a devoted patron of all charitable enterprises and gives much of her money tó them. She has no children, the Crown Prince, like his father, being by one of the imperial concubines. The old plural marriage system will cease with the present reign. The new Emperor has only one wife—the happy mother of three healthy boys.

It is said the new Emperor will be less reticent and austere than his father. He is more fond of travel and going about among the people. Indeed, plans were said to have been made by which he was soon to go around the world. These, of course, will now be given up. When a child it was expected he would not live to grow up, as he was threatened with tuberculosis. But tho he has thrown off this dread disease, he is not robust. Still he is likely to have a long and useful reign. May it be as illustrious as that of his great and noble father.

NEW YORK CITY.

Sunrise Songs

BY HIS MAJESTY MUTSUHITO, EMPEROR OF JAPAN

Sashi noboru
Asahi no gotoku
Sawayaka ni
Motamahoshiki wa
Kokoro narikeri.

The thing we want
Is hearts that rise above Earth's worries, like
The Sun at morn, rising above the clouds,
Splendid and strong.

Asakeburi
Tachisou sue ni
Shirarekeri
Tami no nariwai
Susumi yuku yo wa.

I stand at morn,
And view the smoke curling above the roofs,
In greater volume, and thereby I know
The age is one of growing industries.

Yo wo mamoru
Kami no megumi wo
Aoge, hito!
Kuni no chikara no
Masari yuku ni mo.

O man, look up, even in the hour of weal,
When Progress leads the nation, and revere
The grace of God that watches o'er the Earth

Kumori naki
Hito no kokoro wo
Chihaya furu
Kami wa sayaka ni
Terashi miruran.

When hearts of men
Are cloudless, free from all defiling strain,
The mighty gods, clearly beholding them
Fill them with their pure light.

Ame wo urami
Hito wo togamuru
Koto mo araji,
Waga ayamachi wo
Oruoi kaesaba.

No need to bear
Grudge against heaven, or wreak one's spiteful spleen
Against one's fellowmen when one reflects
On his own errors.

The Independent

Entered at New York Post Office as Second Class Matter
Publisher, Clarence W. Bowen
130 Fulton Street - - - - New York

A WEEKLY MAGAZINE FOUNDED IN 1848
One Year, $3.00 Single Copies, 10 Cents

Single copies over six months old, 25 cents. Postage to any foreign country in the Universal Postal Union, $1.75 a year extra; to Canada, $1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as those offered by any responsible agency.

An order for the change of an address should be received two weeks before the change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of the publisher's price any book reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with $1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. Even so, we cannot hold ourselves responsible for their return. Authors should preserve copies of their manuscripts.

Advertising rates will be furnished on application.

The Need of the Peace Commission

LAST week, Wednesday, the Democrats of the House of Representatives again went on record as opposed to the addition of the customary two dreadnoughts this year. This, we are glad to say, seems to be final. Still, as the militarists are evidently now about to make one desperate effort to compel the House to rescind its action, we revert to the subject again this week.

Last year Congress appropriated $127,026,100 for the United States Navy. This included the authorization of two dreadnoughts, two colliers, eight torpedo boats, four submarines, two tugs, one gunboat, one river gunboat and one submarine tender. It also included the upkeep of the existing 312 vessels of the navy, of which twenty-nine were first-class battleships. In 1884 the appropriation for the navy was $15,869,733.88. Ever since then there has been a steady increase year by year, until we reached the present stupendous figures, and the end is not yet if the militarists are to have their way. The army appropriations have shown a parallel increase in the last twenty-five years, so that now our total expenditures for all military purposes approximate three-quarters of the total revenue of our Government. In other words, we are spending over $1,000,000 a day on wars, past and future. It will be noted that this great military expenditure is a new thing in our life—a matter of less than a generation. What does it all mean and what is the end to be?

There can be only two reasons for diverting so much wealth of the country to unproductive purposes. One is that we are likely to be attacked, the other that we propose to attack somebody. The latter supposition, we suppose, may be left entirely out of account. Not even the most rampant "Fighting Bob" dares urge the building of a great navy for aggression. What nation, then, intends to attack us. The lesser nations never will and manifestly a small navy is sufficient for them. England, Germany, France and Japan are the only nations against whom we might conceivably need a great navy. As we said two weeks ago, England, France and Germany are on record as being willing to sign arbitration treaties with us in which *all* questions shall be submitted to judicial settlement. Whenever the Senate is ready we can negotiate them—and it will not cost us a dollar. We speak with confidence when we aver that Japan is likewise prepared to enter into such an unlimited treaty whenever the time is ripe. We challenge any unprejudiced person to point to a single instance within the last fifty years when Japan has violated either the letter or the spirit of the great peace pact signed between the Shogun and Commodore Perry in 1854, the first sentence of which reads:

> "There shall be perfect, permanent and universal peace and a sincere and cordial amity between the United States of America on the one part and the Empire of Japan on the other and between their people respectively without exception of persons and places."

Our managing editor, Mr. Holt, when he returned from a peace mission to Japan last autumn, went into this subject fully in his article published in our columns May 16. And now President Eliot, in a speech delivered at Honolulu last week, on his way home from the Orient, confirms the statement of every responsible returning visitor when he says:

"Japan is not in the least inclined to be warlike and will fight only as a last possible resort or if attacked."

The burden of proof that we need a great navy, then, is clearly on those who fear an attack from England, Germany, France or Japan. This, of course, they cannot specifically furnish. They have to fall back to that last ditch of the militaristic argument, namely, that the navy is the best form of national insurance, tho they never have explained yet why the rates should keep going up when the risks are going down.

Now, we do not know, nor does anybody else, for that matter, whether our present fleet is "adequate" or not. There has never been any prolonged and scientific study of the matter by our own or any other government, despite the requests of both the first and second Hague conferences. But this we do know: the question of two dreadnoughts more or less in our fleet of twenty-nine cannot be a matter of life and death. To hear some people talk one would think the refusal of Congress to authorize two new battleships at this session was equivalent to committing national suicide. President Roosevelt as recently as 1907, as his letter to the New York Peace Congress indicates, was apparently satisfied with one new battleship each year. President Taft supposed two new dreadnoughts a year would be enough till the completion of the Panama Canal in 1915, when we could get along by simply replacing those that became obsolete with modern ships.

It is quite clear, then, that we have been building up our navy in a happy-go-lucky sort of way, without any reasoned out policy. Why should we act from year to year on advice of interested persons only, without having a look forward to see what is our final aim, and whether indeed it is a final law of civilized nations that in developing states military expenditures increase as wealth expands, and that "war shall consume all fruits of progress." Now at last the good natured country seems to have awakened, only to find itself committed to this great militaristic policy, while vested interests—military and commercial—are berating us to keep on the path whose logical end is national bankruptcy.

What is to be done? On June 24, 1912, Congress passed a joint resolution calling upon the President to appoint a peace commission of five members, whose duty it would be to make a report, first, on the limitation of armaments; second, on the feasibility of an international navy, and, third, "to report upon any other means to diminish the expenditures of government for military purposes and to lessen the probabilities of war."

The bill was initiated by the World Federation League of New York, together with the New York Peace Society and the World Peace Foundation of Boston. It was subsequently indorsed by the Mohonk Arbitration Conference, the New England Peace Congress and the Third American Peace Conference at Baltimore. Abroad it was hailed with delight by the International Peace Congress at Christiania and by the Conference of the Interparliamentary Union at Brussels, which latter pledged the delegates present to work for the creation of similar commissions in their respective parliaments. As a result, France, Holland, Sweden, Denmark and Norway have appointed bureaus or commissions to study the peace question, while other nations have intimated to President Taft their willingness to appoint commissions after the United States has taken the lead. President Taft, however, has never appointed this commission. The House of Representatives has just renewed the time in which it can report and continued the appropriation for its maintenance. A similar resolution is before the Senate, which will undoubtedly pass it. We understand that President Taft has not appointed this commission on the advice of eminent members of the Carnegie Peace Endowment, which is unfortunate for the President and for the endowment. We advise President Taft to appoint this commission at once. He has everything to gain thereby and nothing to lose. If the commission's report is unwise, it does not have to be adopted. If it is practical, it may be the basis for a movement that will be the beginning of the end of "the greatest scourge of mankind."

The President's experience in campaigning for the peace treaties with England and France last year showed him that nothing he has ever done has

struck such a responsive chord thruout the nation, and even the world, as his championship of law instead of war as a means of settling international disputes. The people are ready for a constructive peace policy. Taft has already proved his leadership in the cause. Let the government now, thru the peace commission, give an exhaustive impartial and official study of the question. The spectacle of the civilized nations of the world blindly spending all their surplus wealth in preparation for war, which never has or never can settle anything, but which party is the strongest, is enough to make one lose faith in humanity. The time has come for the United States to start a movement for the solution of the armament question. In the mean time, until the peace commission offers plausible arguments for a greater navy, we urge everybody to support the House of Representatives in its present commendable course.

Issues in Congress

THE Republican party in Congress began in March last to surrender the tariff position which it had held and sought to defend. At that time it offered (Mr. Payne being the agent), in opposition to the Democratic wool bill, a bill which provided for almost as great a reduction of duties. The proposed reduction in each case, it should be noted, was from the duties of the Payne-Aldrich tariff, enacted in 1909. The party is still retreating or surrendering. This is not an unjust characterization of the action taken in the Senate last week, altho the voting was not strictly upon party lines. The Penrose wool bill, supported by Republicans, called for a considerable reduction. It is true, however, that the La Follette bill, which displaced the Penrose bill, was passed by a combination of the Democrats with ten Republican Insurgents. By a similar combination the so-called excise bill (for a disguised income tax) was passed, but the bill reducing the Payne-Aldrich duties on sugar was carried thru by what was practically a Republican vote, Regulars and Insurgents standing together for it.

A wool bill will be sent to President Taft. Probably it will resemble very closely the bill which he vetoed a year ago. Will he veto this one? A year ago the Tariff Board had made no report to him about wool. But the board's findings have now been in his hands for a long time, and it is admitted that they warrant a large reduction. The Republican bill offered in March last was practically an admission that they warranted a reduction of about 40 per cent. If the bill soon to some before him does not go beyond the limits indicated by the board's report, we expect he will sign it. By the enactment of such a measure the wool duties will be made about what they ought to be, but credit for a just revision cannot be claimed by the Republican party. It will belong to the Democrats, mainly, but a share must be given to their Republican Insurgent or Progressive allies. To the same combination must be ascribed the passage of the excise bill, which, altho not a measure of ideal excellence, is acceptable, we think, to a majority of the American people, who desire the imposition of an income tax.

For reasons which we have set forth heretofore, we believe that tariff revision continues to be a leading issue, as it was in the elections of 1910. It has weight with a great many persons because of their conviction as to the effect of tariff duties upon the cost of living. For a similar reason the same persons demand prosecution and restraint of Trusts. We have before us an article taken from a newspaper and entitled "What the Trusts Have Done." It compares the prices of flour, pork, lard, butter, eggs, cheese, sugar, beef, coffee, etc., forty years ago with the present prices. The figures show a notable increase, and the assertion is made that Trusts are responsible for it. Many believe that this is true. Has the Republican party, by its representatives at Washington or elsewhere, sought to prove that the increased cost of living is not due to tariff duties and the Trusts? Has it made any attempt whatever to dispel wrong beliefs on this subject? It has neglected an issue of great weight with a very large number of voters, altho it had sufficient warning at the elections of 1910.

Democratic tariff bills may be crude and defective, but they appeal to the masses. This is also true of Democratic platform utterances about Trusts and of

such Trust bills as the Stanley committee is about to lay before the House. These bills will not be passed at the present session. It is quite probable that they never will become laws. But they have some political value because they tend to meet the demands of a great number of voters. They are partly good and partly bad. With the bad must be counted the provision that control of 30 per cent. of an industry shall be presumptive evidence of unlawful restraint of trade.

In our opinion, the combinations, or large industrial corporations, should not be smashed, but should be subjected to Federal control and regulation. It may be mentioned that both Mr. Taft and Mr. Roosevelt are in favor of regulation by a Federal commission, altho Mr. Roosevelt would not go so far as the President has gone in prosecutions under the Sherman act. Both would have offenses defined in additions to that act, for the enlightenment and guidance of business men. The Democratic majority of the Stanley committee, Mr. Littleton excepted, are moving, it seems to us, in the wrong direction, but we think their attitude is satisfactory to a very large number, possibly a majority, of American voters.

If these voters have been misled, if they ascribe exclusively to tariff duties and the growth of Trust combinations the increase of the cost of living, have the Republican leaders attempted to correct such of their opinions and beliefs as are not well founded? The elections of 1910 should have suggested to these leaders the political expediency of making at once the best case that could be made in opposition to a prevailing conviction. They did not heed the suggestion, and now, so far as tariff legislation is concerned, they are driven to action which tends to confirm popular support for their political opponents.

Common and Proper Names

KINEMATOGRAPH. the inventors called it; also, cinematograph, kinetograph, kinetescope, bioscope, biograph, tachyscope, vitascope, vitagraph, phenakistoscope, zoopraxiscope, praxinoscope, zoetrope, animatograph, theatrograph and kinemacolor.

But the people, they call it "the movies."

Now the name of a thing is what it is called by. There's no getting around that. And any common name may get to be a proper name if it lives long enough. By that time it comes to be realized even by the philologists themselves that the reason why the name they gave in the beginning did not stick was because it was really an improper name. This christening job undoubtedly belongs by rights to the philologists. It is their business to supply new words as needed by the demands of advancing civilizations, but they either neglect the duty altogether or when they are called upon for professional services in this line they are apt to make such a botch of it that their fabrication is rejected by a unanimous popular vote exprest *viva voce*.

The reason of the failure of the philologists is chiefly because they stick to two principles, both false. One is that a name must be a description, as complete and accurate a descripion as possible. The second is that it is improper to admit that we know anything nowadays that the Greeks and Romans did not know and name. Even to borrow a prefix from that antient and honourable language, the Sanskrit, as the Russian chemist Mendeléef did for ekaluminum, is not regarded as quite good form, and as for making up a word out of whole cloth, or *ex nihilo,* so to speak, that is either impossible, as they sometimes claim, or extremely reprehensible.

Now we believe in the right of the people to free and unlimited coinage of words, but, like most other popular rights, this is most useful when it is not used. The words that come into the world with necessity for a mother and are suffered to grow up without any proper christening are often poor words, sometimes very bad words, uncouth, uncultured, unruly. The most that can be said for the most of them is that they are no worse than words that owe their origin to the classical dictionary. We do not like "the movies." But neither do we like the other names for the thing, none less than three syllables, which patentees and professors have been trying to make us say for the last quarter of a century. All honor to the unknown hero

who invented "kodak." It is likely to get into the language, and we hope it will, for it will serve as a permanent memorial of the man who had the courage to resist calling the new film snap-shot camera a "dermotachyphotographthingumbob."

The terminology of games is worth considering, for there words come into existence Topsylike, and by the time they get big enough to attract the attention of the professor of English they are too big for him to extirpate. Take the golf clubs, for example—cleek, brassie, driver, machie, lofter, mid-iron, putter and niblick; not a bad lot, are they? At least they are handy, slip easily out of the mouth and into the ear, and somehow they fit the object, too. Niblick, now, is almost onomatopoetic. Yet these are self-made words as innocent of ancestry as a Pittsburgh millionaire. Why could not an expert in phonetics and philology, one who knows how words arise, grow and decay, and why, make names as good as these whenever the occasion arises? A new invention, world movement, philosophy, art, [illegible] ical party, or costume is always born anonymous, like a baby, and some name has to be hunted up for it right away. If we call the child Maud or Mary the first day she may stay so called. But if we baptize her Angelina Antoinette or neglect it altogether she will probably be called "Kiddie" for the next seventy years.

It ought to be understood by this about how much the traffic will bear and charges established accordingly from the beginning. If a word is long, cumbrous or pedantic people will not use it. They will smash it and use one of the pieces, or else hunt up another one for themselves. People refused to ride on the elevated railroad; they took the L instead. An omnibus was built for them, but they prefer a bus. In London, instead of the underground railway, they take the "tube." In Paris they take the "Métro" instead of the Métropolitain. It is shorter. By what miracle of common sense did we get a Subway in New York instead of a "Subterranean Viaduct"? If an attempt had been made to foist that upon us we would now be traveling daily in the "Duct." Those of us who learned to ride on a velocipede afterward came down to a bicycle and now we use a wheel if anything. But what to do with the automobile we do not know. It is too long as it is to get around in narrow streets and it is a pity to have to employ "auto" or "motor" or "machine" or "car." That we have to resort to such expedients is all the fault of its godfathers. If they had given it on the start a name of decent length and sound, whether they got it from the Greek, Latin, Arabic or Choctaw dictionaries, or made it up by shuffling the logomachy cards, we would have adopted it without a quibble. One of the reasons why the metric system is so slow in coming into use is because it was handicapped from the beginning by an ingenious but impossible set of names. In countries where it is in vogue roads are measured and corn is weighed alike by the "kilo." The people are really not unreasonable in this matter. They are willing enough to submit to the dictation of experts as to what words they shall employ provided only that the experts use common sense in catering to their needs.

The Menace of Law

FETICH worshipers—who, with other kinds of idiots, abound notwithstanding our schools and universities and other enlightenment machinery—will send us letters in the next three weeks castigating us for printing such an abhorrent phrase as "The Menace of Law." Nevertheless we print it, and we have something to say about it.

That civilization, morality and the physical stamina of the human race might be destroyed by law, aided and abetted by sentimentality, is not only conceivable; it is a possibility. The law-police-murder-combination in New York City at the present time illustrates it.

A few years ago a hold-up-and-murder gang was doing a flourishing business in a Western State. Its headquarters were at a town whose chief institution was the State university. Without any beating of drums, or scare heads in the newspapers, the gang began quietly, but visibly, to waste away. Morning after morning selected members appeared in negligée attire dangling from telegraph

poles in the town, or from cottonwood trees in the suburbs. Finally, on one particularly pleasant morning, when the sheriff of the county was sitting inoffensively on his front porch, without his gun belt on, a stranger, stepping briskly up to him, felled and collared him. Twenty men instantaneously appeared on the scene as if they had sprung by magic from the ground. The sheriff begged for "time." No word was spoken in reply. The only answer he got was a noose around his neck. The other end of the rope was thrown over the limb of a tree and pulled. The extermination of the hold-up-and-murder-gang was completed. The sheriff had been its leader.

No reader of THE INDEPENDENT will bring against it the accusation of advocating or sympathizing with lynch law. But it is a part of the business of THE INDEPENDENT to observe the evolution of human society and to report what goes on. Truth compels us, in the discharge of this function, to say that the extermination of hold-up-and-murder-gangs is a good thing. It makes life more endurable for decent people. Truth compels us to say also that the extermination of hold-up-and-murder-gangs, even when they are organized, led and directed by officers of the law and other respected citizens, is entirely possible. It has been accomplished in many parts of the world by legal methods as dexterously as it was managed illegally in the Western town whose story we have told. We are of opinion that if the occurrence in front of the Hotel Metropole in this city a few nights ago had happened in certain Western communities that we are acquainted with, the slayers of Rosenthal would ere this, by due process of law, have ceased to ride in taxicabs, and that there would have been conspicuous vacancies in the Police Department and in the ranks of active politicians.

We dislike to have to explain the obvious. It is as painful as explaining a joke, but sometimes it is necessary, and for the benefit of such as need friendly assistance in their mental operations, we state, with all the formality of a text-book proposition, a principle of civilization that our law-abiding communities are in grave danger of forgetting. It is this:

A law-abiding civilization has broken down when due process of law makes crime safer and justice more impossible than they are in communities which spontaneously regulate their affairs by the rough-and-ready methods of the vigilantes.

To carry this plainness of speech a little further yet, it is time for law-abiding people, who rightly abhor the lynching method in all its manifestations, to subject their own self-righteousness to a searching examination. It is time for them to wake up and realize that law and the law-abiding spirit are means to an end, and not the horns and belly of a golden calf to be worshiped. When they cease to accomplish the end, they become not only contemptible and worthless; they become a menace to peace and order, and in time the very citadel of crime.

The civilized world has looked too exclusively at one of the advantages which a régime of law should have over the rule of a vigilance committee; and has taken but little note of another possible advantage which should be quite as conspicuous and quite as useful. Due process of law is supposed to protect the innocent man when wrongly accused, and it ought so to protect him with a close approximation to certainty. At the same time, it ought to suppress crime and to exterminate the criminal elements of the population *more swiftly and more certainly than a vigilance committee could do it*, and it may rightly be charged with failure if it does not accomplish this part of its function as completely and as dexterously as it accomplishes the protection of the innocent.

Countless explanations have been offered by historians and sociologists of the decay, decline and fall of civilizations, from Babylon to New York. We will suggest one more. No civilization has ever yet grappled satisfactorily with the practical problem of making due process of law as effective a means of ridding the population of its criminal elements as the spontaneous methods of barbaric tribes and frontier communities are; and until a civilization arises which can achieve that task, it will not get much higher nor go much farther than the civilizations of the past.

The Korean Conspiracy

A DELIBERATE attempt is being made to rouse the religious sentiment of the United States against Japan. It is charged that the Japanese Government is persecuting Christianity in Korea, if not actually cherishing the design of extirpating it from the entire peninsula. If so, this is important. Let us, therefore, state the facts.

On the 13th of June Mr. Sakai, the Japanese Public Procurator at Seoul, applied to the local court for the trial of 123 Koreans charged with conspiracy against the life of Count Terauchi, Governor-General of Korea. Count Terauchi is the successor of Prince Ito—Japan's greatest modern statesman—who was murdered by a Korean assassin. Ito was a civilian, humane and conciliatory. Terauchi is a military man, efficient, just and severe. We printed a eulogistic sketch of him in THE INDEPENDENT of February 29, 1912, by perhaps the leading Presbyterian missionary in Korea, Dr. James G. Gale, of Seoul.

It is charged that the leaders of the conspiracy in 1905 formed a secret society called Shimmin Hoi (New People's Society) for the purpose of assassinating members of the former Korean Government as well as native Koreans who had signed the treaty annexing Korea to Japan.

Among those arrested and cited for trial are a large number of Christian converts. Charges have been made that the prisoners have been tortured, in order to secure evidence. These have been denied by the Governor-General, General Akashi in charge of the police department, and other high officials. In the course of the trial twenty missionaries were named as having been implicated in the conspiracy. Before the open court, however, the prisoners claimed that they were forced to make these charges and that they were not true. The case is now being publicly tried in Seoul and is not likely to be finished for some weeks. The accused are provided with both Japanese and Korean lawyers. All who are familiar with the codes of Japan now in operation in Korea know that all evidence given under torture is worthless and must be ruled out. While torture was quite common under the old Korean law, under the Japanese regime the criminal code has been reformed. Is it likely that the nation whose humane treatment of prisoners during the Russian war has never been equaled in history should now resort to barbaric methods of treating prisoners? If it should be proved, however, that torture has been used, it must have been done by the subordinates, who will be subsequently punished by the Japanese Government.

There is no ground whatever for anxiety as to the fate of missionaries in Korea. They are all under the constitution and codes of the Japanese Empire, and their rights are fully guaranteed. The Japanese Government has in the past been very kind to them, and in no instance has a missionary suffered arrest or prosecution.

The missionaries and the Korean Christian churches enjoy the widest religious liberty and their good work is appreciated by the Japanese in Korea and at home. Some think Korea is now on the point of being completely Christianized by the missionaries, as were the Hawaiian Islands a century ago. There is no evidence that the present case is one of persecution or a desire to cripple the Korean Christian Church. Indeed, not a few eminent Christian men have high offices in the Government of Korea.

Prince Ito took a deep interest in the Y. M. C. A. of Seoul and secured large sums of money for it. For the past seven years the Government has made an annual grant of $5,000 toward its support, the only donation for such a purpose ever given. The relation of the missionaries to the Government General is and has been very friendly. They receive social recognition and also travel about in perfect security. The truth is that the Japanese authorities have often given testimony to the value of mission work in the past, and the missionary influence is highly valued in dealing with the Koreans.

Whether the Korean conspirators are guilty or innocent does not appear yet at this stage of the trial. But the American public can be absolutely certain of these three things: First, that the Japanese Government makes no charge, and, in fact, has not the remotest idea that the

missionaries are implicated in the conspiracy; second, that the Japanese Government and the missionaries in Korea are on the most excellent terms; and, third, that the Japanese courts can be expected to mete out justice in the present case.

The Chicago Delegate Contests

A subscriber in Colorado asks us whether, in our judgment, there were "enough fradulently or dishonestly elected delegates seated at the Chicago Convention to cause the nomination of Mr. Taft." We carefully examined the published record of the hearings before the National Committee at Chicago. These hearings were fully reported by agents of the press associations, who were present. Nothing was concealed. The number of seats affected was 254. With respect to about three-fourths of them the claims of the Roosevelt contestants were so flimsy that none of Mr. Roosevelt's friends in the committee—and there were nearly twenty of these—could vote in support of them. This was their attitude even toward all (two excepted) of the contestants from Indiana, altho Mr. Roosevelt was saying on the same day that the Taft delegates from that State represented "nothing but fraud as vulgar, as brazen and as cynically open as any ever committed by the Tweed regime in New York." We have examined such additional evidence as has been available since the convention, including the results of the careful and conscientious inquiry made by Nicholas Murray Butler, president of Columbia University, who was a member of the committee on credentials. We do not know what the decision of a court of law concerning a few of the cases would have been, but our belief is that there were not "enough fraudulently or dishonestly elected delegates to cause the nomination of Mr. Taft." Our opinion also is that if all of the contestants set up in Mr. Roosevelt's interest had been seated there would have been enough fraudulently elected delegates to nominate him. And we are confirmed in this opinion by the action, and virtually the admissions, of his loyal friends and supporters in the committee.

The Mikado as Poet

Since the Emperor of Japan occupies a unique position as the embodiment of the spirit of his people, it is eminently fitting that he should be gifted with the power of voicing in verse his meditations and emotions. He began writing poetry at the age of eight, and his father used to require of him five or six stanzas a day as part of his regular school work, believing that the future ruler must be trained to handle sword and pen equally well. In recent years it has not been uncommon for him to compose forty or fifty poems a day. These are written in the established form of Japanese verse, the *uta* of thirty-one syllables, each presenting a distinct thought or emotion, in the form of a picture, metaphor or symbol, as regular in structure as our sonnet, but more compact than a quatrain. Even in translation we can often appreciate the nobility of the thought and the delicacy of the imagery. The reason we have published so many of the Emperor's poems in THE INDEPENDENT was not for the purpose of putting a royal name upon our cover, but because we believed that they revealed the Japanese temperament more than volumes of description and because the *uta* seemed to us as worthy of admiration as a *netsuke* or *kakemono*. Poems by the Emperor, Empress and Poet Laureate, usually both the original and the translation by Arthur Lloyd, may be found in THE INDEPENDENT for September 29, 1904; December 8, 1904; February 9, 1905; February 13, 1908; February 18, 1909; January 27, 1910; February 10, 1910, and December 22, 1910. An article on "The Mikado a Poet," by Yone Noguchi, was published February 18, 1900, and an article on "The Imperial Family of Japan," by Jihei Hashiguchi, on August 3, 1905.

Municipal Dairies

Kansas City, Mo., is to have a municipal dairy. It will be operated by the city's Park Board, and will be constructed in Swope Park, Kansas City's 1,300-acre playground, if the plans announced by President Ashley, of the board, materialize. The aim is to set a sanitary standard for other dairies.

Pure milk will be sold at a low price to the Swope social settlement in the tenement district, where hundreds of babies are cared for during the summer. There is also pending before the Los Angeles Charter Commission a provision to the effect that the city shall be given power to engage in the dairy business and to establish distributing stations for pure milk; that the municipal newspaper, instead of being under the direction of the commissioner, who is to be auditor or controller, shall be administered as now, by a commission of three to be named by the mayor and confirmed by the other city commissioners, and that the proposed municipal labor bureau shall be a part of the civil service department.

Clerical Immunity

The *motu proprio* of Pius X restoring clerical immunity from civil courts seems destined to become the Wandering Jew of Sarto. It is homeless. No man can put his finger on the precise spot of the world's map where it may find a local habitation. Already the Pope himself has declared that it is not binding in Germany, Austria-Hungary, Ireland or the United States. He might have added Great Britain, France and Portugal, which one and all ignore it. Lately the Chancellor of the State Department of Belgium declared in that country's Parliament that the minister of Belgium to the Holy See, in obedience to instructions from Brussels, had asked the Cardinal Secretary of State if the unhappy decree was in force there. The latter answered in the negative. Moreover, he explained that the *motu proprio* affected the clergy only in those countries in which still exist the ancient privileges of exemption. As that had been abolished more than a century ago, Belgium was exempt. In Switzerland, both in Lucerne and Tesino, the civil authorities declared that the decree had no juridical value, for all clerical privileges had been abolished by the laws in existence. In its turn Holland rejected it. The Minister of Justice announced in Parliament that it was not applicable in the Netherlands. The unlucky decree still, like the roaring lion, goes about seeking whom it may devour, but finds no prey.

Farm Property

From the Census Bureau we are just in receipt of information concerning farm acreage and the value of farm property. The largest increase in farm values took place since 1900, but the greatest increase in the number of farms was between 1870 and 1880. The average size of farms has very generally been decreasing since 1850. There was a slight increase between 1880 and 1900 owing to the large ranches which had been public domain, being counted into the farm list in the census report of 1900. Since that time the ranches have been broken up greatly, and farm property everywhere in the United States has followed the same course. Small farming seems to be the future destiny of the American people, and it will be intensive farming, that is growing truck and fruit in connection with grains, for home consumption. The average size of farms in 1850 was 202 acres; it is now less than 125. The average acreage of improved land to a farm is about 75 acres. The value of farm property in 1910 was nearly eleven times as great as in 1850, but this increased value has been taken on with greatest rapidity within the last ten years. The acreage value averages for 1910 more than double that for 1880. On the whole, the outlook is exceedingly good for our agricultural industry. There is a growing power in the agricultural colleges to mold public sentiment, and there is an increased desire of our best educated young men, and women as well, to take hold of some branch of land culture.

A Fixt Easter

The hope of taking Easter out of the list of movable feasts and giving it a fixt date, with all the other ecclesiastical days that depend on it, rests on the will and character of Pius X. As the London *Tablet* says:

"The present Holy Father, who, to outsiders, appears so intransigent wherever there is a question of doctrine, has shown in matters of discipline and liturgy the utmost broadmindedness, and is little subject to the scruples and faintheartedness of routine. Liturgists and rubicists, while all acclaim and admire some of these reforms, groan inwardly and screen their faces at his boldness. There where Benedict XIV or Pius IX and Leo

XIII hesitated, he advances with a firm step. . . . His *Motu proprio* on the feasts and the late Bull on the Breviary and the Psalter are a reform of which one would never have dared to dream only twenty years ago. He has laid down his hand on the Roman Psalter, which dates from perhaps the fifth century, and on a host of customs until now considered sacrosanct. The ecclesiastical calendar itself has been modified quite recently by the Decrees of July 2, 24, and 28, 1911."

The reform of the Canon Law he is also laboring upon with ardor. Easter must come on Sunday, but there is no real reason why it need follow the vagaries of the moon. As likely a choice as any would be to put Easter on the Sunday next succeeding March 25.

As to the use of catechisms for the younger children, there is criticism from a source not expected. A French priest sent to Pius X a copy of a catechism he had prepared for the instruction of children for their first communion, expecting it to be approved. But the Pope wrote him a letter, in which he said, among other things: "Let this kind of publications alone. Oral instruction is sufficient for very little children." In the same tone Cardinal Gennari wrote last year:

"Small catechisms for first communicants are useless and harmful. They are useless because oral instruction is sufficient. It can be given in one day. . . . They are harmful because by using them the child is made to wait until the words of those catechisms are learnt by heart. Keep those catechisms out of the hands of children."

It must be remembered that under the new rule the children go to first communion at the age of seven.

The effect of being personally conducted in a foreign country, so as to see only what one is shown, appears in the report of an address on his impressions of America by Father Benson, who was lately in this country preaching and lecturing in Catholic churches. He got this impression of New York:

"There is only one religion in New York that is a real power, and that is the Catholic Church. There are other denominations, such as the Protestant Episcopal Church—the equivalent of the Church of England—the Presbyterians, Baptists and others, but they count only as social assets. The Catholic Church, and she alone, grasps the American people."

It would be worth while to study the question why so many of the clergy of the Protestant Episcopal Church have gone over to the Church of Rome. Three students in the General Theological Seminary in this city have lately thus joined the Catholic Church. In announcing these last conversions the Catholic journals mention thirty-three other graduates of the same seminary who have become Catholics and twenty-two of its non-graduates. Fifty-five from one seminary is a very large toll to pay to a Church against which it is a protest, and the majority of them became Catholic priests.

The current rumors of the Pope's ill health have started the discussion of the next conclave. The two Italians who seem the strongest now are Rampolla and Ferrata, of Milan, both of whom have been badly treated by the powers that be in the Curia. Already an anti-Italian party is announced, who are for Cardinal Mercier, of Mechlin—the man whom Tyrrell so unmercifully flayed. This second party will amount to very little, while the first seems rather the embodiment of discontent than a serious hope.

The Presbyterian Church is one of the denominations which have never yet ordained a woman. Why not is not clear. A young graduate of Elmira College asked the presbytery to take her under its care as a candidate for the ministry, but it referred the case to the General Assembly for advice. In other denominations women do good service in the pastoral office; but there are those who think a woman should not teach a man. Yet even Presbyterian mixt colleges have women teachers.

A distinguished German theologian recently said that in the year 1600 the most universal and encyclopedic mind was Bacon. In 1700 it was Leipnitz. In 1800 it was Goethe. But he did not venture to say who in 1900 had the widest range of knowledge. Are there any such in this age of specialization?

Another mud slide in the Culebra cut. They need a muckraker in Panama.

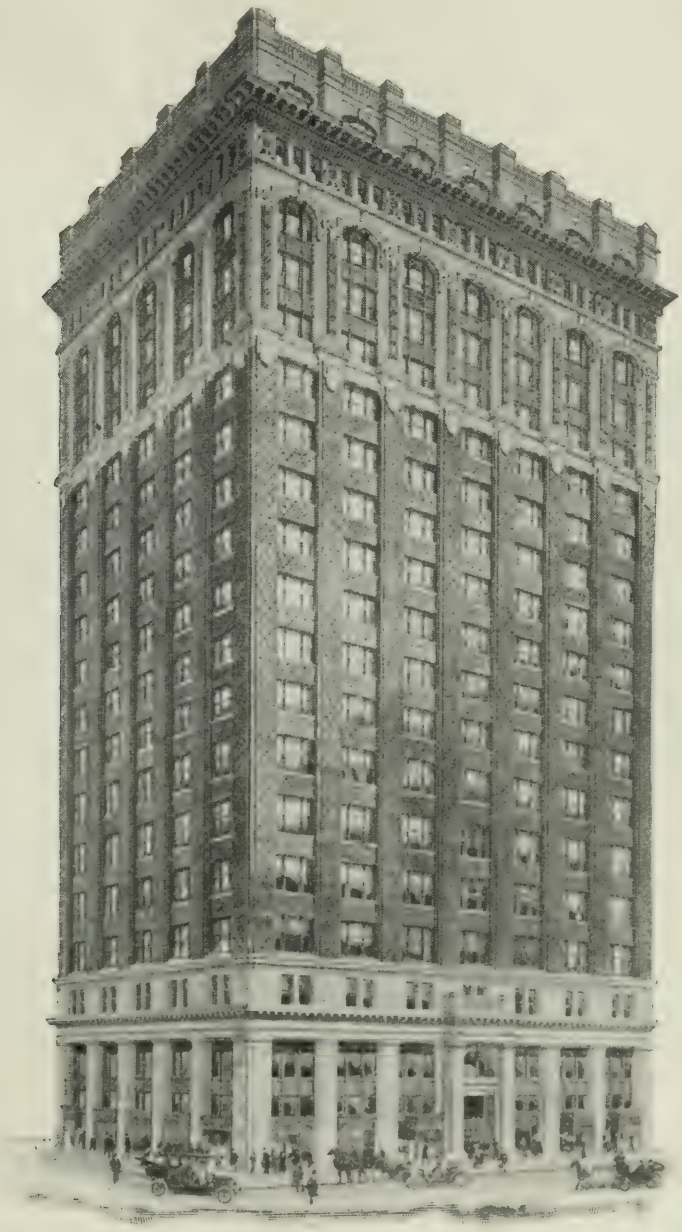
Financial

Millions Lost to Swindlers

A REPORT submitted to Postmaster-General Hitchcock last week and published by him shows that in the fiscal year which ended with June the American people were robbed of $120,000,000 by swindlers who sold their worthless stock, bonds, corner swamp lots, shares in speculative pools, etc., by a fraudulent use of the United States mails. The Post Office Department's inspectors arrested 1,063 of the scoundrels; 452 of them have been convicted and sentenced; 571 are awaiting final action in the cases against them. It may be pointed out that this loss of $120,000,000 was equal to 4 per cent. of $3,000,000,000. The annual stealings increase. In the preceding year they were $50,000,000 less. And this growth has taken place, altho the Department no longer is content with punishing merely by a fraud order, affecting the delivery of mail, but directs its inspectors to get evidence for use in criminal prosecutions. It does what it can, but it cannot protect the ignorant and those who are easily misled.

Many of the swindlers have offices or headquarters in New York. Several of the most successful of them have been arrested and prosecuted here, but the work was done by the Federal authorities. It has been the custom of these swindlers to take offices in the financial district, or in some noted building elsewhere. Many of those who have been robbed, guileless residents of the West or Southwest, have blamed "Wall Street" for their losses. This has commonly been the explanation given also by men who have lost money in bucket shops. They have believed, or have sought to make complaining relatives and friends believe, that bucket shops were closely related to, and in conspiracy with, the New York Stock Exchange. All these swindlers—the bucket shops, the sellers of mining stock, oil well stock, pool shares, and the like—have excited popular prejudice against legitimate financial operations and respectable banking institutions in New York. Perhaps it is not too much to say that to some extent they have suggested attempts at legislation. The banking institutions of New York, Chicago and two or three other cities might well, mainly in their own interest, but incidentally for the good of the public, assist the Federal and local authorities in the pursuit of the swindlers. This they could do, at small expense, employing competent detectives by means of their local organizations. Upon the money invested in such work there would be a large return in a more just public opinion and a more intelligent impulse for financial legislation, as well as in the protection of many honest but easily deceived men of small means.

Our Investments in Mexico



IT has been well known that American investments in Mexico are very large and greatly in excess of those of any other country, but the total generally accepted has been less than that which is found in a report sent to our Government last week by Marion Letcher, the American consul at Chihuahua. The report includes a table prepared by William H. Seamon, who has had long experience in Mexico as a mining engineer. In this table the investments of American, English and other foreign capital, as well as those of Mexican capitalists, are classified with respect to the various industries. The total for the United States is $1,057,770,000, the British total is $321,502,000, and the investments of all other foreign countries amount to $262,984,000. The largest items in the American list are as follows: Railway stocks, $235,404,000; railway bonds, $408,920,000; mines, $223,000,000; national bonds, $52,000,000; smelters, $26,500,000; the oil business, $15,000,000; the rubber industry, $15,000,000; live stock, $9,000,000; timber lands, $8,100,000; bank stocks, $7,850,000.

....The International Institute of Agriculture's estimate of the world's wheat output this year is 96.2 per cent. of last year's crop.

New Building of the Excelsior Savings Bank

THE new nineteen story building of the Excelsior Savings Bank, located at Twenty-third street and Sixth avenue, New York, opens for business this week. The former bank stood on this same site, but was vacated on March 25, 1911, in order that the Masonic Building, erected in 1870, could be demolished preliminary to the erection of the new fireproof edifice. There were 9,242 open accounts in 1900, 15,590 in 1905, and 22,848 in 1912. The deposits were $2,854,000 in 1900, $6,117,000 in 1905 and $11,179,000 in 1912, which shows a steady growth. The total assets in the eighty-sixth semi-annual statement of July 1, 1912, were $12,730,590. This included $7,688,500 invested in bonds and mortgages, $1,237,934 invested in bonds of cities and municipalities in New York State, and $1,651,692 invested in railroad first mortgage bonds.

The Excelsior Savings Bank was founded in 1869, and began business in the historic Booth's Theater Building. It remained in the theater building until it was torn down and then moved into the old Masonic Temple. Mr. William J. Roome has been president since 1900. The other officers are James C. Gulick, first vice-president; W. H. Barron, second vice-president; J. C. Griswold, secretary; Arthur Plage, assistant secretary.

NEW BUILDING OF THE EXCELSIOR SAVINGS BANK

Insurance

It Needs Looking Into

In the July 1 issue of *Best's Life Insurance News* we find a rather tart criticism of the Insurance Department of Illinois for the attitude it has taken in reference to a claim made by Mrs. Linda Carroll, of Seattle, Wash., against a fraternal beneficiary organization located at Springfield, Ill., and known as The Americans. *Best's* characterizes the conduct of the association as a piece of cold-blooded and impudent repudiation.

According to the story, Mrs. Carroll, an elderly lady, had regularly paid premiums to the American Benevolent Association and its successor, The Americans, since 1903; that she met with an accident in the fall of 1911 and made proof of her claim the first week in December; that subsequently many communications on the subject were addrest to the association by Mrs. Carroll and others; and that, aside from notifying her that her claim had been rejected, neither she nor her friends have been able to secure any replies from the association.

During the same period of time it appears that the claimant, thru her representative, appealed to the Insurance Department of Illinois, invoking its aid in collecting the claim. The department responded by sending a representative to the office of the association, inquiring why the claim was ignored, receiving in reply information only to the effect that it had been rejected and that the claimant had been so advised. The claimant and her representative insist that she was not notified of the rejection, and it is further urged that the Insurance Department of Illinois failed to secure anything from the association explaining why the claim was disallowed.

Altho this is a small matter, there is a vital principle involved. The smaller associations deal almost entirely with members of the humbler classes, and therefore The Independent communicated with Insurance Superintendent Potter, of Illinois. We are informed by him that the contract which Mrs. Carroll holds provides for the payment of $30 per month during the period of *total* disability, not exceeding six months, on account of bodily injuries effected solely from external, violent, accidental and involuntary means, etc., which shall immediately and totally disable the member from performing any kind of labor or business. On receiving Mrs. Carroll's claim The Americans, according to Superintendent Potter, notified her on December 30 that the board of directors had found she was not entitled to any benefits because she was not totally disabled. We are convinced by the information furnished us by Superintendent Potter that his department has done everything in its power under the law. Such criticism as may be made in the case should be borne by the association for issuing contracts which, by their terms, render them useless as providers of benefits unless the member is *totally* disabled. As the superintendent states, his department cannot enforce the payment of a claim; that is a matter for adjudication and enforcement by the courts. After examining the matter the superintendent exprest the opinion that the association has good and sufficient reasons for declining to pay. He also says that The Americans was examined by his department as of December 31, 1911, and that the total admitted assets were $87,412.89; that the outstanding liabilities, consisting of unpaid claims $28,266.26, and other liabilities $80, were $28,346.26.

This association seems to be solvent; it is admitted that an insurance superintendent cannot compel corporations under his jurisdiction to pay untried claim suits outstanding against them; but we are firmly of the opinion that the claim methods and the beneficiary certificates of The Americans of Springfield should be thoroly investigated and the results made public. There is a possibility that this association is not entitled to that measure of confidence which is necessary to an insuring concern.

Is your closed up town house protected by burglar insurance this summer?

The Independent

VOL. LXXII NEW YORK, THURSDAY, AUGUST 8, 1912 No. 3323

Survey of the World

National Politics

Replying to the elaborate statement of Mr. Hilles concerning the delegate contests at Chicago, Mr. Roosevelt has repeated his charges of fraud and theft. In a published letter he says:

"In my judgment no honest man, whether Republican or Democrat, can support Mr. Taft and claim any right to the suffrage of other honest men. Any man who fails to come out against the fraudulent Republican convention at Chicago has forfeited all right to the support of the rank and file of the Republican party and decent citizens generally."

In the House last week Mr. Bartholdt, of Missouri, defended the decisions of the committee with respect to the contests, and sharply attacked Mr. Roosevelt, saying:

"He came with treachery in his heart and fully determined to bolt if things went against him. Hence we are forced to the conclusion that, whatever its decisions on the contests, the National Committee would have been condemned if these decisions had not resulted in his nomination. The cry of fraud was premeditated, and the shameless ejaculation 'Thieves!' with which he shocked his audience on his entrance into Chicago was the battle cry of the new party. There could be no other, for principles and policies were forgotten, and if he himself had been nominated he would have made the race on any old platform, with his frantic followers shouting 'Hosanna.' There was no more effective means to undermine the old party than to defame its character. In order to put a new party on its feet it became necessary to run down the old one. Certainly no sane citizen will desert his party and all its happy associations as long as he has confidence in it, hence that confidence had to be destroyed. What was there more convenient than to seize upon the contests as the handiest 'big stick' for the work of destruction. If the National Committee had heeded the injunction 'Thou shalt not steal except for me' all would have been well."

The question whether negro delegates from the South should be accepted at the new party's convention having been raised, Mr. Roosevelt sent to Julian Harris, of Atlanta, a long letter, which was given to the press. It is an argument against the reception of Southern negro delegates. The character of negro delegates who have attended Republican conventions is severely criticised. Seven-eighths of those at the recent convention, Mr. Roosevelt says, voted to uphold fraud. A Progressive party cannot be built up in the South, he asserts, by relying upon and appealing to negroes; it is better to appeal to the best white men, and such a course will eventually be for the interest of the negroes. At the end of last week, in Chicago, the new party's provisional committee heard the pleas of contesting negro delegates from Mississippi, Florida and Alabama, but no decision was reached.——Some of the Bull Moose delegates, notably Everett Colby, of New Jersey, are emphatically opposed to discrimination against the negro, and Mr. Colby is said to be working with Professor Hayes, of Cornell, to have the convention recognize the race. The Roosevelt convention came to order in the Coliseum in Chicago on August 5, more than a thousand delegates assisting. Senator Dixon, Mr. Roosevelt's late campaign manager, made the first address, and was followed by former Senator Beveridge, of Indiana. As temporary chairman Mr. Beveridge declared: "We stand for a nobler America. We battle for the actual rights of man. . . . Constructive reform is to be the slogan of the new party."——In the Kansas case, relating to a decision of the State's Supreme Court virtually in favor of

allowing the names of Roosevelt electors on the Republican ballots at the approaching primaries, there has been a hearing before Justices Van Devanter and Pitney, of the Federal Supreme Court, on an application for a writ of error. The application was granted, but no order was issued. This was a victory for the Roosevelt men, whose names will go on the ballots, but there is to be a hearing before a full bench in October, and it is possible that the decision will be against them.——Formal notification of his nomination was given to Mr. Taft on the 1st by Senator Root, who in the course of his address assured him that his title to the nomination was absolutely clear and unimpeachable. Mr. Taft's reply was very long. Much of it was devoted to disapproval of some of the distinctive doctrines which Mr. Roosevelt supports. He reviewed the Progressive record of the Republican party and the record of his own administration, discussing at length the tariff and Trust problems. The address is the subject of an article in our editorial pages.——It was asserted last week, upon what was regarded as good authority, that Governor Wilson is in favor of a gradual reduction of the tariff. He will take no part in any factional controversy of his party in any State. Mr. Bryan has contributed $1,000 to the Democratic campaign fund.

Congress It was expected at the beginning of the present week that all of the tariff or revenue bills which have recently engaged the attention of the Senate and the House would be sent to the President, and that he would veto at least three of them. He might sign the Sugar bill, it was said, and, possibly, the Excise bill. Adjournment may be reached on or about the 15th.——Judge Archbald has submitted to the Senate a general denial of guilt with respect to the impeachment charges. His trial will begin on December 3.—— It was predicted last week that at a House caucus to be held on the 6th the decision of the recent caucus about battleships would be reversed. Thirty Democrats gave written pledges that they would vote for at least one ship. It was shown that twelve of the thirteen members of the Wilson campaign committee were in favor of making an appropriation for one or two ships. ——The Stanley Steel Trust Committee's majority report has been presented with the bills heretofore mentioned. Three reports are made by the minority of four Republicans. Two of the Republicans ask for Federal incorporation of combinations and the creation of a Commissioner of Interstate Industry, saying that this commission should have power to recommend a reasonable price in place of one exacted by a company holding a Federal charter, if this price should be found to be unreasonable.

Extending the Monroe Doctrine A resolution broadening or extending the Monroe Doctrine was reported to the Senate on the 31st ult. Two days later it was taken up and passed. It is as follows:

"Resolved, That when any harbor or other place in the American continents is so situated that the occupation thereof for naval or military purposes might threaten the communications or the safety of the United States, the Government of the United States could not see without grave concern the possession of such harbor or other place by any corporation or association which has such a relation to another Government, not American, as to give that Government practical power or control for national purposes."

The vote was 51 to 4, and those who opposed the resolution were Senators Cummins, of Iowa, and McCumber, of North Dakota, Republicans, and Senators Stone, of Missouri, and Percy, of Mississippi, Democrats. It is understood that the declaration was suggested by the results of the inquiry about Magdalena Bay, on the coast of Lower California. The committee conceded in its report that it had found no evidence tending to show that the Government of Japan was involved in the negotiations concerning that bay, but added:

"It appears from the evidence that the corporations or persons who have, or claim to have, title to the lands surrounding Magdalena Bay have made efforts to form a syndicate and to promote the sale of these lands upon the basis of the existence of some national value to a foreign nation in Magdalena Bay as distinct from any con-

mercial value which that bay and the adjoining territory might possess. The fact that such an idea has formed the basis of negotiations between the possessors of title to the land about Magdalena Bay and the citizens, subjects or corporations of a foreign Power seems to the Committee on Foreign Relations to afford an appropriate occasion for an expression of the view of the Senate regarding this and similar cases."

It is understood that President Taft and Secretary Knox regarded such a declaration as unnecessary. Some think that those who framed it had in mind recent reports as to the plans of certain European Powers to obtain control of harbors for the establishment of new naval bases in the vicinity of the Panama Canal.

The Panama Canal Bill

The pending Panama Canal bill has been taken up in the Senate from time to time for debate. All sorts of views as to the proposed exemption of our coastwise ships from the payment of tolls have been exprest. Mr. McCumber, who holds that exemption would be a violation of the treaty with Great Britain, said last week that as we had agreed by treaties with Panama and Colombia to let their warships go thru free of charges, we must also, by the requirements of the treaty with Great Britain, give free passage to the warships of all other nations. Mr. Taft, it is understood, would like to have the administrative provisions of the bill enacted now, and action upon the parts relating to exemption and to the exclusion of railroad-owned ships deferred, but a considerable number of Senators object to this course.——Panama's presidential electors have voted unanimously for Dr. Belisario Porras, who will take office on October 1. His only opponent, Pedro Diaz, withdrew some time ago.

The Islands

Owing to the revolutionary uprising in Santo Domingo, there is a quarrel between that country and Hayti, which has been accused of assisting those who are in revolt. It is asserted that the troops of each country have been crossing the boundary, that they have been fighting, and that prisoners have been put to death. Last week's dispatches from Hayti said that the Government there had warned all males between the ages of eighteen and fifty to be ready to be mustered into the army and to go to the frontier. For some time past there has been no news from Santo Domingo about the revolt, but statements concerning it have been given to the press by natives of the republic living in New York.——Cuba's Cabinet has passed a resolution saying that an American commission to inquire as to Havana's sanitary condition will be welcomed, and that, if one came, it would find nothing to criticise.——No additional cases of plague in Havana or Porto Rico were reported last week. A rat carrying plague germs was found in New Orleans, and it was thought that another had been found in Philadelphia, but this proved to be an error. At a conference of Southern health officers in New Orleans, it was decided that all Southern ports should be urged to make war upon rats.——A large forest of rubber trees has been found on the island of Hawaii by the Government's botanist. It is on land owned by the Government, but leased to ranchmen.

Revolution in Nicaragua

General Mena, formerly Nicaragua's Minister of War, is leading a revolution against President Diaz and the Government. Diaz demanded his resignation on the 28th ult. Refusing to resign, he was deposed. At once he left the capital, taking all of the police force, which had been commanded by his brother. He and his followers took possession of Granada and two or three other cities, and attacked the capital. Owing to the interposition of the United States Minister, Mena consented to a compromise, agreeing to the appointment of Dr. Barbarena in his place, pending a settlement with the President. On the 1st, Mena ignored the compromise and began again to fight. He controls the steamers on the lake, and it is said that exiled followers of ex-President Zelaya have joined him. The Government's troops lack ammunition. Ex-President Estrada, who is in New York, and against whom Mena plotted, says that Mena, while Minister of War, enriched

himself by taking Government funds. Owing to a failure of the crops, many of the people are destitute, and the refusal of our Senate to ratify the loan convention has embarrassed the Government. One gunboat of our navy is on the west coast and another has been sent to Bluefields.

Mexico General Salazar, commanding part of Orozco's army, compelled the Mormon colonists near Casas Grandes to give up their arms and ammunition last week, and looted their houses and stores. There were 700 or 800 families, in four settlements. He told these Mormons (they are American citizens) that he would kill all of them to compel intervention, if the United States did not soon intervene. He hated our Government, he added. The Mormons fled to El Paso, leaving property valued at $7,000,000. Orozco, then at Juarez, said he would disarm all Americans. To our consul he remarked that he did not recognize our Government. If the United States, he continued, would let down the barriers and allow him to get arms and ammunition he would oust Madero and make peace in sixty days. Secretary Knox sent to him a message of warning, and another to President Madero, urging the latter to send reinforcements northward. There were 2,600 refugees in El Paso. Our Government gave them tents and rations. Congress, on the 2d, appropriated $100,000 to be used in carrying them to their Mormon friends in Arizona and Utah. On that day 2,000 of Orozco's rebels were beaten and routed at Ojitos by General Sanjines, and some thought this would prevent an invasion of Sonora. On the night of the 3d, about fifty shots were exchanged across the river at El Paso, by United States soldiers and Mexican rebels, the latter having fired first. Four houses on the American side were struck by bullets, but no person was injured. In the south there was a serious uprising, with three days' fighting, 40 miles southeast of the capital, followed by a battle with several hundred Zapatists 40 miles west of the capital. Some days earlier, sixty Federal soldiers were surrounded and killed in the State of Mexico. On the 2d, 200 Zapatists captured a passenger train on the line from the capital to Vera Cruz. The Indians of Oaxaca are again in revolt. Madero's Government has ordered $875,000 worth of rifles in Germany. Our Government has settled the controversy about the Chamizal tract, at El Paso, by agreeing, it is said, to buy it from Mexico. The people of El Paso complain that our Government shows weakness in its treatment of what is called an intolerable situation. They have been moved by the stories which the refugees tell.

South America In the House, at Washington, last week, there was passed a resolution, introduced by Mr. McCall, of Massachusetts, asking Secretary Knox for information as to slavery and peonage in the rubber district of Peru's Amazonian Territory of Putumayo. The Secretary will send in reply the recently published report of Sir Roger Casement and a preliminary report recently received from Mr. Fuller, an agent of the State Department, who is now making an investigation. Dr. Romulo Paredes, Peru's commissioner, who left Washington for Putumayo last week, says there has recently been no cruel treatment of natives, except in isolated instances. Peru, he adds, has the rivers patrolled by troops in boats, and has established wireless service with Iquitos. In the House of Commons at London, on the 1st, Sir Edward Grey said the British Government was in close touch with our Government concerning this question, and that the British and the American consuls would start together on the 3d for Putumayo. This would be the beginning of a systematic visitation of the district. Mr. Fuller reports that for various reasons the difficulties in the way of administering justice in Putumayo have been almost insuperable. ——In the Argentine Congress, last week, the Minister of Agriculture said that thus far the activity of the American Beef Trust in that country had been beneficial to stock breeders. This was shown by an increase of the prices for cattle.——For $57,250 Venezuela has bought from our Government the "Isla de Cuba," a small warship that was captured by Dewey at Manila.

Why the "Titanic" Sank

On July 30 the British Board of Trade's Court of Inquiry into the "Titanic" disaster presented its judgment, which was read by Lord Mersey, the presiding judge, before a large audience. The court holds the White Star liner's collision with an iceberg was due to the excessive speed (twenty-two knots) at which the ship was navigated. The court finds that a proper watch was not kept, that the arrangements for managing the lifeboats after their launching were inadequate, and that the steamship "Californian" might have reached the "Titanic" if she had tried to do so. Lord Mersey recommends that the attention of all masters of ships be called to the fact that it is a misdemeanor to fail to go to the assistance of a vessel in distress. Captain Lord, who commanded the "Californinan," is still in the employ of the Leyland line, but has no ship under his command. According to the Court of Inquiry the track which the "Titanic" followed would have been reasonably safe had proper vigilance been used; and there was no discrimination against third class passengers in the rescue work. J. Bruce Ismay, chairman and managing director of the White Star line, and Sir Cosmo Duff-Gordon, a passenger, are exonerated from charges of improper conduct. More watertight compartments in seagoing ships are recommended; also the provision of lifeboats for all on board, a better lookout, a continuous wireless service, and more efficient drills. Lord Mersey's judgment is free from rhetorical embellishment, being highly technical in its language. Lord Mersey says of the "Titanic's" captain's course in maintaining high speed in spite of ice warnings that this was in accordance with custom, due to competition and the passengers' desire for quick passages. He adds: "In the circumstances I am unable to blame Captain Smith." Senator William Alden Smith, who conducted the American investigation into the tragedy, says of the British inquiry that it has been "thoro and painstaking, and speaks for itself." Its conclusions "accord with the findings of the Senate committee." The London press finds Lord Mersey's judgment "masterly," while deploring the inefficiency of the Board of Trade.

Turks and Italians

At Constantinople, notwithstanding the announcement in the Chamber of Deputies that Turkey is ready to enter into peace negotiations with Italy if conditions safeguarding her "honor, dignity and rights" are granted, attention is focused upon the internal situation. The march of two army corps on Constantinople has been threatened; all the police officials nominated by the Young Turks have been replaced by officers belonging to the Military League; and, owing to the calls made on it by Macedonian disorders and the Italian war, the loyal garrison of the capital is said to amount to only 3,000 men. Several persons were arrested on August 4 for participating in a Young Turk meeting last week, and an *iradé* has been issued granting amnesty to 130 political exiles, including the dignitaries of the old régime. The decree dissolving the Chamber of Deputies and directing new elections to be held within three months was expected for several days before it was delivered to the President of the Chamber on the morning of August 5; but the President suppress this document that the Chamber might pass a vote of censure upon the Cabinet before adjourning. In adjourning, the Chamber failed to agree upon a date for reassembling. Revolvers were drawn in the course of the debate, and Djavid Bey, a deputy from Salonica and ex-Minister of Finance and Public Works, vehemently declared that the Cabinet had shown a reactionary spirit and trampled upon the national Constitution. The Young Turks claim a majority in the Chamber and hold that the Sultan must now form a Cabinet consisting of members of their party.——The war with Italy has now continued since September 20, 1911, when the Italian Government published its official declaration of hostilities. The only severe engagements have been those between the Italian troops and the Turkish and Arabian allies on the Tripolitan coast, in which the Italians have been generally successful. The invaders have, however, found it difficult to advance into the interior and their camps have been constantly harrassed. The slow progress of the Italian troops has been a great disappointment to their partisans.

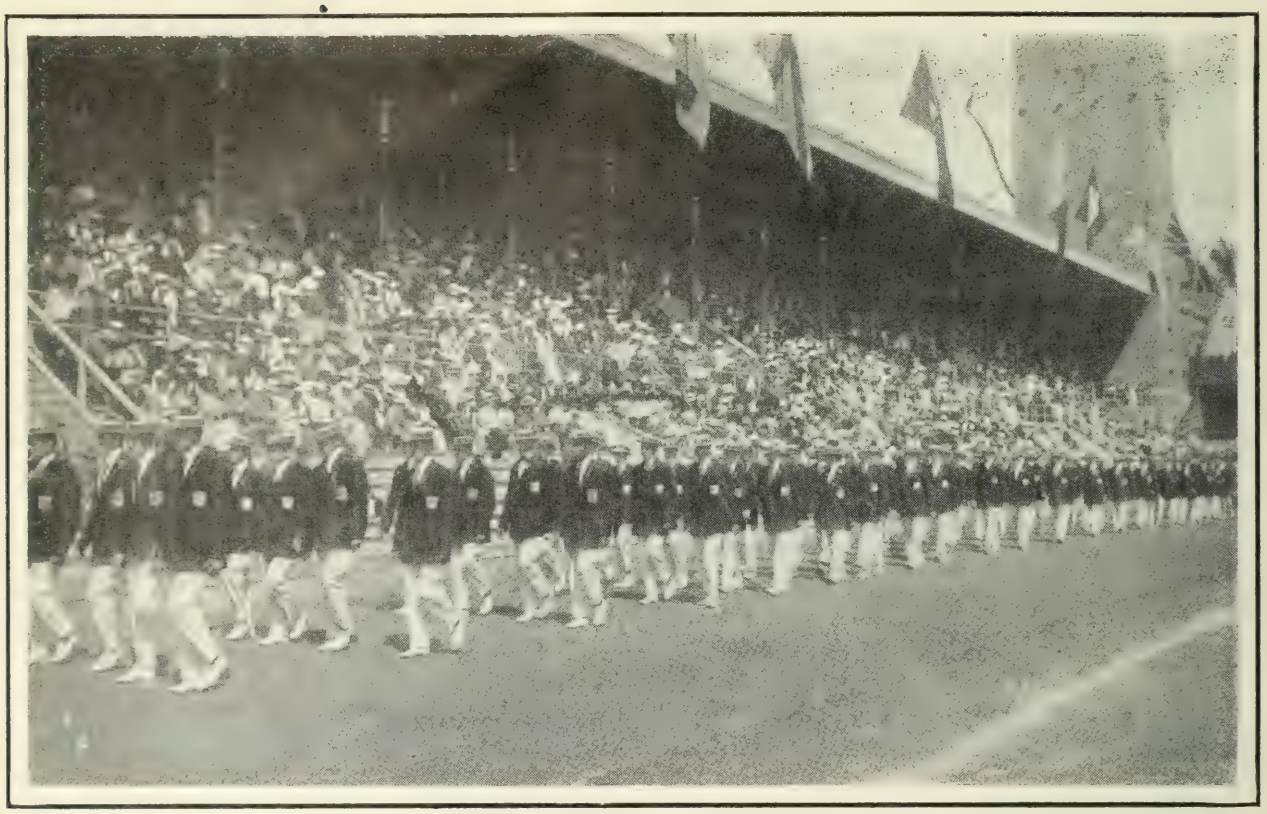
In the meantime many Turkish islands in the Ægean Sea have been occupied by the Italian fleet, and demonstrations have been made at the mouth of the Dardanelles. In the Red Sea an Italian squadron has bombarded small Turkish towns on the Arabian coast. The Italian poet, Gabriele d'Annunzio, lately gave an interview stating that Italian public sentiment in regard to England was changing, that nation being censured for failing to adopt a firm attitude at Constantinople. He added that malicious attacks in the English press on alleged Italian atrocities in Tripoli had infuriated his nation against Great Britain. These statements have been combated by a part of the Italian press and enthusiastically approved by other newspapers.—— Mount Etna broke into an eruption on the night of August 3, fire, smoke and lava bursting almost without warning from the crater. Several earthquakes followed, one of them severe enough to throw the population of Catania into a state of panic.

Two Emperors of Japan

Mutsuhito, one hundred and twenty-first Emperor of Japan, died, as was stated in a contributed article in our issue of August 1, early on the morning of July 30. He had ruled for over forty years, having been born in Kyoto November 3, 1852. Since 1904 the Emperor had suffered from diabetes, followed by various complications. For many hours before his death he was unconscious. President Taft sent condolences to the Empress Dowager and to the new Emperor immediately upon Mutsuhito's death; he also issued a statement expressing his sense of shock, and alluded to the various meetings with the Emperor which it had been his fortune to enjoy:

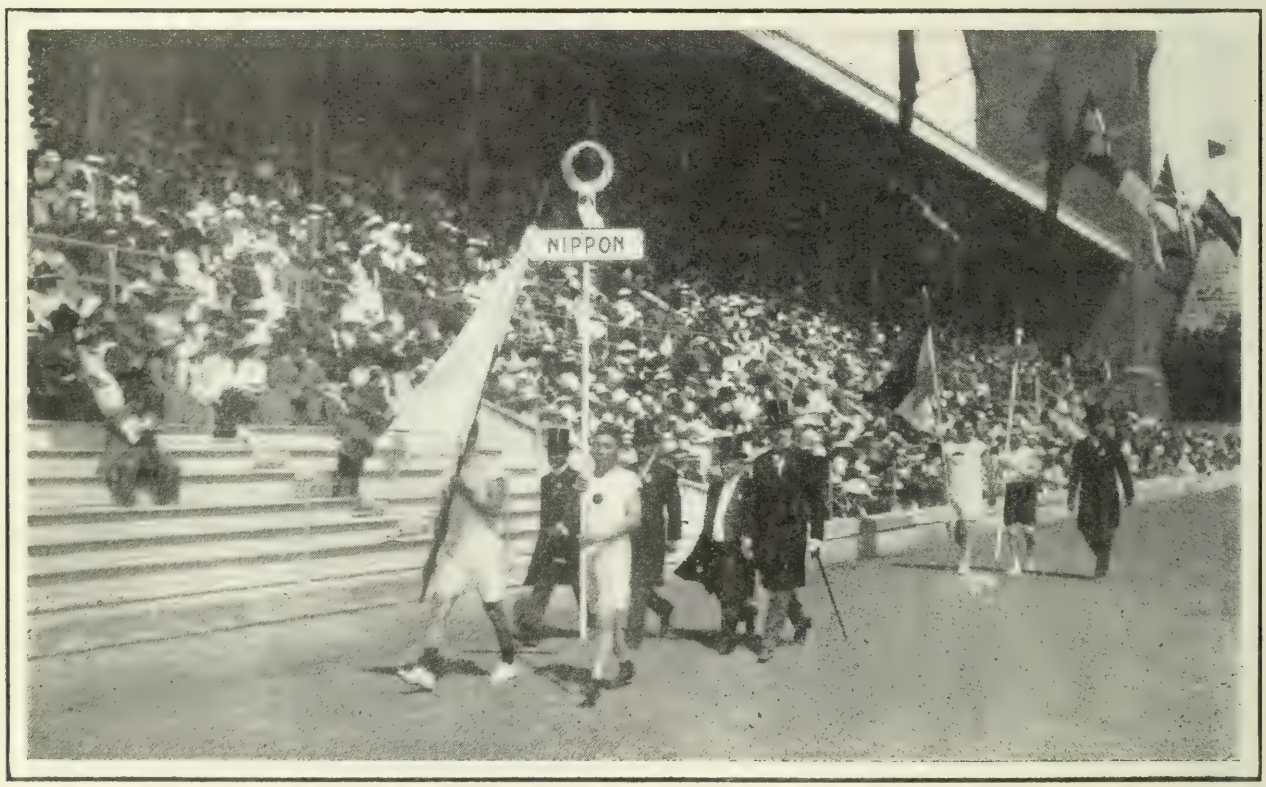
"The Emperor was a remarkable ruler. He was brought to actual power thru the Shogun rebellion and his life has assured the growth and expansion of the Japanese empire. The Emperor was a hard worker and gave great attention to matters of government. . . . Rarely in the history of the world has such progress been seen or can be so clearly traced to the ability of certain men who led in it and who were the Emperor's selection and enjoyed always his support."

EMPEROR YOSHIHITO



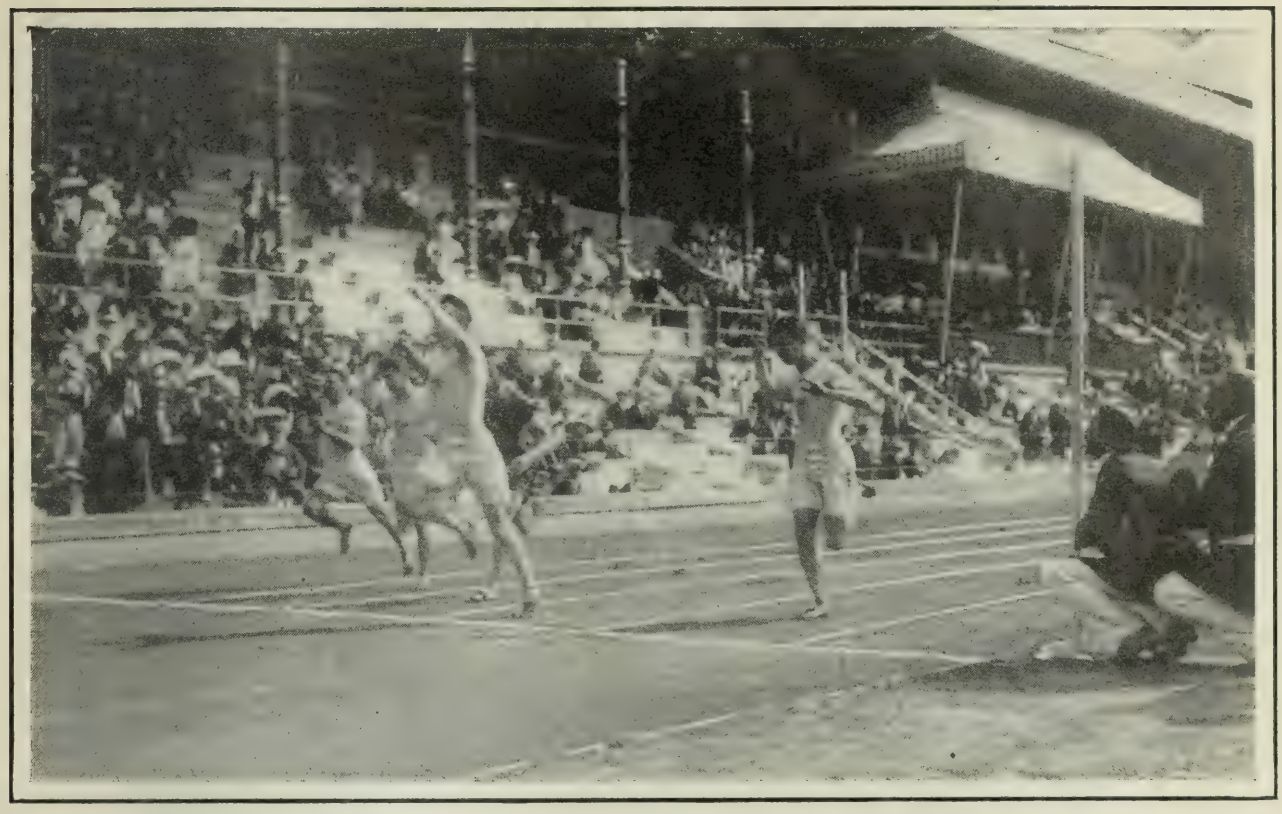
The third son of the late Emperor, who now takes the throne, was nominated heir apparent in 1887 and proclaimed Crown Prince in 1888. Yoshihito, the new Emperor, was born August 31, 1879, and is the son of Princess Yanigawara. He was educated at the school for members of the Imperial family at Tokyo. His training was not confined to the traditional studies, but included English, French and German. He speaks these languages and is fond of outdoor exercise, particularly horseback riding. Yoshihito has served as lieutenant-general in the army and vice-admiral in the navy. He married in 1900 the Princess Sabako, fourth daughter of Prince Kijo Michitaka, who has borne him three sons, the Princes Michi, Atsu and Teru. The first named is now the heir apparent, and is the first son to have been born to an Empress or Crown Princess in several generations. The maintenance of a direct line of male Emperors of Japan since the founding of the state, with the exception of twelve successions, when the Mikados were women, has been made possible thru concubinage. The royal concubines have usually been women of high rank, chosen from princely houses.——The new Emperor will, if he follows tradition, formally mount the throne in about one year. The late Emperor chose,

EMPRESS SABAKO



eleven days after his accession, the name of *Meiji*—"Enlightened Peace" or "Intelligent Administration." The era of *Taisei*—"Great Righteousness"—has now dawned. News of the death of the long-time ruler was received in Tokyo in great serenity, notwithstanding the love and honor in which he was held. A few days before his death the body of a young man was found in the outer palace park. The dead man had taken poison; in his pocket was found a letter stating that he had offered his life that the Emperor's might be spared. Business was generally resumed in the Japanese capital on July 31, the new Emperor having exprest a desire that there should be no further cessation, realizing the loss which was entailed on the poor.

Foreign Notes London dispatches suggest that the troubles of the Asquith Ministry are growing. Attacks upon the insurance law are bitter and continuous, and recent by-elections have favored the Opposition. An early adjournment is expected, but it is said that Parliament will meet again at the beginning of October rather than in November, as previously planned. The Prime Minister and Winston Churchill, First Lord of the Admiralty, have been invited to visit Canada by the Dominion Government, the suggestion being that they be present in Ottawa in the fall, when the naval plans will be under discussion in the Canadian Parliament. The decision of the Ministers has not been announced.——According to the London *Daily News* there have been over ten thousand prosecutions for non-performance of drills in Australia under the scheme of compulsory military training during the year ended June 30. In addition there were ten thousand failures to register to begin training last month. Magistrates are recommended by the Government to fine the delinquents and commit them to military custody, but this has aroused surprising opposition and many meetings have been arranged by the Australian Freedom League.——The Franco-Russian Naval Convention at Paris has nearly reached completion. Formerly the two Governments signed a convention which referred only to their armies; now the whole fighting forces of the allies will be brought within the terms of a treaty of offensive and defensive alliance.——M. Poincaré set out for Russia on August 5. At the station were M. Briand, Minister of Justice; M. Delcassé, Minister of Marine; General Lebrun, Minister for the Colonies; M. Mollard, Chief of the Protocol; M. Lépine, the Parisian Prefect of Police; the secretaries and attachés of the Russian Embassy to France, and the staff of the French Foreign Office. Near-Eastern questions and the Franco-Russian naval convention take the Premier to St. Petersburg, where he will confer with the Emperor of Russia and M. Sazonoff, the Russian Minister for Foreign Affairs.——From Paris it is reported that a movement is under way for the reconciliation of France and the Vatican. This would perhaps partly account for attacks upon the Poincaré Ministry by M. Combes, the veteran anti-Clerical, who has enjoyed the co-operation of Georges Clemenceau, like M. Combes a former Premier, but better known as a destroyer of French Ministries than as a constructive statesman. One of the motives for attack upon the actual ministry is M. Poincaré's advocacy of electoral reforms that would tend to reduce the power of the familiar type of log-rolling French Deputy.

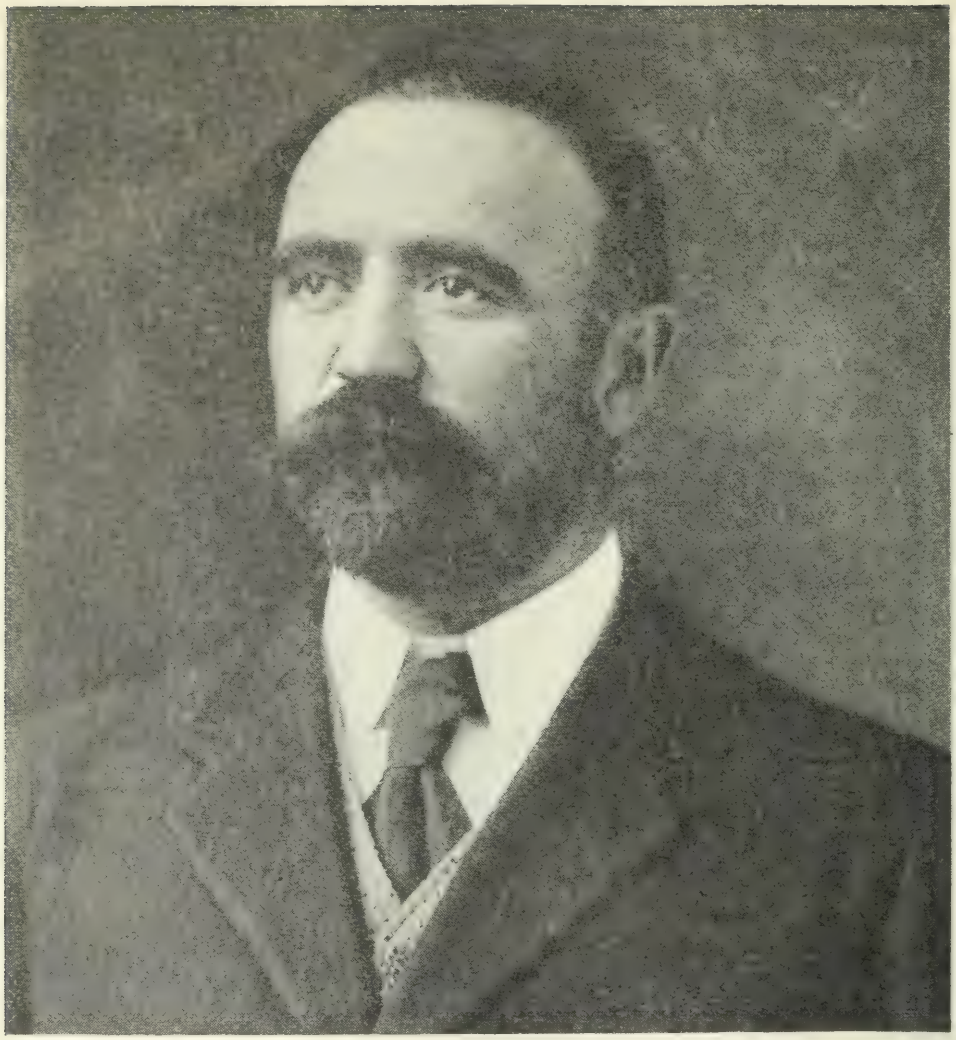


AMERICAN DELEGATION ENTERING THE STADIUM

The American team, clad in blue serge coats with the American shield on the left pocket, straw hats and white flannel trousers, made a favorable impression on the assembled spectators at the opening of the Olympic Games in Stockholm on July 6, 1912

THE JAPANESE DELEGATION AT THE OPENING OF THE GAMES

Japan, anxious to be counted one of the world powers in every respect, sent two athletes who were, however, unsuccessful in winning points from nations longer practiced in sports of this form. Jiu-jitsu is not yet included among the Olympic games.



FINAL OF THE 100 METER RACE

All the Americans entered in the 100 meter race secured places in the preliminary heats. In the final heat four out of five of the contestants were Americans, and the first three places were won by America. This sent the Stars and Stripes to the three mastheads in the stadium to designate a triple victory. The winner of the 100 meter race was Ralph Craig, of Detroit, Mich. Meyer was second and Lippincott third.

THE 10,000 METER RACE

This race was won by Hannes Kohlemainen, the phenomenal Finnish runner, in 31 minutes and 20 seconds. Tewanima, the American Indian, who took second place, is shown running in the sixth position.

The Situation in Mexico

BY PRESIDENT FRANCISCO I. MADERO

[We asked Pres. Madero to write for us a brief statement concerning the present condition of Mexico and we publish below a translation (from the Spanish) of his reply. We hope his predictions will speedily be fulfilled, but it must be admitted that there are serious difficulties to be overcome. Zapata's bandit army in the South has for a long time defied the Government, whose failure to subdue these rebels excites unfavorable comment abroad. In the North, Orozco has been beaten in battle, but the acts of his guerilla bands still present a grave problem, owing to attacks upon American residents and to the evident intention of several of the rebel leaders to compel intervention. At the suggestion of our Government, President Madero has sent reinforcements to the North, altho his army in the South has not been large enough for the work which should be done there.—EDITOR.]

I AM much pleased by the expression of opinion that you have sent me, in which you say that the American people regard with satisfaction the notable improvement in the political situation in Mexico. In regard to the desire you express, that I should make some statement about the actual conditions, I can say that the revolution may be considered as virtually stamped out. It was not started for any plausible reasons, nor from altruistic motives, but was due to

the inordinate ambition of certain unworthy sons of Mexico, encouraged by those who feared that the present change of government would, as is natural, curtail their influence and privileges.

The complete assurance of peace in Mexico is a question of only a few months, and all indications point to a considerable reaction in favor of business, since there is abundant capital, both European and North American, ready to be invested in this country, whose credit, notwithstanding the temporary troubles, has not suffered in the least in the great world markets.

The Government, of which I am President, is supported by public opinion and all the classes of society have gathered to its support, so that those moved by petty ambition and those who might have an interest in disturbing order have quickly given up their projects, realizing that failure would be inevitable.

The elections for Senators and Representatives for Congress have just been held, and the result has clearly shown that the Mexican people approve of the new regime established by the revolution of 1910, which I had the satisfaction of organizing. The union of the people and the Government leads us to expect a brilliant future for the republic of Mexico.

MEXICO CITY.

A Plan for an Endowed Journal

BY HAMILTON HOLT

[The following address by our Managing Editor, Mr. Holt, was delivered August 1 at the First National Newspaper Conference, held under the auspices of the University of Wisconsin at Madison. This conference was in session for three days and was the first of its kind ever held in this country. Well-known journalists from all over the land were present and many important papers were read.—EDITOR.]

THE subject upon which I am invited to address you this morning is, "Can Commercial Journalism Make Good or Must We Look for the Endowed Paper?" As stated this seems to imply that endowed journalism is antagonistic to commercial journalism, and that one who favors the establishment of an endowed periodical must have a low opinion of the press as it exists.

Having served all my professional life on a periodical that some of our readers are kind enough to believe has ideas and ideals, but which notwithstanding is run for a profit, I hasten to say that commercial journalism not only can but often does make good. Nevertheless, I am here today to make a plea for the establishment of an endowed paper and to tell you why I think it is desirable and opportune at the present moment.

Journalism of the highest order—and this conference is concerned with no other—is really a part of public education, an extension of university extension. It has the same triple function as the university—research, teaching and public service; the discovery of truth, the dissemination of knowledge and the championship of worthy causes.

The parallel between the university and the journal as purveyors of civilization becomes closer the more it is studied. There are three main types of a university—private, endowed and public. Valparaiso University, at Valparaiso, Ind., is perhaps the best type of a privately owned university run for profit. The majority of the colleges and universities in the East come under the endowed class, tho the students add to the income by tuition fees. The great State institutions here in the Middle West are the typical public universities. The private institutions are the oldest, the endowed naturally develop out of them, and last and best come the State universities. In the main the private universities devote themselves to teaching, the endowed universities to teaching and research, the public universities to teaching, research and public service. In journalism we have a somewhat sim-

ilar situation. We are now living in the age of privately owned journals run for profit. But these have now almost reached perfection from a technical standpoint and it seems that we are on the threshold of the era of the endowed paper. If the university analogy holds good we may expect the endowed journals to be followed by the great municipal, state, national and even international journals, and that they will be the final and crowning products of printers' ink.

But altho the commercial journals largely predominate today, there are already in existence a surprising number of endowed and public journals. There is no ground whatever for the common idea that journalism is necessarily commercial. My colleague, Dr. E. E. Slosson, has brought this fact out very clearly in an article in THE INDEPENDENT of February 15, 1912, and I am indebted to him for the following brief summary of the endowed and public papers, as well as for many other ideas embodied in this paper. The journals endowed or boosted by propaganda organizations are legion. Almost every association, whether political, religious, scientific, educational, or what not, has its special organ. The Socialist *Call* of New York, the *Christian Register* of Boston and the *Monist* of Chicago are examples of endowed or subsidized periodicals of propaganda.

The public papers are not so well known, but they are equally important. The National Government publishes thirty-nine varieties. *The Congressional Record, The Crop Reporter, The Labor Bulletin, The Monthly Weather Bulletin, The Naval Medical Bulletin, Public Health Report, Consular and Trade Reports* and *The Experiment Station Record* are the best known. Other examples of public journals are *The Bulletin of the Pan-American Union,* published at Washington by the twenty-one American republics, and *The Canal Record,* a weekly compendium of current events furnished free to all Government employees on the Isthmus. Among municipal organs, the colorless *City Record* of New York and the recently authorized Los Angeles *Municipal News* are perhaps most worthy of attention. It is only proper to add that on the authority of the President of the United States, every periodical in the land may be regarded as being subsidized by the Government because of inadequate payment for postal facilities. The country papers are carried entirely free within their counties, while, according to the Postmaster-General, the cent a pound rate far from compensates the Government for carrying second-class matter.

But the endowed paper needed at the present time is far different from any now in existence. What can it be expected to do that they cannot?

The two most important services of the press are:

First, to give reliable and complete information about any event *at the time when such information is needed* as a basis of opinion and action.

Second, to present to every reader *competent discussion of pending questions from different points of view.*

The ordinary commercial press does not perform adequately either of these social functions and it never can, because it does not "pay" to be as thoro or impartial as the ideal paper should be. A self-supporting journal must be to some extent sensational; that is, it must give undue prominence to spectacular events and crowd out quieter but more important movements. It represents the point of view of some particular party, interest or individual, and does not give equal opportunity for the presentation of opposing views.

The editor of the commercial paper being obliged to make both ends meet, must ever be under the conscious or subconscious fear of subscribers and advertisers, for manifestly such a paper cannot be published without their support. The readers when offended stop their subscriptions, the advertisers their advertisements. No wonder the aim of some papers is to discuss only those things about which everybody agrees or nobody cares.

A glance at the newspaper and magazine field indicates furthermore that those journals which speak their minds sincerely and frankly and under a proper sense of responsibility are with some exceptions hardly more than paying expenses. Few can employ more than two or three high-priced men or pay their contributors properly. The

majority of the editorial staff are composed of young, inexperienced men or older hack writers, whose salaries approximate that of the average college professor. You have heard of the college professor about to go to Europe on his sabbatical year. When the bursar asked him how he would have his salary sent, he replied, "In postage stamps." These papers with a moral character are consequently estopped from carrying out many of their best ideals. And all the while their sensational rivals, being able to offer larger salaries, entice away their best editors, artists and contributors, whose talents are soon prostituted to the lower level of the new employment.

But if a journal is to have an eminent, enterprising and trustworthy staff, capable of *finding out the facts about current events with accuracy and despatch,* it cannot be expected to be self-supporting any more than a university engaged in fostering all the arts and sciences and maintaining a faculty of nation-wide repute. If a journal is to perform the two essential duties of careful newsgathering and competent comment it must have an assured income of sufficient amount at the start to enable it to stand the stress of sensational and commercialized competitors and to demonstrate its usefulness to a large circle of readers all over the country. Once established and recognized as a truthful and impartial medium it would have an enormous educational value. Tho it might not be read by the millions it would be indispensable to all libraries, journalists, preachers, teachers, the most intelligent professional and business men and the leaders at least of the wage-earning class. It would also exert a great influence for good on other papers by forcing them to raise their standards of accuracy and fairness. Some think, however, that the endowed paper would not be responsible to public opinion, that it would be in danger of falling into what is supposed to be the frame of mind of a judge who holds his office for life and feels independent of the popular will. Without arguing the point as to whether our Federal judiciary make better or worse public servants than judges elected for short periods, it seems to me that there would be no danger of the endowed journal becoming reactionary if the right type of men were chosen to manage it. The editors and publishers of the endowed journal should be recruited not from the sanctums and counting-rooms of the great commercial journals, but from the journals with ideals or even from the universities themselves. There is many a college president today who would conduct an endowed journal better than any fifteen-thousand dollar commercialized editor now at the head of some sensational success.

Another guarantee that the endowed paper would not settle down to otiose stagnation and self-complacency is the rivalry that would exist between it and its commercial competitors. The commercial press with its boundless enterprise would make life intolerable for a board of trustees of an endowed journal that did not live up to their very highest opportunities.

But how shall the endowed journal be organized? First, shall it be a daily, weekly or monthly? I can see no reason why all three types should not be endowed. But if some great capitalist, or some group of public-spirited citizens want to endow a paper that will have the greatest influence thruout the entire nation, it cannot be a daily. The country is too large. A daily will not be read more than a few hundred miles from its seat of publication. No man in Chicago, for instance, will read a New York daily, no matter how good, if he can get substantially the same news twenty-four hours ahead in a Chicago paper. In a small country like England or Holland of course the case is different. Nor can a national paper in the United States be a monthly. The intervals at which a monthly comes out are too great to permit it to have much influence on pending events. The national American paper then must be a weekly. A weekly alone can circulate all over the land and exert a maximum influence on current events.

The money to endow such a great national weekly should be given outright to a board of trustees composed of the most eminent men of different political parties and social classes, whose duties should consist in supervising the finances and selecting the managing editor and seeing that the journal lives up to its

principles. The functions of the board should correspond to those of the trustees of a university. Personally I am opposed to endowments in perpetuity and to self-perpetuating boards of trustees. Any vast endowment ought to be expended, both principal and interest within fifty or one hundred years. Conditions at the end of fifty years may or may not make the endowed journal desirable. If it is desirable, then that generation should be able to provide for its own endowment. A more permanent influence will be exerted on human civilization by the rapid expenditure of both principal and interest, even tho at the end of the period in question nothing of the original gift remains. Instead of a self-perpetuating board of trustees, I should hope to see some plan adopted by which each year the subscribers of the journal, or some other appropriate body would select one or two members of a slowly changing board. This would obviate the improbable, tho not impossible, danger of the endowed journal becoming in a few years a deterrent to social progress, a stronghold of conservation or, to imagine the worst possible outcome, a shelter for exploiting interests.

The real responsibility of running the endowed paper would of course fall upon the managing editor. In general his duties would be analogous to that of a university president, i. e., he would be the executive head of the institution, the connecting link between the trustees on the one hand and the editorial board or faculty on the other.

The managing editor should select, subject to ratification by the trustees, a salaried staff of about half a dozen editors, of similar views but diverse talents, each to be in charge of a particular department, such as politics, finance, industry, literature, religion, science, art, education, etc.

The managing editor should also engage a large corps of regular editorial contributors, from various parts of the United States and foreign countries, specialists in their respective subjects to be paid at space rates.

The leading political parties, reform organizations, labor federations, religious denominations, etc., would be asked to designate authorized representatives who would be given a definite space in which to discuss the topics of the time and advocate their ideas.

In the advertising department I should like to see an innovation tried. Beside the ordinary commercial or display advertisements, space should be given to reading matter not published in the news columns of the journal, such as political platforms and pleas, personal views, poems and stories published at the author's expense, complaints and controversial communications. This department edited by the people would be lively, informing and profitable, for there are thousands of people who would be glad of a chance to bring opinions and literary efforts before the public in a periodical of wide circulation.

If this idea should prove popular it might conceivably happen that many propaganda societies would abandon their separate organs and take space each week in the endowed journal. In this way they would be sure to get their ideas before important people with less cost of time, effort and money.

As the board of trustees would be nonpartisan, or rather poly-partisan in character, so the journal should not be the organ of any party, sect or individual. It would have no policy of its own except to publish reliable news and competent discussion of the events and questions of the times. Its motto would be "Comprehensiveness, Impartiality and Accuracy." It would not, however, be a dry and colorless sheet, but more readable and interesting than any now published because of the diversity of views and the ability with which they are discussed. The editors would have it in their power by their choice of topics and authors to direct public attention to what they regard as most important, while at the same time they would afford an opportunity to any one to voice any view he wishes, provided it is done with due regard for the decorum of debate. Some may not agree to this neutral policy, but will hold that a paper to exert any influence must have a creed or platform. It must be, they say, progressive or conservative, partisan or independent, entertaining or instructive, yellow or gray. It cannot be all things to all men. But if the paper gave all sides an equal hearing it is difficult to

see how any subscriber could find fault inasmuch as he would get what he wanted, while on the other hand such a policy would multiply the paper's appeal. The weakness of the objection is more clearly seen when it is remembered that the most important things in life and therefore the most important things to write about are not controversial in character. Nine-tenths of the things that an endowed paper ought to present to its readers are non-controversial, and only when certain aspects of politics, economics, ethics and religion are treated would it be necessary that the champions of two or more sides be given a hearing.

Assuming, then, the existence of such an endowed weekly, what are some of the things it might reasonably be expected to do? I mention only a few of many that will occur to you all.

It would present a more complete report than is now possible of the important happenings in all countries.

It would not exaggerate the importance of violence and war by making them conspicuous and sensational. It would direct the attention of the people to the triumphs of peace by giving proper prominence to industrial and scientific progress which is generally ignored by the newspapers of today. Nothing contributes so much to the promotion of peace and good will, in international and industrial relations, as first-hand acquaintance with the views and feelings of other classes and parties.

Whenever there was a disturbance in any part of the country, such as a race riot, election outbreak or strike, it would send into the field a corps of trained investigators whose sole purpose would be to discover the truth and to tell it, not to foment discord or to create a sensation.

For instance, instead of sending one man to tell the people about the Lawrence strike, the endowed journal could have afforded to send three, representing the employers, the employed and the public, and make them sign a joint report. I myself happen to be one of a board of three judges appointed to settle all disputes between employers and employed in the great garment trade in New York City, and I know by experience that the joint opinion of three men is more than three times as valuable as the individual opinion of any one. Now few publications can afford to send an expert commission to report facts, or even a special correspondent.

The endowed journal would secure opinions upon pending questions of the day, such as the tariff, high cost of living and patent laws, from the best informed authorities, sociologists, economists, financiers, statisticians, historians and business men.

It would not only have competent criticism of art and literature from diverse standpoints, but could also establish *a new department much more valuable to the people* which has hitherto been impossible because of fear of the advertisers, namely *criticism of commodities.* In this department experts would treat other things in the same way as books and pictures are now treated. All the automobiles, typewriters, soaps, safety razors or piano-players on the market would be impartially compared, pointing out frankly their comparative merits and specific defects. Being endowed it could afford to defend itself from the libel suits which might be expected to follow until the public got used to this novel kind of criticism.

To conduct such a journal as to make it of real value would be expensive because the endowed journal would set the highest standard of typography, literary style and pictorial illustration, and because it would be necessary to pay well for the gathering of authentic news and for articles by specialists. While it was winning its way and working out its methods and before its unique character and value became generally recognized, the expense would have to be largely borne by the endowment. After a few years there should be a large income from subscriptions and advertisements, and this could then be put either into the improvement of the journal or the reduction of subscription rates so as to in either case extend its influence. If the endowed journal did not in due time secure a wide circle of readers it would indicate that it was not succeeding in what it aimed to do.

An endowment of $5,000,000 would provide sufficient funds to carry out this plan. Who will give it?

The Reorganization of the Navy

BY GEORGE VON L. MEYER

Secretary of the Navy.

[We recently published a series of articles on "What Is the Matter with Our Army?" concluding April 18 with a contribution from the Secretary of War, Henry L. Stimson. How the Navy has been reorganized during the last few years is explained in the following article by the Secretary of the Navy.—Editor.]

TO establish an organization in the Navy Department which would enable its head to administer it with the greatest possible efficiency and economy, and to insure a continuity of policy, the system described in this article was put into force in December, 1909. The Navy Department was divided into four obviously logical divisions: those of Operations, Personnel, Material and Inspections. For the head of each division an officer was selected who was specially qualified for the duties assigned to him. The Division of Material furnishes the completed ship and supplies her stores, ready for the personnel. The Division of Personnel then furnishes the officers and men necessary to man the ship. The Division of Operations uses the product thus furnished to perform the duties assigned to the fleet. The Division of Inspections examines the results attained in the various fields of naval activity and reports directly to the Secretary.

With the assistance of the Aid of each of these divisions, acting as the eyes and ears of the Secretary, the work accomplished has resulted in economy and efficiency. Economy is shown by the fact that the effective material strength of the navy has been increased without exceeding the current appropriations. Efficiency is shown by the facility with which the business of the department has been transacted.

The navy yard is a military establishment existing solely for military purposes. A part of the work—the largest part if magnitude be gauged by the amount of money expended—is industrial in its character, but not in its object.

But yards cannot be scientifically managed to the greatest advantage so long as the Secretary is hampered by lack of power to use the moneys appropriated to the best advantage. The yards must be organized and managed so as to promote military efficiency, and it is necessary that the yards produce results which will increase the military value of the fleet, for the fleet is the navy.

The problem which will have to be met when the Canal is completed and the fleet is spending six months of the year on the Pacific Ocean is the question of the consolidation of the navy yards. We are at present embarrassed by a superfluous number of navy yards, distributed along the Atlantic coast from Maine to Louisiana. This calls for a vast amount of money to be expended for maintenance, absolutely unnecessary to meet the actual requirements of the fleet. But nothing can be accomplished in the abolition of needless navy yards until public sentiment is aroused to the necessity of it and until it becomes so evident that local interests will be overcome by public interests in meeting this question on broad, patriotic, business principles.

Business principles have been applied to the navy, both ashore and afloat, in so far as possible. Radical changes have been made where the efficiency of the yards and ships would allow, and a progressive policy of improvement has been consistently followed thruout this administration.

Stores.—Consolidation of stores, simplification of accounts, separation of the accounting from the shops and its consolidation under one officer, increased accuracy in the reports of the cost of work, all these have had a part in the production of a more economical and a more efficient administration in the navy yards.

The same principles have been carried to the ships at sea, where all stores are

under the care of one officer, the general storekeeper of the ship. The different departments have been given a money allotment for stores, the amount of which is less than the value of the old allowance of stores in kind.

This consolidation of all supplies and the consequent economy in storeroom space, maintaining one stock of supplies under the custody of one officer, *in lieu of five stocks* under as many officers; the charging to the appropriation concerned with only such quantities of supplies as are actually used for the maintenance of each department and at the time such supplies are drawn for use; the separation of the stock of supplies and the accounting for same, from those actually being consumed; the consolidation and simplification of accounts; and the relieving of line officers of a great volume of clerical work which properly formed no part of their technical line duties; all these are changes which have wrought for economy and efficiency on shipboard and which indicate our policy toward a progressive administration, the ultimate aim of which is a high standard of production for an economical outlay of capital.

Gunnery.—The principles of scientific management have been known and practised in the fleet for years. Recently it has been the cause of the wonderful increase in the gunnery efficiency of the navy.

In the battle practices of recent years the competitive system has given remarkable results. Officers drill and train their crews; every man is carefully selected according to his physical and mental qualifications to do the duties at the gun; some are selected as gun pointers, some as sight setters, and others as loaders and plugmen. Each individual is tried repeatedly to see which is best suited to the job at hand. The result is that every man at a gun station is the man best suited in every way, physically and temperamentally, for his particular duty.

The study of the time element of certain operations has been going on for years, and a marked decrease in the amount of time necessary to perform these operations has resulted.

The first step was to make more rapid the work of each individual, making his movements as simple and easy as possible, and making them harmonious, so that there would be no interference. In order to obtain these ends, each individual was first made to go thru his work slowly, so that accuracy and perfection of each operation were obtained and unnecessary movements eliminated. This plan not only insured perfection of detail, but unconsciously to himself each man was training his muscles so that they would quickly respond to his call and so that he would suffer the minimum of fatigue. As perfection of detail increased, speed was sought for, and each man's work was carefully timed by stop watch.

Having trained the muscles and developed the skill of the individual, it became necessary to coördinate the work of the organization as a whole. Exactly the same methods were employed as for the training of the individuals, *i. e.,* each part of the organization slowly and precisely did the part of the work assigned it, and precision and ease of operation were attained.

Every detail was timed by stop watch; for instance, it required 2⅕ seconds to open the breech of a 12-inch gun; ⅕ of a second to put in primer; 3⅖ seconds to ram the projectile; 4⅕ seconds to ram the powder; ⅖ of a second to withdraw the loading tray, etc.

It is recognized that no man can work continuously during a long period, especially when under great mental stress, but that each man must have certain periods of rest in order to allow nature to build up what has been destroyed. In order to reduce the mental stress to a minimum, drills are held frequently, so that altho each man must at all times be alert, the method of the performance of the work becomes an ingrained habit, to a certain degree a second nature with the man, and no conscious effort of the mind is required to perform each operation. The functions of the different members of a turret crew are laid out so that even with the greatest possible rapidity of fire each man must rest during a given part of the operation of loading and firing a gun. For example, the trainer and pointer may rest their eyes while the gun is being loaded, the plug

man has no duty to perform while the pointer and trainer are getting on the target before firing, and while the projectile and powder are being loaded into the gun, etc.

Having attained a high standard of speed in accurate firing of one gun, the drills are extended to the whole broadside of ten or twelve turret guns.

The object sought is well indicated by the opening statement in the "Rules for Battle Practice, 1911," that "the measure of the battle efficiency of any vessel is her ability to deliver the greatest number of hits in the shortest possible time after the enemy is sighted, and with the least expenditure of ammunition."

The value of these methods is obvious. Not only do they serve to attain economically scientific performance of all work done, but, knowing the plans and details of any new vessel, they serve as a very exact guide to the number of men necessary to efficiently man and fight her.

As a result of practical management the hitting power of the fleet at long ranges has improved remarkably.

Conditions have varied from year to year, due to weather experienced at different practices, changes in target area and changes in methods used. Within the last two or three years the target has been very much reduced in area, but even with this handicap, in the spring battle practice of 1911 the 12-inch guns doubled the scores made at the practices only six months previous.

With the improvement in gunnery has also come a marked improvement in preparedness for battle. The rules have been so drawn as to direct thought toward what may be expected in an engagement. Casualties have been simulated and unexpected difficulties have been thrown in the way by the officers controlling the fire, so that they may be able to meet all obstacles.

The methods for making the "approach" when about to engage in battle have been studied and developed as a result of the various battle plans laid down by the department for the actual firing of the guns.

None of our vessels are now "smooth water" ships. The department has demanded that the training should be conducted on the open sea, where the rolling and pitching require the most expert skill on the part of the gun-pointers in order to hit the target. Further, it has been assumed that the ships may have to fight in the most unfavorable weather, and, therefore, the rules for the battle practices have required the ships to train for fighting in rain, snow and foggy weather, and generally when conditions are most unfavorable and adverse. For these reasons, the officers and crews are prepared to meet whatever may come up, and the ability to handle successfully the casualties that will probably be met in action is one of the most important parts of the training.

In the competitive battle firing, the conditions are made just as severe as those that would obtain in actual action. The firing vessel has no knowledge of the course, speed and distance of the target vessel. All the information she has is that somewhere on the horizon, at a distance of ten miles or more, is a column of smoke which marks the target vessel at which she is to shoot. She steams toward it at her best speed and opens fire at whatever range she chooses, but the value of hitting at long ranges is vitally imprest on her by the amount that is added to or subtracted from her score for the shots that hit beyond 12,000 yards, or under that mark.

The whole firing is over in four minutes, and the ship has no other chance to make good, if she fails in this. No excuses are accepted for failure of guns to fire, for breakdowns of any character, or for any faults of the personnel or material.

As evidence of the value of competition in gunnery, a comparison is made with the fighting efficiency of the vessels during the Spanish-American War and at the present time. The percentage of hits in 1898 was 3½, with the large guns firing about once in five minutes at short range. The percentage of hits in the recent firing at the San Marcos was 33⅓, the range being 10,000 yards and the present rate of firing a single 12-inch gun being about ten shots in five minutes. This rather overestimates the work at Santiago and underestimates the work today. A roughly drawn compari-

son shows that we are about 1,200 times better in gunnery efficiency than we were at Santiago.

The policy now for the competitive training for battle is that it shall begin on the date of commission, and no excuses are accepted for being unprepared should the department at any time require the ships to fire at a day's notice.

Engineering.—All ships in the fleet are now placed on a competitive basis in engineering. This has resulted in such improved efficiency and economy that the Atlantic fleet, for instance, now burns less coal per knot in steaming at 12 knots than it did at 10 knots speed during the much discussed trip around the world. Ships now in almost all cases continue to exceed on full power trials their trial trip speed, and with greater economy in coal and oil.

These results were produced by the most energetic attention to duty, in which losses and wastes were eradicated in boilers, engines and auxiliaries, as indeed they must be if a ship is to take a creditable stand in the engineering competition. A constant stream of detailed information on design and operation exists between ships and the department, and between department and ships, so that officers may readily benefit by the experience of others; that good organization and sound practices may become standardized; and that methods of doubtful expediency may be brought under widespread discussion.

That such interest in engineering matters would result in a general desire on the part of the officers for more complete engineering education is easily foreseen. The establishment of the School of Marine Engineering at Annapolis, as a post-graduate course, in collaboration with the Engineering Experiment Station at that place, opened up this avenue and met with instant recognition from the service. This school, only three years old, has already proven its value, and its bearing on engineering efficiency is assured. Aside from its educational value, the Engineering Experiment Station, also at Annapolis, has resulted in large economies.

Nor is the practical engineering education of the enlisted force forgotten, there being schools for machinists and coppersmiths at Charleston, S. C., and at San Francisco, an oil-fuel burning test plant and school at Philadelphia, and an electrical and radio-telegraph school at New York.

Repair initiative, resulting in a vessel's self-sustaining qualifications, has received great impetus during the last few years. Ships will never be entirely self-sustaining, this being limited both by necessary lack of large repair facilities and by the short periods of time possible to allow for repairs and alterations. Large savings in time and money in repair work are now the order of the day, and ships undertake their own repairs as a matter of pride and as a matter of course. The well-known resourcefulness of the American mechanic is a large element in this.

The United States Navy has every reason to be encouraged by its engineering prospects, and to feel assured that it is on the right track to efficiency. The duties and responsibilities of line and engineer officers brought about by the amalgamation enactment in 1899, which caused such wide comment and doubt in the naval world, at home and abroad, are accepted in our navy with enthusiasm. Already its results are said to be 25 per cent. better, measured in fuel economy, than those of one of the large navies; and in our own navy conditions have greatly improved, and furthermore, are constantly improving. That we are not distinctly in first place in advancement is probably traceable at present to our present national tendency to be behind in experimental and research work, in which the Germans notably lead; but that this feature is receiving attention by the whole country is well known, and great improvements along this line may be confidently expected.

Modern Management and Efficiency.—So-called scientific management is an evolution and not an invention. The pressure of competition and the growth of large corporations has forced a scientific examination of all business methods and naturally we have certain acknowledged experts in modern management who are fully acquainted with the theory, and some of the practice, of methods

necessary to produce both economy and efficiency in many branches of modern business.

There are two portions of the theory that are essentially new. The formation of a thinking or planning branch in the administrative body, one that advises and does not execute, and second, the direct instruction of the workman thru each motion that makes up his daily work.

The formation of a staff that advises but does not execute was first worked out in the armies of the world, and the German General Staff is an example of it in the highest state of efficiency. The failure of this principle can generally be traced to attempts to combine staff and executive functions.

I have endeavored, as said in the beginning of this article, to create such a branch in the Navy Department at Washington by taking four experienced officers as aids to advise me in questions of administration of the Fleet, of the Personnel, of the Material and of Inspection, the four natural divisions of the military work of the department.

The aids plan and advise me, and the approved plans are executed by the commanders of the fleet and the chiefs of the several bureaus.

The second portion of modern scientific management is the instruction of the men so as to save unnecessary work and promote efficiency after a careful consideration of the operations performed by the mechanic, rather than leaving each mechanic to use his special tools as developed by his own skill from inherited knowledge. This, with the bonus system for good work, I found had already been adopted in the fleet. The planning board was represented by the Director of Target Practice and Engineering Competitions, and the men were carefully selected in accordance with the requirements of their work, and all unnecessary motions were eliminated. The work in turrets and in engine and fire rooms was scientifically studied and increased efficiency resulted.

A board of scientific management experts, on visiting the fleet, stated that the battleships were the finest examples of scientific efficiency that they had ever seen.

The adoption of like plans in the navy yards presents many difficulties. The nature of the work there is largely repair work and the time of completion may be at times more important than the cost of the work. I have given and am giving the problem much consideration, and the yards will eventually be brought to a state of efficiency as high as is consistent with military necessities.

To further this I visited England, primarily for the purpose of examining into the systems of organization and methods employed in the English dockyards and in the leading shipbuilding establishments of Great Britain.

I found at the works of Messrs. Vickers, Limited, at Barrow-in-Furness, a most efficient and simple system of management, containing a hull division and a machinery division.

The greatest percentage of increased efficiency seemed to have been attained by broad effects in systemization and in securing the cheerful co-operation of workmen toward best results, thru proper recognition of their initiative and more efficient effort. In order to obtain still greater coördination, I have appointed a Director of Navy Yards to advise me on all such questions.

The present practice of giving sea-going officers experience at navy yards and in shops aids materially in keeping the vessels of the fleet ready for action, for this experience enables them to make repairs to machinery, etc., with the ship's force, and thus keeps ships away from the yards, except for the larger repairs. This principle of giving officers shop experience in navy yards on the machinery they care for and keep in repair at sea is of great importance, because in time of actual war ships must be kept on the battle line and kept in working order by their own officers and men. No battleship can then be spared from the fleet.

Economy is a much abused word; it is often used as a synonym for parsimony; light expenditures are frequently called economical expenditures. No idea could be further from the truth. True economy is almost synonymous with efficiency.

The closer competition of modern business forces scientific management on

all who would not be left behind in the race. The employers must submit to greater overhead charges for the sake of increased economy in other directions, and they must deal fairly with their men in the matter of a bonus for extra work accomplished; and the employees must agree to give up their claim that all of a like rate in the same trade must receive equal compensation.

In conclusion I quote the following from a preliminary report of the Committee on Labor of the House of Representatives, made on the 24th of June, 1911: "If energy is wasted in any form in our industries or in any of the departments of the Government, the elimination of the conditions producing the waste would be beneficial alike to employer and employee, to the Government and to the people. Their elimination would have the same effect as the introduction of a labor-saving device. No protest has been received from any source against the elimination of wasted energy."

WASHINGTON, D. C.

A Vision of Brotherhood

BY ELAINE GOODALE EASTMAN

THRU chaos and black night
The human brute climbed slowly toward the light;
Up painful steeps unknown
He climbed—and struck his climbing fellow down!

Fast locked in wasteful war
Dark men and fair both scorned and scorners are.
And the unlessoned eye
In every stranger sees an enemy.

Ev'n Christians seek to prove
By deeds of mortal hate, Immortal Love!
Beneath the tyrant's rod
Ev'n martyred childhood lifts pale hands to God!

O brave young century, moving with the beat
Of mighty wings and restless, eager feet
Toward hights unscaled and lands unseen before–
We shall not climb, but soar!

At last the common cause, the single goal;
At last the human soul
Flies free, and knows among the striving throng
One race, one faith, one tongue!

The harlot's hollow laugh, the convict's shame,
These soil my snowy fame;
I feast no more, hearing the hungry call,
Nor boast another's fall.

Now quake the mighty on their seats of power,
Now strikes the people's hour;
Love spreads her wings, and Adam's scattered brood
Fare home to brotherhood!

AMHERST, MASS.

Unrest and Progress

BY DAVID STARR JORDAN, LL.D.

President of Leland Stanford, Jr., University.

THIS is a time of social unrest, of criticism, of change. It is for the thinking men of today to decide in what degree unrest is wholesome, to what extent insurgency is progress. In the eddies of the world great currents may move backward as well as forward. There is a saying in Texas that "in every round-up the finest steers are on the outside of the herd." The men of action are on the outside of society, moving in our direction, but they do not always realize which way the herd is going. It was recently said of the greatest of modern journalists that in his zeal for action he sometimes found himself "leading the rear rank backward." The currents of unrest do not all set to the front. There is a self-confidence in all forward movements, and in some others, which takes them out of the categories of "unrest." It is the fashion today, however, more than it ever was before, to regard civilized society as effete, outworn, tyrannical; to consider the institutions our fathers have built up as mere temporary scaffolding; and the Constitution, of which the Americans of the past have been so proud, as a maze of paper agreement, respected only when it favors some man's ambition or gives play to some man's greed. We are all radicals when we are young—a bit set in our ways as we grow old. An eminent Senator has said that the difference between an insurgent and a stand-patter is mainly the difference between forty years of age and sixty.

And to my case-hardened mind, as I look back over the years in which I have been a part of a democratic constitution, I cannot help thinking that both are fairly good. Society is the best that its constituent units will allow it to be. It couldn't be any better so long as it is made up of such people as you and I. It can never be very much worse than we want it to be. In our mutual relations, we get what we give. In words attributed to the great Croker, "New York will always get what is coming to her." In the long run every community gets the social organism it deserves. The Constitution of the United States may have its defects and its limitations, but the evils of society are not due to these. They are not due to any defect in political or economic machinery. They are the faults of human nature, and the cure for them is found in better men.

Those who study these matters with the cold eye of science find that the old laws of living still hold good. In the struggle of life, there is still a premium placed on faith, hope, charity; on industry, frugality, sobriety, self-denial; self-restraint and persistence; on self-devotion and idealism. The old virtues of old times still remain first among the elements of effective living. With all the inventions of the most ingenious of all the ages, there is no way of getting around the primal demands of self-control and self-devotion as means of working out one's own destiny or of helping in the destinies of others. The same old forms of cement still hold society together. Kindliness, tolerance, justice, mutual help and mutual forbearance, with veracity of thought and action, hold the same values they have always held. To overcome the world, one must know the world as it is. Every man, whatever his natural gifts, whatever his temperament or his tendencies, must build up his character along the old lines that make him worth while to himself and to his neighbors.

Our fathers dreamed of a society which should know no permanent gradations of rich and poor, of wise and illiterate, of noble and humble, of rulers and of servants. That all men should be alike, or even permanently equal, is of course no part of the scheme of democracy. Equality before the law, equality of start, is the sole demand of democracy. Permanent equality can exist only when all are alike at the bottom of the pit. That all men should be so free so far as outside constraint is concerned goes without saying. The natural limits of freedom are

found in the need of like freedom for others. No man is free to throw another into slavery. No man's right in a democracy goes so far as to wrong another man. Chains and slavery there must be so long as the weaknesses of human nature exist. But these chains in democracy should be of our own forging and should bind ourselves alone. The children of the republic should be all free-born. A wiser training and a purified society will one by one strike off the fetters that bind us today. There is no method of taxation, no adjustment of capital, no system of distribution of earnings that will give freedom to a man who is a slave to drink. His tyrant is on the inside and will be with him wherever he goes. There is no system which will give the unskilled laborer the rewards of the man who uses his brains as well as his arm. A bushel of coal and a bucket of water will do the unskilled laborer's work and requires little more supervision. The unskilled laborer is an anomaly in a land of freedom. He exists because we are not very far from the dark ages even yet. He exists because Freedom herself has not yet overtaken her insistent duties.

There is no system by which men stupefied by alcohol can take an even share in the man's work of today. It is our fault that boys who might be free grow up sodden and ineffective because society cannot protect itself against an evil and profitable traffic.

I once attended a meeting in Los Angeles, in which a well known and impassioned orator depicted the sad conditions of wage-slaves, with especial reference to some decision which had riveted their chains. If I remember, it was a judge in Nebraska who did this. But the real author of these chains was not hard to find. The whole room was rank with the odor of beer and whisky. Doubtless wage-slavery makes for drink. But drink in its turn makes for slavery, and no man can be a free unit in a free nation so long as his mind is kept dull with alcohol. He cannot expect to master the problems of life unless he is master of himself. Democracy makes no guarantee to any man. It gives him opportunity. That is what democracy means. It is trying its best to give each man a chance to rise, tho men still bearing the chains of medieval oppression are crowding on us faster than we can take care of them. This, too, we must remember. There is no chance to rise when there is no chance to fall. The paternalism that guarantees support to mediocrity, ignorance and vice, does this at the expense of intelligence, soberness and frugality.

In our days, in our land, it is really not boasting to say that ours is the triumph of democracy. All triumph is relative; the whole story is not yet told. And yet on the whole thus far it is a good story. Never before in any broad nation was government so wise, so frugal, so considerate, so fair, so intelligent, so just. It is growing better with each generation. It is for each of us to help to make it better. There is plenty of room for improvement, for it fails, as you well know, in every one of these regards. Here and there it is stupid, wasteful, blunt and unjust. Its great success, its great extent bring out its defects in glaring prominence. It is not strange that there are such defects. For the defects in human nature appear in all human institutions, most of all in continent-wide effort at co-operation. The force of money, the insistence of greed, the waste of dissipation, the dead weight of ignorance, the resistance of prejudice, the display of sheer vulgarity, the tendency toward spendthrift waste and display, are all manifest in every day's governmental transactions. They must each be met and fought by men.

The conflict is no easy one. It will go on for generations, so long as ignorance is possible and greed profitable. The forces of evil will assume as many forms as there are kinds of men. The final remedy does not lie in changing our machinery. The strength of machinery, as James Watt once demonstrated, lies in its simplicity, and ours is not complex. The national Constitution could doubtless be improved in spots, but these improvements have no primary importance. No change in ways of doing things is going to get rid of the party hack, the demagog, the grafter, or the time-server. Political progress is not bound up in the referendum. The recall is only a confession that our first choice is made

in careless haste. The initiative is an assertion that our representatives fail to represent us. If so, that is our own fault. Perhaps they represent us too well. Its value is local and temporary to dislodge some petty tyrant, but the day's work of a great nation demands more adjustable machinery. If we want better representation we must have better units. To this end, there are only two ways—to bring in better men, or to insist on better morals and better training for the men we have. Better men do not come for the asking. The glorious wars of the past have thinned out the breed. We must look after better environment to help out those we have. The future of the nation is written in the schools of today. No man is a good citizen until he can take care of himself and has something left over for the common welfare. If economically and morally alike he is a non-producer, he is no fit member of a democracy. He is a public nuisance. If he earns no more than his keep, rich or poor, he is an economic nonentity. If he exerts no influence for good, he is a moral nonentity. To have nothing and to rail at those who have is not in the line of social progress. The last ten years in America have been marked by a great swell of moral uplift. The source of this movement has been in better education. It is not broken and dissipated on the reefs of politics. It is not the result of the appeal of any popular leader, tho popular leaders have been credited by it. It is not affected by the results of any elections. The tides of the sea do not depend on securing a majority.

Casting aside the figure, we are getting rid of the old politics because we know something better. The welfare of the people, the welfare of the world, these are replacing the old motives of party victory. This is in its final analysis the work of the public schools. The schools stand for order and co-operation. They know no classes, they feed no class consciousness. The movement for better government has its root in the universities. The State universities of the West are turning out a hundred men wise and interested in governmental affairs today, where there was one twenty years ago. The other universities do the same, but the activity is keener in the West. The West is younger than the East, more boastful and less self-satisfied. We are examining our precedents, we are counting the cost as we never did before, and we are holding in ever higher valuation the lives of the nation's children. It is not well for the nation's future that little ones should perish uselessly. It is not well for society that a child should grow up dwarfed or perverted, if it once held the possibility of something better. "A generous education should be the birthright of every child of the republic." "For a man to have died who might have been wise and was not, this I call a tragedy."

The movement of democracy cares nothing for party triumph or defeat. The issue of elections has no permanent significance. It all rests with the character of the citizens. At all times, in all nations, the quality of government depends on the quality of the individual men and the degree of intelligent interest they give to public affairs. "Eternal vigilance is the price of liberty." Eternal vigilance will give us the government we deserve by helping us to deserve it. The better the government we have already, the more easily it may be improved. It is a maxim of biology that only highly developed organisms can show defects. The more highly organized, the greater the play of selection. There are no complaints of social unrest in lands of "morning calm," if such lands still remain. Where effort begins, there begins the possibility of failure. But in the regions most ruled by justice, intelligence and patience the efforts to make over society are most plausible and persistent. It is not easy to change the basis of society. Our relations are partly the result of past conditions held together by tradition, partly the resultant of the forces of today. Tradition helps determine the external form, the inner forces, the essential reality. External forms may be changed if we like. They count for little. But internal realities change only with the individual social units. Take any particular scheme for remodeling society, with any distribution you like of rewards for effort; in a few months conditions would slip back again, substantially as they are now.

The greedy would be greedy, the weak would be weak, the strong would hold an influence proportional to their momentum, their weight multiplied by their velocity. The dangers lie in weakness and inadequacy. It is the weakness of the weak, rather than the strength of the strong, from which spring tyranny and injustice. The weak invite oppression. The tyrant falls before the greater power of intelligent co-operation. But the weak cannot co-operate. It takes strength to grasp the real art of democracy, peaceful co-operation, and peaceful compromise. To grasp this idea is to be no longer weak. Violence is not strength. The cause that demands violence is a lost cause. The very essence of democracy is justice through public opinion. We hear much of the evils of personal greed and tyrannical combination in the affairs of America today. We see that in the past we have given away empires, with no thought except to make our resources quickly accessible. Those to whom we have given them are exploiting them in their own interest and not in ours. We have carelessly allowed privilege to become property, and franchise for the public good to lapse into personal ownership.

We see a great nation held up for private exploitation by manufacturing combines, by ship-building syndicates, by those who make money out of rumors of war and out of artificial pumped-up patriotism.

But the last word is not yet said. It is never said. Millionaires, corporations, trusts, courts, congresses, presidents, armor-plate syndicates or yellow journals, any or all of these may vex us. It would be strange if they did not. But they have no power over us if we deserve to be free.

The republic is greater even than any of its parts—greater than the sum of all of them. If the people are really injured, they will sooner or later find out what hurts them. When they find this out, they will devise their own cure. Our friends in Europe criticise us for various things, especially for our lack of respect for law and for our tolerance of graft. They take our word for it and we cannot blame them. But our regard for law depends on how law is made, and as for graft the fact that we do not tolerate it makes its presence conspicuous. If we tolerated it no one would hear of it. In the Old World as a rule the problem has been met by legalizing every evil that seems to defy control. In that way the great lords, landlords, war lords, sea lords and money lords have come into existence and into control. Our strength in America lies in making and keeping all wrong illegal. Therefore we cry out against ills, real or imaginary, in a fashion Europe finds it hard to understand. But we achieve our purpose at last. The wrong is righted sooner or later, after which we pass on merrily to the next evil on the list.

Mr. Dooley says that when an American finds a mosquito in his house, he goes after it hammer and tongs, breaks the fiddle over it, steps on the dog, and scares the cat; but, at last, he gets the mosquito.

The Englishman, on the contrary, after futile efforts, accepts the situation, calls his home Mosquito Lodge, and imagines that the insect sings "God save the King!"

And we may add that the more people there are who study the nature of insects, the sooner will the mosquito be caught, and the more readily can we turn to other reforms.

Among all the changes in our machinery of democracy which we urge so stridently today, the one that seems to me most important is one that gets least attention. I mean the short ballot. By the short ballot the people select those men they know and can trust, and to these they leave the choice of all the other servants. The others have charge of the expert needs of society, of exact knowledge of law, finance, economics, education, engineering and sanitation. With the long ballot the voter throws away his liberty by choosing men from a long list of names of unheard-of people. If he knows nothing of them, his choice is not a free man's choice. The most he can do is to trust his party nominations, and these are made under conditions not likely to inspire confidence. The worst man the public will stand has often been the standard of party conventions. To escape from such necessity is the purpose of the open primary, but every ra-

tional advantage of the primary is lost in the long and complex ballot. There are two elements essential to the success of democracy—the free choice of leaders and the need of expert service. In the main business of government, justice, economy in expenditure, sanitation, education and peace, the only good service comes from thoro training. The best men that can be had are none too good; and the best cannot be chosen at a party caucus, nor can they be retained except on condition of freedom of action and permanence of tenure. Party fealty bears no relation to good government. The legislator should be chosen freely by the people, and should return freely to the people for confirmation of his acts. He is the guardian of the liberties of his constituents, not their expert servant in matters demanding finer discrimination. By the short ballot these leaders and representatives should be chosen. The choice of expert service is a function of the executive with the advice and approval of the people's chosen representatives.

To elect an engineer, a librarian, a superintendent of schools, a judge, a general, by popular vote, is to pick out your expert servants in the most unscientific way possible. It is to perpetuate the "cult of incompetence," which some writers have held to be the peculiar burden of democracy. "It is not only the eminent man," says Faguet, "who is the thorn in the flesh of democracies, but every form of superiority whether individual or collective which exists outside the state or government." "The body of the people elects only representatives who are counterparts of itself, and such are necessarily and always its dependents." "Clearly," continues the French writer, "it is almost impossible for the democracy if it means to survive to encourage efficiency; nay, it is almost impossible for it to refrain from destroying efficiency." But the people can encourage efficiency by realizing the need of it. They must do it if the republic is to endure. This is only possible thru the spread of intelligent education. If the liberties of the people are not conserved, that is, if men are not equal before the law, equal in the start in whatsoever race they run, it is an infringement of their liberties. To care for the primal needs of liberty, the people must choose representatives of their own kind.

But there are needs more subtle than those of liberty, and these can be met only by men of thoro training in special lines. The art of administration means the choice of such men. The very existence of democracy depends on the possibility of such education. The appointing power on the one hand is as essential as the voting power on the other. When the people really believe that this is a nation worthy of good service they will get it. It all rests on the degree of our intelligent self-esteem, and the estimate in which we hold our own public affairs. If public service is a joke, its proceeds will be the spoils of the victors in politics. If our estimate of ourselves is a noble one, that fact will react on all parts of the public service. That work for the people may be well done is shown in a hundred ways, by the administration of scientific bureaus, by the control of State universities, by the building of the Panama Canal—one does not have to look far for illustrations. One does not have to look far to find the reverse where our political life is bound up in "doing politics." Along some such lines as this must come the settlement of the labor problem. To respect one's work and the end to which it is performed is to give it dignity. To give it dignity is to guarantee honest performance. And a righteous patriotism would indicate that there is no higher function than the service of a free people.

The educated man and woman in every community are trained to efficient service. Whether public or private service is a matter of minor importance. All efficient private service becomes sooner or later public. Efficient service is as essential in a democracy as equality or freedom. The three are all of one piece. In the long run, they cannot be separated, for democracy means popular education, and popular education bears its natural fruit in special training. Rising intelligence demands better service, and the demand grows steadily more and more insistent.

Palo Alto, Cal.

Seeing Sounds and Hearing Colors

BY JUNE E. DOWNEY, Ph.D.

[Miss Downey, who occupies the chair of Psychology in the University of Wyoming, has been engaged for several years in the experimental investigation of this curious transposition of sensations and was one of the first to explain the important part it has played in the formation of literary style.—EDITOR.]

ONE of the most interesting of individual variations that the modern study of human nature has reported is a curious confusion of the senses. Odd as it may seem to the more matter-of-fact individual, there are many persons who actually see sounds or odors, or, more rarely, hear pain or light. It is the latter who can tell you the pitch of the crescent moon; they alone may hear the fabled music of the stars, or rejoice in a musical geometry that gives them the differing pitch of square, triangle and circle.

Tonal vision, that is, the hearing of light or color, is very rare; not so colored hearing, of which there are almost as many varieties as of persons who report it. For some the coloration extends only to voices or to Christian names. They may compare the strawberry colored voice of one friend with the mottled Easter-egg voice of another; they may ponder the relative merits of a blue name or a brown one. Vowels alone may be colored, and perhaps, differently colored when spoken in one voice than when spoken in another. Agreement there is none as to their proper coloration; the letter *a*, for instance, may range from the black given it by the poet Rimbaud to green or orange. For other persons music, and only music, is colored. The pitch of a note may give it its hue or the instrument on which it is played may determine the tint. Low-pitched notes may range from purple to black; high-pitched ones from azure to white. Or each instrument may have its own color; white for the harp, orange-gold for the horn, mauve for the violin. Orchestral music may become a veritable cascade of rainbows.

If, perchance, one gets form as well as color from music, the possibilities of arabesque are multiplied. A teacher of design, of whom I have heard, attends concerts in order to have sight of new patterns. She explains that a sonata, for example, gives her a border fresco; the chatter at a tea-party may, on the contrary, be seen as a design for a book-cover.

Sometimes analysis by color is very serviceable. The complexion of a complex note may be equal to a mixture of the hues of the partials just as the color of a word may be composed of the tints of the letters. By throwing his attention upon the attributes of color so aroused, one man who distinguished pitch with difficulty reported that he learned how to tell various musical intervals. He could discriminate harmony from discord by the blending of colors which took place with consonance.

Tastes and odors, as well as sounds, may become colors. I am acquainted with a young man whose mouth is flooded with luminous pink whenever he tastes wintergreen. Peppermint and cloves, on the other hand, taste a dark, rough green; anise gives a beautiful black. This young man is greatly distressed when food tastes a color different from the color it looks. Yellow peppermints are for him an abomination, as are pink teas also. He, too, uses his taste-colors in discrimination and is able to identify exceedingly weak solutions by the colors they arouse. But solutions giving the same color puzzle him. Thus, he is unable to distinguish between a solution of quinine and one of red pepper, because both give the same orange-red taste.

Odors, when seen, usually surround with color the scented object or fill the space from which the odor proceeds. But in one peculiar case the hue of the odor was seen by the person who experienced it on his own forehead!

Pain may change into sound. We are

told, for example, of a psychological toothache; one, that is, that you can hear; and I have myself experienced a symphonic earache, one that most considerately translated itself into orchestral terms. Touch, in turn, has its visual analogies. There are bright touches, just as there are sharp whispers.

What is probably the most curious case of sense transposition on record has been reported by Professor Pierce, that of the young lady who tastes sounds. Imagine, if you can, a roast-beef voice and then a banana one. Think of being tantalized, as the young lady confest she was, by being forced to listen to a lecture when hungry!

Theoretically, it would seem that a confusion of any two senses might occur, but as a matter of fact, not all the possible exchanges have been reported. No case is on record of odors shifted into sound, altho I have heard a little girl speak, as does Huneker, the critic, of fragrant music.

An anticipated sense transposition, but one which has not yet been reported in unambiguous fashion, is the change of touch into color. If such a shift can occur, and if it did occur in the case of a man born blind, would he then be able to see colors thru his finger tips? An interesting speculation. Persons born blind have learned, of course, to distinguish textures by touch and to call them by color-names, but such touch discrimination does not imply a true seeing of color. Again, cases have been reported of persons blind from birth who, after restoration of sight by an operation, immediately recognized colors. Had they previously seen such colors by touch? It is extremely improbable. The cases reported are of blindness by cataract, and there is good authority for the statement that persons suffering from such obscuring of the lens are able before an operation to obtain faint glimmers of light and color. Hence the possibility of one sense actually doing duty for another remains undecided.

A curious fact relative to these sense-transpositions is that while, usually, the substitution occurs in a systematic and uniform way as a regular occurrence, there are also many reports of a merely occasional substitution of the sort, as of the symphonic earache, which, unfortunately, was a unique experience. Altho not subject to colored hearing, I have seen, on awakening from a deep sleep, an early morning whistle as a dark, purple-black streak against the window curtain. Fevers, apparently, may cause such substitutions of one sense by another; certain drugs also have the power of effecting such exchanges. Gautier it was who said of hashish that it enabled him to hear the noise of colors.

But what explanation has been attempted of these shifts of sounds, odors and tastes into colors, or of colors or touches into sounds? There are certain psychologists for whom the occurrence offers no problem at all. There is, they insist, no change from one sensation to another, but only an unvarying arousal of a given association by a given object. The child taught from a brightly colored alphabet book may therefore always associate certain colors with certain letters. Why should not, for any of us, the odor of a rose appear pink and that of a violet blue simply because of the constant association of the color with the fragrance of the flower? Such interpreters hold that colored hearing and tonal vision are cases of ordinary association thru experience.

The difficulty in accepting such a view lies in the fact that seldom besides do our images assume the vividness of genuine sensations and behave as do the latter. I may indeed think green when I hear *a* pronounced, but ordinarily I do not see *a* as green. Moreover, these associations are so early found, so unchangeable, so beyond control of the will. Above all, the tendency to colored audition or tonal vision appears to be an inherited tendency, a fact which points to nature, not experience, as its source.

Other investigators, finding that children more frequently than adults experience synesthesia—the technical name for the arousal of a secondary sensation by way of a first—hold that the experience is rooted in a reversion to a more primitive nervous condition before clear-cut sense distinctions had been evolved. But why, we may ask, should the reversion be so frequently to color? Others believe that synesthesia is caused by privileged pathways in the brain, a draining

of nervous excitation say from the auditory to the visual area. Or it may be caused by undue elasticity of the arteries in the brain.

Leaving the explanation of what we may call true synesthesia to the future investigator, we may ask the relation between such experiences and the imitation of them in literature and criticism. One of the curiosities of modern criticism is, in fact, found in the tendency to transfer sense-adjectives from one province to another. We hear of color-harmonies, melodic lines, frosty music, fragrant nocturnes, noisy colors. To quote from Huneker, writing of a Chopin berceuse: "Modulations from pigeon egg blue to nile green, most misty and subtle modulations, dissolve before one's eye, and for a moment the sky is peppered with tiny stars in doubles, each independently tinted." Or from Swinburne, writing of Blake's early poems: "They have a fragrance of sound, a melody of color, in a time when the best verses produced had merely the arid perfume of powder."

Modern French poetry is full of such sense confusions. Rimbaud writes the "Sonnet of the Vowels"; Baudelaire sings of the correspondences of perfumes, colors and sounds. English poetry makes less use of such an effect, altho Swinburne uses visual and auditory terms interchangeably. He describes "song visible" and sings of "Light heard as music, music seen as light," and of "Fine honey of song-notes goldener than gold."

What shall we say of such transfer of sense-adjectives? Is it a sign of degeneracy of style, a straining after artificial effect? Is it a sign of a new florescence of language, a language evocative of delicate emotional effects? Or is it rooted in actual experience, so that we may conclude that poets and writers of imaginative prose are, more than the everyday man, subject to a malady of the senses?

To attempt, first, an answer to the last question. Scientists who have investigated synesthesia have, from the beginning, been interested in the question whether poets and musicians are particularly subject to true synesthesia. This question they have answered, in general, in the negative. Most of the instances from French poetry can be explained as a deliberate manipulation of effects rather than as an unconscious confusion of sensations. French poets and critics have indeed almost adopted "*audition colorée*" as a canon of art, but, even so, most of them distinguish true from artistic synesthesia. The first is purely individual, random, erratic, of no significance for art, whose appeal must be universal.

Among English poets, Swinburne's poetry suggests the possibility of the poet having been subject to tonal vision. Probably, however, he exchanged his terms with deliberate attempt. Shelley's use of sense comparisons is even more evidently deliberate. He often, for instance, uses odor in an odd way. He describes the pealing of hyacinth bells as an odor within the sense and compares songs to homeless odors. But his comparisons are too varied, too definitely instituted, to indicate a true confusion of sound or light with odor. He loved odor passionately, hence his attempt to render even his verse fragrant. He delighted in rich imagery, hence he may question of the azure and silver of a shell, "Looks it not like lulled music sleeping there?"

Keats, peculiarly susceptible, it is said, to the delights of touch, makes frequent use of touch and taste analogies in his poetry, but usually with conscious intent. There is no subtle confusion, except perhaps in his famous line, "Kissing with dazzled lips her starlight hand."

William Blake, at once painter and poet, often expresses his thought oddly in terms of vision, as when he writes, "And all thy moans fly o'er my roof, but I have called them down." It is to Blake we owe the wonderful phrase, "blind hand," a phrase full of meaning for those who see thru the finger tips, and who consequently appreciate the reality of that most terrifying and ruthless blindness, tactual blindness—the unshielded and untender intimacy of contact with the Unknown.

Exploration of English poetry resulted in the discovery of one case of true synesthesia, one that is even attested by the poet. Poe, who frequently in his poetry speaks of the sound of the coming darkness, confesses in a footnote to "Al Aaraaf": "I have often thought I

could distinctly hear the sound of the darkness as it stole over the horizon." What a psychologist Poe would have made!

Altho there is little evidence that poets are peculiarly subject to true synesthesia, particularly as a systematic occurrence, it is possible that they do experience such exchanges of sense-qualities occasionally during the fever of inspiration, whence a subtle confusion may originate, wherein the soul, dazed by excess of light and sound and perfume, may be caught up in a mighty wind of sensation that blends all together.

In any case, imaginative writers seem to enjoy sense-analogies more than does the matter-of-fact person. Shall we, therefore, condemn their confusion of sense adjectives as fantastic, as a regretable attempt, according to Nordau, to confound sense-qualities whose distinction has been a long and laborious process of evolution? But how justify such condemnation when the development of language has been by way of similar process of transferred meanings, delicate comparisons? What of the transfer, generations since, of touch and taste adjectives to all manner of conditions, so that the word sweet may fitly describe anything from a young girl to a strain of music, and the word soft apply alike to a man and a feather-bed?

One is limited then to finding literary synesthesia significant of an attempt to render into language delicate emotional overtones. It seeks, as it were, for emotional synonyms. A visual and an auditory sensation may have the same affective toning, hence one may be substituted for the other. This confounding of sense qualities is in a way a return to more primitive conditions since it is a surrender of knowledge to emotion. But the power of poetry lies just in its suggestiveness, its mystery.

Most of us have an emotional vocabulary. Colored hearing may be comparatively rare; not so colored thinking. One of every ten persons makes use of color concepts. The months of the year, the days of the week have each their emotional tone which may be concretely symbolized by color. Experiment has shown, indeed, that colors have a perfectly definite emotional effect. Red is the color of war and of love; it is exciting, strengthening. Yellow, the color of sunlight, of amber, and of ripened grain, is the color of gayety. Blue is the hue of distance, of reserve; green the color of hope as of spring; purple the symbol of royalty and of pride. Why not speak, then, of "love's rosy memories," of "ebon music," of "azure calm"?

But if there is a poetry of color, there is also a poetry of odor, a fact which justifies the description of music in terms of fragrance, altho actual experience of exchange of sound and odor has not been recorded.

The stylist insists, further, that there is also a poetry of the vowels and the consonants; that the vowels have each a definite coloration, constant and uniform, having no relation to the variable colors seen objectively by those suffering from nervous difficulties; that the consonants give form and outline. They tell us that *a* is white; *o*, red; *e*, with the labials and with *l*, blue or green; *u*, black. Immobility is sketched by the use of *d*, *t* and *z*; vagueness and distance given by the use of *b*, *p* and *f*. Certain consonants deepen, others weaken the coloration of vowels. In the prose of the ordinary writer there is, indeed, a complete neutralization of color effects.

We find no difficulty in accepting the last statement. As to the rest,—well, at least, this new departure in criticism is most interesting.

LARAMIE, WYO.

Practical Eugenics

BY REV. CHARLES M. SHELDON

[The first International Congress of Eugenics, recently held in London, has aroused public attention to the supreme importance of preventing the degeneration of the race thru unfit marriages, and practical people all over the world are asking what can be done about it. The following article by the wide-awake Kansas pastor is worth attention because it is based upon his own experience. At the Kansas Congregational Conference last May a hundred ministers voted unanimously in favor of similar action. Hitherto the part taken by the clergy in marriage has been mostly formal and ornamental. Now they have it in their power to make marriage more truly Christian.—EDITOR.]

THE minister had been talking it over with his wife, and they had finally agreed that something must be done about it.

"I think I will announce next Sunday from the pulpit that hereafter all couples presenting themselves for marriage must show a certificate of health from a reputable physician. I am convinced that this is the first step toward a much needed reform."

"Yes," said his wife. "But I foresee certain objections on the part of our young people. You know, John, that such a radical step will probably provoke a good deal of opposition."

"I suppose it will," the minister sighed. "'The world is out of joint; O cursed spite, That ever I was born to set it right.'"

The next Sunday morning the minister was preaching on "Social Betterment." At the close of the sermon he made this announcement:

"I hereby give notice to this church and parish that hereafter all persons presenting themselves to me for marriage will be required to furnish certificates of physical and mental health, signed by a physician. I believe that this is a reasonable requirement and that it is not only justified but demanded in the interests of social betterment."

Some of the congregation had been asleep during the sermon, but every one, especially all the young people, were wide awake when he made this announcement.

After the service was over and the minister had come down from his pulpit to greet the people, among the first to meet him was one of the young men active in the Sunday school and young people's societies.

"I was glad to hear that announcement, pastor. And I want to be one of the first to congratulate you on this step. You know I have the promise of your services next June, and, thank God, I believe I am physically and mentally sound, and can furnish my physician's certificate."

The next person to greet the minister was one of his deacons, who simply said:

"I have been hoping for such a movement for a long time. The reason I never urged it was because I believed it ought to be begun by ministers who did not need urging, but had convinced themselves."

The next persons to greet the minister were a young couple whom he had baptized when children and received into the church from the Sunday school.

The young man said, speaking with modest but manly directness: "We are ready to meet your conditions, pastor. And we want to tell you that we have talked the matter over and believe in your position most heartily."

Three doctors in the parish also stopped to extend their congratulations, and a number of school teachers and business men.

On the way home the minister told his wife how his announcement about health certificates had been received. She seemed a little shocked when he mentioned the frank statement made by the young man who had said that the matter had been discussed between himself and the young woman who was going to be his wife.

"Do you think that is quite proper, John?"

"Well, why not? How about all those physiological laws in the Bible which the Jews were commanded to teach their children? Why should our young people be so falsely modest that they rush

into marriage without knowing some of the most vital conditions of it? Don't you think we have been too careful about some things and too careless about others?"

"Perhaps you are right, John. Indeed, I think you are. But will all this tend to make marriage too mechanical, too—well, too much like a bargain? Or will it not rob love of its spontaneity and romance?"

"Not a bit," replied the minister, stoutly. "A good deal of the romance the last century has gushed over has been foolishness and worse. We should not be afraid to know the sacred facts of our bodies."

"Before marriage?"

"Ay. Before rather than after."

During the week the minister's mail began to increase. It doubled the next week, and the week after he was embarrassed and had serious thoughts of a printed form to answer questions and objections. He also had a new experience, one that his wife had not warned him about.

Monday morning two young people he did not know presented themselves at his study in the church. The young man had his license in due form and said he wanted to be married in time to catch a certain train. The following dialog took place:

"You know my rule about a health certificate?"

"No, sir. What's that?"

"I shall have to ask you and the young woman each to present a certificate of health signed by some reputable doctor."

"Oh!" from the groom.

"My!" from the bride.

"Yes," from the minister.

"But isn't the license all right?"

"Yes."

"From the probate court?"

"Yes."

"Doesn't that entitle us to get married?"

"Yes."

"Then if it's legal, can't you marry us?"

"I can, but I require also a health certificate."

"But—what will we have to do? We haven't time to——"

"Wait. Come out here, William."

This from the bride, who drew the bewildered groom out into the study entry.

The couple soon returned, and the young man said:

"What will be the expense of the certificate? Who pays for it?"

The minister did some Olympic thinking.

"I will."

"How much time will it take? Where will we have to go? We have only three hours."

"Just a minute."

The minister turned to his telephone and called up one of the doctors who had congratulated him on the stand he had taken Sunday morning.

"Can you examine a young man if he comes right down to your office?"

"You can?"

"What will be the expense?"

"All right. Thank you. I appreciate that. I'll send him right down."

Next he called up one of the women physicians in his church and asked the same questions relative to the examination of the young woman, and apparently he received the same answers.

He turned to the waiting couple and said:

"You can get down to these offices and back here inside of an hour, and it won't cost you a cent. I said I would pay for it, but each one of my doctors, who are members of my church, has offered to do this service gratis."

There was a whispered conference between bride and groom. Finally the young man turned a somewhat confused face to the minister.

"Well, we hardly think there is time. But we will go downtown and if we can make our train we will come back."

They went away. At the end of an hour the minister 'phoned the doctors to inquire if the examinations had been made.

No one had applied to either physician.

The minister's memory was good and he remembered the names on the license. So when he read in the paper next morning the list of marriages by the probate judge he recognized that of the couple who had come to the study. He talked the incident over with his wife.

"You lost a fee yesterday morning, Mary. The probate judge has it."

"Do you think you will have any more weddings, John?"

"Well, I have two couples who have asked for my services. I am sure of them."

"But won't your health certificate drive all the young people who are outside of the church to get married by a justice of the peace or a probate judge?"

"Perhaps. Then we shall have to ask the Legislature to give us a State law. Here is a place where church and state must act together."

"Meanwhile——"

"Meanwhile I shall demand the certificate and get as many other ministers as I can to do the same."

"And what shall I do for pin money?"

"I will raise your salary."

During the last three months, up to the present writing of this article, the minister has married six couples, four from his church and two from outside. All of these young people were willing to take the examination and all of them presented clean bills of health. The doctors who had promised to make the examinations free entered into an agreement with the minister at his own request to accept a part of the marriage fee for their services. In the cases of the minister's own young people they insisted upon paying for their own examinations, and exprest their deep gratification at the results of them. The first health certificate handed the minister is being kept by him as an interesting and valuable document.

The falling off in marriages during the three months has been about one-half of the usual number. The minister's mail has increased to about fifty letters a day. Meanwhile the doctors and lawyers in his own congregation have begun to agitate for a State law. They will get it. And the minister's wife will have to get her pin money from her "increased salary." But why were the first young people who applied to the minister for marriage unwilling to obtain a health certificate? Why should any one who is fit to marry refuse to be told so by a doctor?

TOPEKA, KAN.

Lost Child

BY CHARLES F. LUMMIS

THE little girl that I used to know—
Tell me, what can have gone with her?
Here she was, but a jiff ago—
All my yesterdays shone with her.
Tiny feet that I taught to walk—
Wavering first little steps to me;
Balancing, laughing, eyes aglow,
Proud and safe when she caught my knee.
Baby lips that I tuned to talk—
How the dimples beset her so!
"Who is this that I sort o' found,
Puttering, pattering, projecking 'round?"
"Papa's comfy, that's who I be!"

Tall and straight as a sapling spruce,
Now over daddy's head she sees.
But can she fathom the mysteries
Daddy hugs in a tired old heart?
What can she measure of "What's the use?"
How can she know what herself she means—
Half-way immortality lent;
All the tenderness, all the smart—
To the grizzled chum of before she went,
Prophet that loved her before she came?
New thoughts flutter, and other scenes
Beckon her—and I cannot blame.
But only one thing in the world's the same,
Never shaken and never spent—
Daddy's love for the babe she meant,
Love for whatso she e'er can be;
Change, nor sorrow, nor very shame
Can hide my child from me.

Leave her, best, to her own device,
Let her follow her conscious feet;
Wilful now they can go alone,
For the paths of youth are sweet,
And life must school its own,
And Daddy can wait.
Some day, sure as the homing bird,
Sure as the sun on the glacier's ice,
Safe as sorrow and fixt as fate—
Some day so shall her heart be stirred
And a blind old man that waits afar
Shall hear the little feet—and a word:
"Why, Daddy! And here we are!"

Come she proudly, or come she bent,
Queen or outcast, or flushed or gray—
Time is only—another day;
Love—that it may be lent.
She will be but my babe again;
All behind and between shall be
Naught and naught as a dream of pain—
When she stands again at my knee.

LOS ANGELES, CAL.

Hayti: Misunderstood

BY ELSIE CLEWS PARSONS

[Mrs. Parsons, the author of "The Family," etc., has just returned from a brief pleasure cruise to Hayti and we are pleased to give her impressions of the little West Indian republic to our readers.—EDITOR.]

TWO men, Spenser St. John and Napoleon III, are perhaps more than others responsible for Hayti's questionable reputation. Vanity suffers, otherwise the ill effects of a bad name are likely to be exaggerated—for a man or for an island—and until recently to be stigmatized for cannibalism or labeled "pays des barbares" probably made little real difference to Hayti. But now that foreign capitalists have begun to build a railway, to raise bananas, and to take part in revolutions, it is important—to the capitalists at least—to understand Haytian character. To take a revolution too seriously or to take the wrong side in it, to ignore amenities cherished alike by African and Frenchman, to expect a man's work of a child, can result only in friction and antagonism.

Undisciplined by modern economy, the Haytian's ideas of time and space are as uncertain as those of a child before he begins to learn "to tell time" or of a woman who has never learned the points of the compass. Even in the ports we quickly learned to add an hour or more to native time estimates, and in our three days' ride from Cap Haïtien on the north coast to Gonaives on the west we never once got an answer in *kilomètres* to our "how far?" questions.

A like uncertainty in measurement shows in the natives' sense of money. Whatever you give, you are asked for more. There is no cheating about it, nor dishonesty—the French priests, always your kindly hosts inland, tell you that a mule laden with sacks of gold could journey from end to end of the island unrobbed. They tell you, too, that you yourself will never be in any way molested and that Haytians carry pistols and *machetes* merely as you wear a ring or as a boy cherishes a penknife. I certainly knew of one gigantic *machete* doing the work of a pocket knife. It was loaned to me to peal an orange as I pulled in my horse by the wayside cockpit to talk a little about the coming week-end amusement.

This money greed is, I suspect, a kind of childish wanting more of something that you like and so asking for it without thinking at all of the service rendered or the donor's limitations. In native trade I surmise like disparities. At any rate, long journeys are made to the weekly markets for buying or selling in ridiculously small amounts. But, as on the West Coast of Africa—or anywhere else, in fact—village markets (and city department stores) are for more than mere trade.

So, too, an immense amount of labor is put into scolding a neighbor or getting a little produce from the fields or drinking water from remote streams or a few pailfulls of sugar from cane or a change of government—just as a child will quarrel with another or try to reach a high shelf or fit things together or circumvent its nurse regardless of cost in time or energy.

Of this maladjustment the municipal electric light plant at Cap Haïtien is a shining illustration. Dominating all night long the other noises of the town—in unlit towns the drums and the dogs hold their own—it also costs $88 a night to illuminate streets too unkept for use.

Then, too, there is the wonderful *citadelle,* seen as part of the mountain outline southeast of Cap Haïtien, a conspicuous example of reaching for the shelf. Built in the second decade of the nineteenth century on a peak of rock so high and steep that the hauling up of a single cannon seems a herculean job—and there are dozens and dozens of them—wrecked by earthquake a few years later, it stands today a massive sepulcher for the children of its builder, King Christophe, and a colossal shed for crag-loving goats.

On the other hand, alike in Hayti and

in the nursery, there is little inclination to squander energy on order. Children have to be taught to put things into their place, and Haytians let their docks rot away, their bridges tumble down, their roads turn into ruts and holes, without concern. At Cap Haïtien, on two sides of the main *place*, still stand the ruins made by the earthquake of 1842. The cathedral occupies a third side. On the fourth stands another ecclesiastical building, built since the earthquake, and in its garden a ruined wall still lingers. In the harbor of Port-au-Prince, the capitol, sunk close to the docks, three or four wrecked boats lie undisturbed.

Very characteristic are both town streets and country roads. Street paving is going on at present in Port-au-Prince—two Americans being the *concessionaires*—and while we were there they were speeding up in anticipation of Secretary Knox's visit, one of the many effects, let us hope, of his tour of amity. Elsewhere streets are unpaved, sometimes impassable to wagons (and we saw them in the dry season, when they were only rutted and mud-caked), always receptacles for refuse and the resources of pigs—like the streets of New York sixty years ago. The country road illustrates individualism in another way. However wide it may be and however traveled, it is full of single trails. You ride in it single file, just as you do crossing river or mountain, and you meet long strings of panier-laden donkeys and men and women (mostly women, and mostly as topheavy as the donkeys, for, as on the West Coast, the women are the traders and the carriers), and all are almost always walking one by one.

The highway was probably made by the French a hundred years or so ago; the trails in it are being made day in and day out by the descendants of West Coast Africans. Everywhere we find the same juxtaposition. Champagne is served to an honored and thirsty guest —in the morning and tepid. In need of porter or guide, you turn to guard house or sentry post, the lounging place for the uniformed boys of the town. Sons or daughters are sent to be educated in Northern schools of technology or in French convents—on Government graft. The gayest of aristocratic *Pierrots* and *Pierrettes* dance to music very like what you heard the night before at a dance of the *bas-peuple*, a West Coast dance. While the *"ancien délégué"* and Celestina, amazon and priestess, are being burned in effigy by the most amazing of *Mardi gras* masks, masks which outdo the East and West Side urchins on Fifth avenue at Thanksgiving, you are entertained at tea-party and *musicale*, the daughters of the house giving you native dishes (a concession to you as a *"touriste"*), singing French songs and playing piano and violin for you—all done too graciously to make it possible to explain to the charming old general of a host that burnings in effigy were more alluring than tea-parties, being rarer. Moreover, the general very much objected to your seeing at all what to him was such a vulgar show.

In retrospect, after further acquaintance in official circles, I am somewhat surprised that the burning in effigy was permitted by the authorities. It has precedents in "civilization," to be sure; but the present year-old Government is scrupulously "progressive" and reformatory. Grafting is to be punished—as a certain finance commissioner must have realized when he fled for protection two months or more ago to the German Legation. Haytian trade is to be built up —to the cost of the resident Syrians. Vaudoux drums may not be bought or taken out of the country, and in at least one *arrondissement* the *commandant* has even undertaken to suppress the *"services"* or Vaudoux rites entirely—at least he said so, and stuck to it even when I remarked that that was a pity. The costly gunboat which floats boilerless in the harbor of Port-au-Prince, a grotesque monument to the ante-revolution Simon administration, is to be sold —if possible—and the President is to have a new boat to carry him to the remoter ports of his government. How much better off he will be in it than his much-traveled Northern colleague in his Pullman car!

Progressive as he is, President Leconte and his friends won out in their revolution through anti-railroad, anti-American argument—also no doubt by having more cartridges to shoot off in the air than the Simonites. (Although

it is rumored that any shortage of ammunition might have been made up by American enterprise, and from the gossip we heard I suspect that while President Taft refers to Mexico in urging stricter neutrality laws he may also have Hayti in a corner of his mind.) The campaign cry was that the Americans were stealing land for their railroad—it is still stated in high circles that the railroad contract was too favorable to the Americans, leniency, however, that is said to have cost the company $20,000, including an automobile according to some, a tiara according to others, for Célestina, Simon's diverting daughter—and that some day the Americans even planned to bring back slavery. No wonder that if you were overheard talking English as you rode through the country you were always hailed and sometimes a little jeered at for a "*Macdonàll*," the name of the first railroad *concessionaire* having become synonymous in the North for hateful American.

How deep the anti-American prejudice may have sunk it is hard to know, for in your own case, a smile, a "bon jour, monsieur," or "madame," a joke, seem to destroy it at once. Given time for other amenities, a visiting card, a compliment, a drink, and native courtesy are unbounded. As a farewell attention at Cap Haïtien the little boy of one of our kind friends brought on board to us ten doves for pets—or food, as we liked. The choice almost led to a quarrel—our only one—but the bird fanciers prevailed and for the rest of the cruise the doves sat happily two by two in a converted bottled water crate. Their sweet-mannered donor, by the way, was one of the boys, big and little, who had taken part some months before in the revolutionary outburst at the Cape, a night's shooting up of the town which resulted at least in bringing his father back from exile in St. Thomas. One day my horse went lazy and, at the suggestion of our mutual acquaintance, a Syrian trader, the general and planter with whom we were taking our *déjeuner de midi*, gave me his own horse for the rest of the day's journey. Entering a Northern port after sunset—"which is against the rule"—because, out of gasoline, we could not spend the night at sea, a telegram from the President secured us anchorage and immunity from an enormous fine.

Easy for us, it would be easy for all Americans to be liked by Haytians—after a little consideration. Putting it into a formula, one might say: Play with them as Frenchmen, work with them as Africans. As it is, we are not playing with them at all, and we try to work with them as if they were grown up and in a temperate zone. But you cannot "hustle the East," or Hayti, without mutual disaster, and remember, O ye immigrant New Yorkers—bank presidents and clerks, railroad engineers and contractors—that Hayti is a nursery, noisy, disorderly, quarrelsome, wayward, uncritical, living from day to day, full of easily hurt feelings, untrained to foresight or to self-control, where the only discipline has been that which the older could give the younger children. Do not step into it like an exacting, unsympathetic father, inopportunely curt or cajoling, exasperated by its shortcomings and impertinences, ignorant of its ideas and feelings and even of its dialect; but rather like a mother who understands, even if she does not speak, "baby talk" (even if you don't speak Creole, for Heaven's sake learn French), who joins in its dancing and "dressing up," who neither ridicules nor overrates its "secrets," who keeps her temper because she is teaching others to keep theirs, who never sets impossible tasks because she has gauged the capacity of each, who does not bribe the unruly or the weak of will to be "good," who neither scolds nor nags, and who is rarely scornful and *never contemptuous*.

If you can't all be mothers—it *is* asking a good deal of you—at least be ethnologists, learn the language, and—go to sleep yourselves two hours in the middle of the day.

New York City.

Literature

Eugenics

THO we may never have a science of history, we shall have the problems of history treated more and more thoroly in the scientific spirit. Every attempt to apply scientific method and scientific results to problems of human society should be welcomed as of help in replacing chaos with order. The problem of the *composition* of human societies is one of those in which speculation and pious wishes have for long served as the chief sources of ideas; at the present time the tendency is to introduce an element of fact. Dr. Davenport's book[1] offers an excellent means for becoming acquainted with the scientific method of attacking certain types of complex problems, as well as a broad survey of the kinds of facts that are of significance in the field of eugenics. There is a short introductory chapter on general definition and aims, and another on the main facts of heredity as they have been determined in recent years thru experimental studies with plants and animals. The bulk of the book is devoted to an enumeration of human traits whose modes of inheritance are fairly well understood, with diagrams of family histories to illustrate these modes.

In regard to single traits, the biologist is prepared to make prophecies. Most of the traits whose mode of inheritance can be predicted with a fair degree of accuracy are in the nature of defects or abnormalities, such as color-blindness, supernumerary digits, deaf-mutism, hemophilia, etc. Certain indifferent or desirable traits, however, are also known to be transmitted in accordance with definite laws; among these are eye and hair color, mechanical skill, mathematical or musical ability, style of handwriting and others. A complete family history will enable the student of heredity to predict for certain of these traits with as much assurance as the chemist has in foretelling the outcome of combining specified reagents.

The problem of eugenics today is chiefly concerned with the fact that the individuals possessing certain undesirable traits—those that "cause a disturbance and an expense of time and money quite out of proportion to their number in the community"—are increasing at a more rapid rate than are the normal members. How to check the increase of undesirable population and at the same time to increase the desirable "germ plasm" is a problem for the statesman; the student of heredity can tell us what specific traits "breed true," which ones are "dominant" or "recessive," and what degree of correlation there is between given traits.

The book by Mr. and Mrs. Whetham[2] lays no claim to being scientific in the narrower sense. The ghost of Herbert Spencer's notion of the government as excelling in proportion to its inactivity peeps out from between the pages of the book, altho the authors recognize that there is much to be done. The hereditary transmission of traits, desirable as well as undesirable, is accepted on the basis of historical experience rather than as a result of biological analysis, and it leads to a rejection of democracy because democracy means "equality." The fine records made by certain ancient English families and the general inefficiency characteristic of most of the South American republics are used as arguments for the superiority of the "pure race" and the aristocratic classes generally. They assume that relative income is proportional to "efficiency" and that "efficiency" is a heritable trait. They deplore the diminishing birth rate in certain classes of the population, identify in another place high birth rate with biological soundness, and in a third place attribute to the influence of the Catholic religion the relatively stable birth rate in

[2] HEREDITY AND SOCIETY. *By William Cecil Dampier Whetham and Catherine Durning Whetham.* 8vo, pp. viii, 190. London: Longmans, Green, & Co. $2.

certain countries. Truly, the problems of state are complex—too complex.

The three little books edited by Rev. James Marchant[3] are intended for the general reader. The problems of race regeneration are presented in a definite, clear-cut manner by Havelock Ellis and by Arthur Newsholme, the former as a biologist and the latter as a statistician; both are interesting and decidedly readable. Dr. Saleeby, in presenting the various methods of race regeneration that have been proposed, follows his usual manner of classifying and subdividing his topics so that the reader easily gets a survey of the field and a notion of the relations of the various items; but he has made a commendable advance over his earlier adherence to a rather crude conception of "natural selection" in social progress.

In the Chicago University lectures on *Heredity and Eugenics,*[4] the present status of the study of evolution and heredity is presented most acceptably to those who have an intelligent interest in such matters. The five lecturers naturally overlap at many points, since no attempt was made to correlate their material except in the assignment of specific topics to each; but the repetition is of the kind that must help the reader. Professor Coulter gives a broad survey of the problems in their historic setting, and introduces the lay reader to the biological concepts used in the later discussions. Professor Castle's lectures on "The Method of Evolution" and "Heredity and Sex" are made up of material already published in his "Heredity in Relation to Evolution and Animal Breeding," reviewed in these pages February 22. Dr. East presents considerable matter on inheritance and breeding of plants, including a great deal from his own experiments. The longest chapter in the book is by Professor Tower and gives an excellent account of the work of DeVries with the evening primroses and of his own work with the potato beetle. The application of heredity to human problems is presented by Professor Davenport in the last two lectures. Most of the material is the same as that printed in his volume mentioned above, but having been presented in lectures to mixed audiences, will in some ways be more satisfactory to the general reader. The illustrations and diagrams thruout the volume are excellent, some of them not being easily available to the reader in other books.

Political Science and Economics

It might be said of Professor Moore, as a student once said of Lord Acton, that his lectures are like pyramids—the point standing out clear and distinct; down below it the vast, subjacent mass of knowledge. There are few scholars in this country who reason so lucidly or who have such resources of information to draw upon. In his lectures on *Four Phases of American Development,*[1] which were delivered at Johns Hopkins University last year, some old and controversial questions are discussed with refreshing originality. Drawing support from the history of our territorial expansion, Professor Moore insists that the acquisition of our insular dependencies did not mark any new era in American policy, no "breaking at last from the fettering past," as a poet phrased it at the time; "we were merely following a habit which had characterized our entire national existence." He also shows, from a review of our relations with England and other countries, that the American people are not, as they like to believe, "perversely and incorrigibly peaceful," and that they have by no means held consistently to the principle of arbitration. The most interesting of the lectures is the one which considers the origin and development of "imperialism," or, in other words, the great enlargement of the powers of the Federal Government, which began with the Civil War and which has asserted itself so notably in connection with the Monroe Doctrine, the Panama Canal and interstate commerce. The war itself might have been avoided had it not been

[1] Four Phases of American Development: Federalism, Democracy, Imperialism, Expansion. *By John Bassett Moore.* Baltimore: The Johns Hopkins Press. Pp. 218. $1.50.

for the fanatical abolitionists of the North and the obstacle to compromise which was raised by the Dred Scott decision. At an earlier time a fair settlement might have been reached "by any three intelligent and disinterested men whose minds were not biased by partisanship."

It should be said, by way of correcting the impression which the title of Prof. Frederic J. Haskin's *The American Government*[2] is likely to make, that this book deals exclusively with the national government and considers little more than its administrative functions. There is nothing about parties and elections—nothing, that is, except a short chapter on "National Political Campaigns," which seems to have been thrown in accidentally at the end of the book as far as possible removed from the chapter on the President; and the thirty-odd pages devoted to the houses of Congress seem either out of place or quite inadequate. Mr. Haskin's real object has been to describe the various departments of the Government and the bureaus attached to them. He has tried to show in a concrete and therefore vivid way just what duties fall upon the people's servants, from the President down, and just how those duties are performed. That the presentation is accurate may be gathered from the fact that each chapter has been read and approved by the President, a Cabinet officer or some other high official. Even if this were not the case the author shows his familiarity with the subject by his easy command of illustrations which add to the reader's enjoyment and elucidate difficult points. He has everywhere brought his information abreast of the most recent changes. No doubt he becomes at times a little too statistical and a little too ready to measure things by standards of bigness and cost; his chapter on the Panama Canal gives point to this criticism. But, in spite of such defects, there is nowhere else so useful an account of the national administration or a treatment that is so well calculated to appeal both to the college student and to the general reader. The twenty-four photographs include the Roosevelt lions, the printing of a Presidential message, the files in the Patent Office, etc.

Economics and political science, long maltreated by the historians, are beginning to come into their own in secondary schools. Burch and Nearing have written for high schools a manual[3] along the lines of what they call "the newer economics" which is sure to attract the attention of teachers. Barren theory is reduced to small proportions, tho given its just due, and such questions as conservation, labor, protection, transportation and socialism assume first place. The teachers of economics in Chicago have put aside the textbook as the guide and have prepared a systematic syllabus of economic problems designed to serve as the working basis for classroom discussion.[4] When their "case-book" of materials is published, as promised, the combined volumes ought to provide an excellent method of stirring the class to discussing concrete questions—always a thing to be desired by teachers. From England we have a new manual[5] by Prof. S. J. Chapman which is more conservative in presentation than the American works, in that it follows the traditional lines of economic theorizing and takes small notice of "practical" matters.

In political science for colleges no new treatise has appeared, but Professor Gettell has issued a collection of readings[6] aptly selected to illustrate the topics of the text which he published last year. Two new books on civics for high schools, by Foreman and Garner, are now available. The former has abridged his "Advanced Civics," which appeared a few years ago and was favorably received by teachers.[7] Professor Garner has written a fresh new work,[8] which, on account of its stress on the dynamics of government and the newer devices, such as the direct primary, the initiative, referendum and recall, will doubtless find a welcome among teachers who are weary of tabulating the Constitution.

Four Volumes of Verse

On a smaller canvas than in his more ambitious volume, "The Masque of the Elements," and so with a nearer outlook on his theme, Herman Scheffauer does fuller justice to his remarkable powers as a dramatic poet of the Browning type. A dozen ballads of the sea and of frontier life show him possessed of the true swing of the sailor as well as of the savage mood of the pioneer explorer. In the fine poem, *Drake in California,*[1] which gives name to his new volume, there is a good deal of human nature in its eagerness to seek the unknown, well balanced against the English yearning for home—a novel theme wrought out in a bold sea vocabulary of the poet's own choice. How passion may tear the heart, and how the heart may resent the tearing is well noted in "Mary of Milrone," and in "The Ballad of the Battlefield"—a ballad that should take front rank with the skirmishers in the attack now on against the strongholds of our various English, German and American warlords. From the dead on the field of battle comes the bitter cry:

"Ye makers of war and your masters, take the curse re-arisen in me,—
Take the curse from the lips of my lovèd one, and the curse of the millions to be!"

The red hands must be dead hands, the red cheeks must be gray.
Yesterday all red with life, white with death today.
Ye on whom sorrow doth fall,—
Judge three and be judges of all,
For their red hands must be dead hands, their red cheeks must be gray."

Mr. Clarence Urmy[2] gathers various verses singing the praise of the Far Western hills, valleys, and old Spanish towns of California, all in their mellower home life. His California finds itself a well developed community, up in the arts, music, and fine garden culture. It has no savage reminiscences of the "49's," no dallying with the strenuous activities of the mines or the hoarse-throated den of the gambler. For the poet troubadour song still has place. The key to his mood is best found in such ballads as "An Old Guitar"—a delightful thing which one would like to quote, if space allowed. We give instead a stanza from his invocation, which may serve as the menu of the feast he offers:

"Troubadours, come sing again
To the heart of hearts of men;
Come with arms heaped full of roses,
Wreath and garland bright with posies,
For we need your fragrant lays
In these dull and sordid days."

In these same "dull and sordid days," Mr. Wilfrid Wilson Gibson, whose little volume, "Daily Bread," was lately noticed in our columns, finds a life[3] by no means "bright with posies." His muse still haunts the shadows of the world where sad pictures of the concentrated Ibsen type may always be found. His unadorned verse is vivid enough—all the more intense in its vividness perhaps for the absence of the softening quality which makes even the bitterly tragic helpful in hinting at some possible way out of the dark. While the moral is driven home, the bitterness may be driven in.

A scholarly rendering of a great Italian master is Mr. Ezra Pound's *The Sonnets and Ballate of Guido Cavalcanti*[4]. The author does worthy service in the interest of the student of verse, both in his interesting introduction and in many of the translations of Cavalcanti's work, whose fame, according to Dante, was bruited even in the lower world. We say "many of the translations," because the translator comes up sometimes flat against his own theories. Thus, he tells us of his poet that "we have in him no rhetoric, but always a true description, whether it be of pain itself or of the apathy that comes when the emotions and possibilities of emotion are exhausted." And further, he says that "all our ideas of beauty of line [in drawing] are in some way connected with our ideas of swiftness or easy power of motion, and we consider ugly those lines which connote unwieldy slowness in moving." Let us see how he applies his dictum to Cavalcanti's verse. Here are the closing lines of the beautiful sonnet: "Io vidi gli occhi dove Amor si mise":

[1] Drake in California. Ballads and Poems. *By Herman Scheffauer.* London: A. G. Fifield. 2/6.
[2] The California Troubadour. *By Clarence Urmy.* San Francisco: A. M. Robertson. $1.
[3] Womankind. *By Wilfrid Wilson Gibson.* New York: The Macmillan Company. $1.
[4] The Sonnets and Ballate of Guido Cavalcanti. With translation and introduction by Ezra Pound Boston: Small, Maynard & Co. $2.

"Dal ciel si mosse un spirito in quel punto,
Che quella donna mi degnò guardare,
E vennesi a posar nel mio pensiero,
E lì mi contar si d' amor lo vero,
Che ogni star vertù veder mi pare,
Sì come fossi dentro al suo cor giunto."

How simple, natural and straightforward is the great Italian's verse. How ornate and far off from simplicity is the rendering into English:

"The instant that she deigned to bend her eyes
Toward me, a spirit from high heaven rode
And chose my thought the place of his abode
With such deep parlance of Love's verities
That all Love's powers did my sight accost
As tho I'd won into his heart's midmost."

A rendering more clearly allied to the author's mood is to be found in Sonnet XXVIII—"Un amoroso sguardo spiritale." Yet here also the translator should have seen the faultiness in his translation of lines 12 and 14:

"Di farne a lei mercè giammai non tardo."
"Che un po' di pietà non fusse noia."

which, in his rendering, become

"Then do I give her thanks and without retard."

and

"Why this first pity doth no annoy."

In the first line there is no excuse for the extra "and," and no simplicity or beauty in the phrase "without retard." In the second line a syllable is lacking and "this first pity" is an unhappy substitute for "un po' di pietà."

Grandma. By Elizabeth Lincoln Gould. Philadelphia: Penn Publishing Company. $1.

The heroine of this story, which is hardly a novel, is sixty-nine years old, but on the whole she is quite as highly idealized a character as the typical heroine half a century younger—a little too good to be true, so far as our observation goes. When she leaves her rural New England home to go "to take care of" a daughter-in-law with nerves and a fashionable apartment house variety of home, one fears for the first few chapters that her creator is going to make the banal mistake, by way of contrast, of representing everybody in New York as too bad to be true. But with the packing off to the South of the nervous daughter-in-law, whose neurasthenic ills are distinctly not of the sort to be soothed by thrifty Yankee mothers-in-law with a passion for making up their own beds, both Grandma and the reader have an opportunity to meet some of the sane, intelligent and kindly men and women who thrive in fashionable apartments as well as in country villages. How Grandma improves the morals and digestion of her deceitful, sweet-devouring little granddaughter, elevates the business ideals of her son, penetrates a little the crust of silliness and selfishness incasing his wife, and in her social experiences is so successful that she becomes the belle of at least a limited portion of New York, is pleasant and mildly interesting reading.

The Early Court of Queen Victoria. By Clare Jerrold. New York: G. P. Putnam's Sons. Pp. xi, 392. $3.75.

Nothing that has previously appeared about Queen Victoria throws so much light on her character, her family, and on the status of the English monarchy at the time of her accession as is thrown by Miss Clare Jerrold in her *Early Court of Queen Victoria.* Miss Jerrold gives a most vivid picture of the young queen, with all her girlish faults of temper and education and with all the charm and the strength of character that she showed thruout her long reign accentuated in the girl of eighteen who succeeded the somewhat unpleasant and highly unpopular monarch, William IV. Miss Jerrold shows the people and influences by whom Queen Victoria was surrounded in the earlier years of her reign, the many drawbacks and disagreeable features of the young queen's life, the hard work exacted of her, and the suspicion and disloyalty of the nation, tired of Hanoverian sovereigns. She also shows the queen's delight in her dignity and position; her readiness to devote herself to her arduous duties—the more arduous because the jealousy of her people refused her the aid of a secretary; her clear intention to be queen and her refusal to allow herself to be the puppet of any one else. The story is also told of the two great mistakes which brought so much trouble on the queen herself and on others—first, the refusal to accede to Sir Robert Peel's demand that she change the ladies of the bedchamber, and second, occurring almost at the same

time, the tragic mistake which ended with the death of Lady Flora Hastings. The value of the book lies almost entirely in Miss Jerrold's delineation of character and in her vivid representation of the intriguing, the jealousy and the commonplaceness of the circles which immediately surrounded the young queen. The outstanding fact of Queen Victoria's accession—the one really remarkable characteristic which gave distinction to her character and redeemed Queen Victoria from utter bourgeoisie—was that it was Victoria who became queen. Not for one moment from the day of her accession did Queen Victoria consent to be a mere figurehead, while some power behind the throne was the actual sovereign. This fact was as unexpected as it was remarkable. The Princess Victoria had been brought up in strict obedience and subserviency to her proud and domineering mother; and in public had been seen only as the shy, quiet and unobtrusive daughter of the Duchess of Kent. Fortunately for the queen and for England, Victoria attained her majority at eighteen before the death of King William, and from the moment she received the announcement of her uncle's death she cut the leading strings and the duchess found herself without either the confidence of her daughter or any control over the child whom she had brought up with such strictness and so little indulgence.

American Addresses. By Joseph H. Choate, LL. D., D. C. L. New York: The Century Company. $2.

The light touches of a graceful orator, who, in after-dinner speaking, at times when other people are relaxing from cares, putting away the harness for a tumble in the playground, consents to give an hour of his own to their gambols for the sheer love he has of the sport. That expresses the mood of many of the twenty-two brief addresses included in Mr. Choate's late contribution to literature. Others are of a more serious character — forewords of welcome to men who have earned a nation's greeting, after-words to express the joy of a nation for a grand thing successfully done; sad words of parting for those who will some time come back, or for those who will never return. In all these it is the national note that is to be struck, a note to be sounded only by a man of national worth, skill and trust. Such a man Mr. Choate has more and more of late come to be at home and abroad—a man to say the last word of Farragut, Lowell, Phillips Brooks, Carter, Schurz, Florence Nightingale; a man to lay on the colors that mark the gulf between the Tweed ring and the Sanitary Fair folk. These addresses are things to lie on the parlor table for choice evening reading.

Vigilante Days and Ways. By Nathaniel Pitt Langford. Chicago: A. C. McClurg & Co. Pp. xvi, 554. With Portraits and Illustrations. $2.

Mr. Langford has given us a lively description of the lawlessness which prevailed in the Idaho mining camps during the early sixties and of the methods which the better element finally employed to stamp it out. The narrative opens with a picture of Lewiston, capital of the newly organized Territory and nearest accessible point by water to the gold placers which had just been discovered; a picture striking enough to reveal the author's thoro familiarity with his subject and the force of his simple, straightforward style. To this rather disreputable community came Henry Plummer, and his master mind formed the band of desperadoes who marked as prey every fortunate man in the mining camps. For years robbery and murder were their steady pursuits. It was organized brigandage; those who protested were shot down, and even if terror had not silenced opposition, the physical features of the country — the cañons, gulches and mountain passes—favored crime, and the long, solitary regions between camps gave excellent chances to waylay pack trains or coaches, with their precious freight of gold dust. Men finally came to understand that the bad element must be destroyed if they were not to destroy the good. Safety was found, not in the law, but in ways which were well calculated to secure the final vindication of the law. The vigilantes met violence with violence. Needless to say, the book tells of many and bloody crimes, but it tells also of stern retribu-

tion. Young men will not be encouraged thereby to embark on a life of brigandage, as some are said to have done out of admiration of the hero in Schiller's "Robber." Yet they will experience many thrills, for Mr. Langford has a dramatic sense and exciting themes. Perhaps he embellishes the facts occasionally, as when, with the genius of Thucydides, he gives conversations verbatim.

The Mind of Primitive Man. By Franz Boas. New York: The Macmillan Co. Pp. x, 294. $1.50.

In this interesting book Professor Boas combats "the naïve assumption of the superiority of the European nations and their descendants." Probably most of us make that assumption. We argue that since the white peoples have built up a higher civilization than other races, they must therefore have a higher aptitude, and that their higher aptitude must be due to superior physical and mental qualities. Thinking in this way of the European type, we have come to believe that every divergence from it represents a characteristic feature of a lower type. Professor Boas, after a scientific discussion of the evidence, comes to a very different conclusion. He says, for instance: "Hereditary traits, more particularly hereditary higher gifts, are at best a possible, but not a necessary, element determining the degree of advancement of a race." It will be understood that such theories have their bearing upon the race problems in this country and especially upon the negro problem, which is treated in the last chapter.

Literary Notes

....Stories of stage life have become distressingly common of late, but Miss Alice Gerstenberg's *Unquenched Fire* (Small, Maynard; $1.25) is above the ordinary both in interest and in morals.

....Many a fresh and happy expression of thoughts grown old in moral service appears in the volume of brief essays entitled *The War Within*, by John Edwards Le Bosquet, of Boulder, Colorado, published by the author.

....Russia is a country about which it is difficult to get recent and authoritative information, but the publication of *The Russian Year Book* (Macmillan; $5) will do much to remedy the lack. The issue for 1912 contains, besides the calendar (largely filled with church festivals), statistics of commerce, population and resources and much information for travelers, including customs and passport regulations and a vocabulary.

....Joseph Pennell is one of the few artists who are able to see the beauty that lies in tall buildings and machinery, and we are glad to know that he has been sketching the Panama Canal in a series of lithographs to be published by Lippincotts.

....A new volume of *Old Testament Stories*, prepared in accordance with the college entrance requirements in English and edited by Prof. James R. Rutland, for use in secondary schools, is published by Silver, Burdett & Co. (45 cents). The introduction is good, but the absence of all explanatory notes is a defect.

....For the purpose of encouraging in general readers a more lively interest in history and creating a taste for original sources, Mr. S. Harvey Gem, M. A., has written a pleasant and attractive study of *An Anglo-Saxon Abbot* (imported by Scribners) of the tenth century, Aelfric of Enysham, giving copious extracts in translation from the abbot's numerous writings. Many rewarding glimpses of the social and religious life in England at the period of the Danish invasions are thus agreeably given.

....Prof. J. Arthur Thomson's *Introduction to Science* (Holt; 50 cents) is not merely a convenient statement of scientific method and of the systems that have been suggested for the classification of the sciences. It contains besides a brief but very clear exposition of the theory of neo-vitalism which under the influence of such minds as Driesch and Bergson is now freeing biology from the trammels of a form of thought derived from physics and chemistry.

....The growing sentiment in favor of the use of school buildings and equipments in meeting the larger educational and social needs of community life will receive additional strength from the publication of *Wider Use of the School Plant* (Charities Pub. Co.; $1.25), by Clarence A. Perry. The author has collected materials concerning the successful experiments that have been tried in various cities in carrying on evening and vacation schools, recreation and social centers, public lectures and entertainments. Mr. Perry describes these activities and points out their salutary effect. His book will prove a valuable stimulus and guide to those interested in the advancement of education and the promotion of democratic ideals.

....*The New International Year Book* (Dodd, Mead & Co.) is an indispensable work of reference. Unlike some such annuals it includes the whole history of the year it professes to cover instead of leaving the latter half of December lost in fog. The large size of the page gives opportunity for handsome illustrations and maps. The volume for 1911 contains 800 pages, 47 full page plates and 8 maps. The articles are alphabetically arranged and fully cross-indexed.

....In two contrasting volumes of sermons, *The Mysteries of Grace* and *Reasons and Reasons*, our readers will learn how an English pastor of ability, Rev. John Thomas, of Liverpool, can discuss acceptably from the pulpit the great problems of Christianity, and on the other hand how very simply and helpfully a noted theological scholar, Prof. James Moffatt, of Oxford, can present themes touching the practical difficulties and incentives to Christian living. (Hodder & Stoughton; $1.50 each.)

....The revival of the art of pageantry is one of the most interesting esthetic movements of our time. It has been much written about and is beginning to be taught in our universities, but it is hard for those engaged in getting up such entertainments to learn how. In the new book on *Pageants and Pageantry*, by Esther Willard Bates (Ginn; $1.25), will be found useful, for it contains detailed directions and dialogs for five pageants: Roman, Medieval, Colonial, Mythological and Literary, and includes also general instruction and a bibliography.

....We are quite accustomed to restatements of religious thought in which attempts are made to square theology with modern science and utilize as far as possible scientific method and material, but the old forms are largely in evidence and the process of renewal often seems to have attained a stage where the results fail to satisfy either conservative or radical because of their hybrid nature. Rev. Francis Howe Johnson, in his new volume entitled *God in Evolution* (Longmans; $1.60), makes the theory of evolution the basis of his speculations and follows out its legitimate conclusions, shattering some time-honored conceptions and reconstructing the notions of God and salvation. The author is confident that by the surrender of such infinite attributes of God as omnipotence, some intricate and perplexing tangles may be straightened out, and that the adoption of a thorogoing evolutionary scheme will strengthen every pulse of theological thought. In an appendix the author gives an appreciative summary of the philosophy of Henri Bergson.

Pebbles

He.—Dearest, you're the goal of my affections.

She (removing his arm).—Five yards for holding.—*Harvard Lampoon.*

"I thought your father looked very handsome with his gray hairs."

"Yes, dear old chap. I gave him those."—*London Opinion.*

What has become of the good old play
In which the villain exclaims, "Hist! hist!"
And tries to smuggle the chee-ild away,
And the hero comes in and slaps his wrist?
—*Springfield Union.*

"The chump who wanted to see if the cigar cutter was sharp is not half on the level with the fool that attempted to buy fence rails at the post office."—*University of California Chaparral.*

Eyes of black, of brown, of blue,
Oh, I've suffered long for you!
Eyes of blue, of brown, of black,
Eyes—with hooks adown the back!
—*The Sun.*

Lawyer (to witness).—Did you say that an incompetent man could keep a hotel just as well as anybody?

Witness.—No; I said an inn-experienced man could.—*The Hotel Guide.*

QUELQUE WHISKERS.

W. E. Massey left a bunch of blue grass at this office Tuesday which measures three feet and four inches in length. It was taken from Tom Stevens, over in Woodland township.—*Lineville, Ia., Tribune.*

Maud Muller, on a summer night,
Turned down the only parlor light.

The judge, beside her, whispered things
Of wedding bells and diamond rings.

He spoke his love in burning phrase,
And acted foolish forty ways.

When he had gone Maud gave a laugh
And then turned off the dictagraph.
—*Milwaukee Sentinel.*

The other night we heard a father speak thusly: "William, your mother tells me that you must have a dose of castor oil before retiring tonight. It is your bed time now. Take your medicine and go to bed at once."

"But, papa! I don't wanta take no caster-oil!"

"You must take it. And immediately!"

"Aw, papa, Idowanter!"

"William, if you don't take that medicine, I'll put you right to bed this minute, without giving you a drop of it!"

William was so scared that he took it. That's the way to enforce discipline.—*Cleveland Plain Dealer.*

The Independent

Entered at New York Post Office as Second Class Matter
Publisher, Clarence W. Bowen
130 Fulton Street - - - - New York

A WEEKLY MAGAZINE FOUNDED IN 1848
One Year, $3.00 Single Copies, 10 Cents

Single copies over six months old, 25 cents. Postage to any foreign country in the Universal Postal Union, $1.75 a year extra; to Canada, $1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as those offered by any responsible agency.

An order for the change of an address should be received two weeks before the change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of the publisher's price any book reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with $1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. Even so, we cannot hold ourselves responsible for their return. Authors should preserve copies of their manuscripts.

Advertising rates will be furnished on application.

Mr. Taft's Acceptance

In his formal acceptance of the nomination made at Chicago, Mr. Taft felt that he must attack two political foes. But there is not much in his long address that Democrats can regard as an assault upon their propositions or policy. Their hostility to protection, their vetoed tariff bills and the demands of the Stanley Committee and their platform concerning Trusts are, of course, the objects of his criticism, but the greater part of the remainder of the address—except the review of his Administration's work and the defense of the Payne-Aldrich tariff—is aimed at Mr. Roosevelt and the latter's third party movement. At the end we find that, in the President's opinion, "the two great issues are":

"First, whether we shall retain, on a sound and permanent basis, our popular Constitutional representative form of government, with the independence of the judiciary as a necessary key to the preservation of those liberties that are the inheritance of 1,000 years, and, second, whether we shall welcome prosperity which is just at our door by maintaining our present economic business basis by the encouragement of business expansion and progress thru legitimate use of capital."

Elsewhere in the address he asserts that the first of these "is the supreme issue," and much that he says about the Roosevelt movement relates to it. But in the following passage he has been misled as to the attitude of Governor Wilson:

"The hostility to the judiciary and the measures to take away its power and its independence constitute the chief definite policy that can be fairly attributed to that class of statesmen and reformers whose absorption and control the Republican party escaped at Chicago and the Democratic party yielded to at Baltimore."

Mr. Roosevelt, according to press reports, says that "in every phase the speech was retrogressive," and that the President "failed to discuss the issues that every man in the country is most concerned in at this time." He is wrong, and we must assume that the address had not been read by him. Mr. Taft, to the extent of 3,000 or 4,000 words, does discuss the projects and propositions of Mr. Roosevelt, with whom, of course, he does not agree as to them. He undertakes to show that the Republican party has furthered equality of opportunity in many ways, citing its recent legislation, much of which has been commended by the ex-President. But he denounces the proposed recall of judges and of court decisions, and he can see no merit in certain other proposed changes which would affect the present form of representative government.

In his review of the record of his Administration he points to the work done in the interest of efficiency and economy, to the negotiation of his peace treaties, and to his other dealings with foreign Powers, speaking at length of his attitude toward Mexico. We are confident that, as he says, "the Administration's course of self-restraint with respect to Mexico will vindicate itself in the pages of history." No one, we think, can study carefully the record of what he has done and what he has refrained from doing, in that case, without admiring his patience, wisdom and sense of justice.

Many will give to the tariff and the Trusts, as issues, more prominence than to the question which he regards as supreme. As he says, it is not true that the revision of 1909 increased the average of duties and the cost of living. But the Republican leaders have failed to impress this fact upon the minds of the

masses. Governor Dix, of New York, asserted long ago that the Republicans in that revision "increased the duties on all the necessaries of life." Many believe that this is true. Republican leaders should have undertaken to enlighten the masses as to the causes of the increase of the cost of living, an increase which, as Mr. Taft says, is worldwide. It is true that he has recently promoted the appointment of a commission to inquire as to these causes, but when will this commission begin its work and how long must the people wait for its report? To the higher cost of living, ascribed by a great number to tariff legislation and to Trust monopoly, is due in part the unrest which creates a demand for unwise changes in methods of government and suggests revolt.

So far as the Government policy with respect to Trusts is concerned, Mr. Taft and Mr. Roosevelt are not at variance, except, perhaps, with respect to an impartial enforcement of the existing law. Both would have the Sherman act supplemented by specific definition of offenses and both would have combinations subjected to Federal supervision and regulation. Mr. Taft is imprest by the importance and beneficial effect of the recent enforced dissolution or disintegration of the Standard Oil and Tobacco Trusts, but the people are not yet convinced that the court's action was really effective. They see that the market value of the Oil Trust shares has advanced about 50 per cent. since the dissolution was ordered, that the price of the Trust's products has been increased by about 20 per cent., and that there has also been an addition to the price of tobacco. They read that a voluntary dissolution of the Beef Trust has been approved by the Government, and they know that the price of beef is rising every day. We do not say that Mr. Taft is not right, but we are speaking of a point of view that affects voting at the polls. There has been, and still is, need of careful explanation to the public, in order that popular support for the wisest policy may be secured.

We are not saying this in hostile criticism of the President's address, but it is suggested by the attitude of many whose opinions deserve to be considered. The address is a comprehensive and frank one, which should be read with care by all who desire to be well informed as to the political issues of the time.

The Success of Woman Suffrage

WHILE our misguided sisters in England are striving to get their way by the old feminine tactics of everlastingly nagging, the women who have the franchise go quietly about their business in the most inoffensive manner. This much may be said with confidence about woman suffrage, that it makes trouble only where it does not exist. Even those who have the lowest opinion of woman's ability would be willing to concede that she can cast a vote straighter than she can cast a stone.

It is curious to see how quickly the woman suffrage question disappears as soon as women get the vote. This is not the case with everything. The tariff question does not disappear when a tariff bill is passed. The liquor question remains a subject of discussion even in prohibition States. The enfranchisement of the negro is not a dead issue a generation after it was accomplished. But when a woman suffrage law is passed, by however slender a majority, society adjusts itself automatically to this supposedly revolutionary change and within a few months it seems to the people as tho it had never been otherwise. The women of California vote like veterans already. In Australia and New Zealand there are some 6,000,000 people living under a recently established régime of equality and nobody thinks anything about it. It is as hard to draw an Australian into an argument over woman suffrage as it would be over the subject of whether or not it is desirable to have schools, steam engines or weather reports.

Differences of race, climate and history seem to make no difference with woman suffrage. It works as smoothly under the North Star as under the Southern Cross. In fact the women in Finland, under the shadow of the autocratic Czar, have taken a more active part in government than in the self-governing British islands of the South Pacific. Ever since the adoption in Finland of universal suffrage in 1906 there have been from fourteen to twenty-five women members of parliament and they have with few

exceptions been re-elected by their constituencies. They represent all classes and occupations, including cooks, dressmakers, teachers, journalists, factory workers, sanitary inspectors and statisticians. They belong to various parties; in the last parliament the twenty-one women members were distributed as follows: Twelve in the Socialist, four in the Swedish, one in the Young Finn and four in the Old Finn parties.

Up to the beginning of last year, according to an article in the last *Contemporary Review,* the women had brought in twenty-nine different legislative bills, of which the following had passed:

(1) The establishment of laws for child protection against ill-treatment.
(2) The complete freeing of the wife from the legal guardianship of her husband.
(3) The raising of the marriage age from fifteen to eighteen years.
(4) The organization of colonies for youthful criminals.
(5) The right of women to assist in the department of public medicine.
(6) The abolition of police observation over prostitutes.

Among the bills introduced by the women members but not yet passed were some that are intended especially to benefit their own sex, such as bills for maternity insurance, for Government midwives, for giving a wife the right to dispose of her children instead of leaving them in the exclusive control of their fathers, for the improvement of schools of domestic economy, for the appointment of women as factory inspectors and for enabling women to serve in public institutions on equal terms with men.

But the women delegates to the Finnish parliament are not concerned solely with the interests of women, for among their measures are: A bill to separate the supreme court from the senate, establishing an independent judiciary, a bill to give Jews equal rights with Christians, a bill extending the suffrage to all adults, a bill to regulate the relations between employers and employees, a bill to increase the punishment for cruelty to animals, a bill granting free meals to school children and a bill for improving the position of illegitimate children and establishing homes for them. The women members unanimously supported a bill prohibiting the importation, sale and consumption of alcohol.

As a whole this is certainly a creditable program, neither visionary nor unduly sentimental. Few of exclusively masculine legislatures could show a better one. The opponents of woman suffrage have open to them only two alternatives; they must either assume that this legislation is intrinsically unwise or that it would have been advanced just as much if the women had not voted. Neither position seems tenable.

In Finland the women voters outnumber the men by 64,436, but they have not taken advantage of it to put an undue proportion of their sex into office. In other places where equal suffrage prevails the number of women in the legislative bodies is much less. It is not probable that the proportion of women in such positions will be very large and we do not think it desirable that it should be. The holding of political offices and the running for them are not among the occupations best fitted and most befitting for women. Most women can find employment in the home more serviceable to the State. There arise from time to time exceptional women better qualified than men for administration and legislation, and they should not be debarred from any offices, even the highest. But it should be made plain in this campaign that the women are asking for votes, not for offices, and that they want votes, not for the purpose of forcing upon the community a body of laws antagonistic to men, but in order that they may cooperate with men in the promotion of measures in the interests of both. Even in a political campaign an attitude of "sweet reasonableness" is the best policy. Equality now reigns in the six Australian States and in six of the American States. The six other States now considering the matter, Michigan, Ohio, Wisconsin, Kansas, Oregon and Nevada, may well follow their example. It is no longer an experiment. It is a demonstrated success.

England and Germany

If the people of two nations think war between them is inevitable, the situation is dangerous, whether there is any real reason for war or not. We are forced to conclude that there is a widespread feeling in both England and Germany that war must come some time. Ger-

many is a country of less size than Texas with more than two-thirds the population of the United States. Her people and trade are expanding, but she has few colonies. If she cannot expand peaceably she would do it by force. She has already the greatest army in the world. She now deliberately proposes to have a navy—if not as great as England's, at least great enough to destroy England's primacy on the seas in case of a conflict. A recent anti-British pamphlet published in Germany, which bears evidence of being officially inspired, says:

"In 1898 the German Navy stood to the British in the relation of 1:6.3, that in 1900 the disparity was only 1:4.8, in 1904, 1:3.5; in 1906, 1:2.9; in 1911, 1:2.5, and in 1912, 1:2.1."

Baron Marschall von Bieberstein, Germany's greatest diplomatist, has just been sent as ambassador to England on the authority of the German semi-official press to bring about a good understanding with Great Britain, "*provided such an understanding could be reached on the basis of equality between the two nations.*" The German Emperor himself has been known to state unequivocally in private audience that Germany's ambition is to be as great on sea as on land, England to the contrary notwithstanding. Some have charged that when the time is ripe her plan is to take Holland, with all Holland's colonial possessions in the Far East. No wonder England, with her population only a little more than half of Germany, and her unproductive or degenerate submerged tenth, is quaking in her boots. Recently the colonies in Canada, Australasia and South Africa are coming to the assistance of the mother country.

And now England has completely and officially thrown away her diplomatic reserve, for Winston Churchill, First Lord of the Admiralty, in asking Parliament for an extra appropriation of $5,000,000 stated the increase was a national misfortune, but an absolute necessity in view of Germany's policy. The majority of Englishmen consider the control of the seas necessary to self-preservation. A navy that could cut off their imports could starve England to death within a few weeks. We suppose, on the other hand, the German Government is determined to expand wherever it can, by peace if possible, otherwise by force. At least Germany's present course leads to such an inference. Probably in a contest of outbuilding battleships Germany would win out unless the colonies are generous in coming to the support of the mother country. Even then it is doubtful if England would win. For England to go to war at once would settle nothing. Germany cannot be conquered even after all her fleet is destroyed. Why should not England propose to Germany that they sign a general arbitration treaty in which each respects the other's integrity and territory—whether motherland or colony — and henceforth arbitrate all questions? This will force Germany to show her hand, for if she refuses to sign such a treaty it will be because she wants some of England's present territory. Then, after Germany had formally refused to accept England's offer, let England publish the whole correspondence for the world to judge. We have authority for stating that the German Emperor prefers anything rather than to be put in the position of refusing arbitration. If international public opinion fails to bring Germany to terms, it will be in order for England to take what further action she may desire.

The Summer-School Girl

"Ba pu li ga mo eu sk jo ve," said the professor, and the class took down the remark in their notebooks.

"Da fe dr ho la hw ri," he continued. "Please complete these by writing out the first words they suggest to you." And so the class dutifully did.

"Now," said the professor of psychology, "we shall see that the results of this experiment bring out a striking difference between the sexes in regard to mental association. Will all in the class who have written 'dance' for the word beginning with 'da' please raise their hands."

Not a hand appeared among the ladies, the only hand raised being unmistakably masculine.

The professor looked perplexed.

"How many ladies have written 'dress' for 'dr'?" None, it seemed. The professor was growing obviously more nervous. "How many ladies have the

word 'lace' on their lists? Has no lady written 'ribbon'?" he concluded, in despairing accents. "Thorndike said you would."

"Perhaps," suggested an elderly lady on the front seat, "he was trying it on the girls in the woman's college."

This is only one instance of what is happening this month in a hundred classrooms where teachers are being taught that the summer-school girl is a different species from the ingenuous and gigglesome creatures that go to college the rest of the year. This lends the excitement of uncertainty to summer-school work and makes psychological experimentation an extra-hazardous occupation. It may be that these "negative results" (to use the euphemism for what outside the laboratory are called "failures"), did indicate that the summer school girl has a mind above dance, dress, lace and ribbons. But then again, the suspicion may arise that she had been reading on ahead of the lesson, a thing no "regular" student is guilty of. She in the seat may know her Thorndike as well as he who stands on the platform. You never can tell about the summer-school girl. It is no use holding a stop watch on her, either, in association tests, for she realizes that the woman who hesitates is lost, and if the professor be afflicted with Freudianism he may ascribe to her a hidden past of unspeakable character when she loses two-tenths of a second in speaking her mind. Psychanalysis is most like to meet its Waterloo when it tackles the summer-school girl.

For, take it any way you please, she is a puzzle. That is because she does what she likes. And on those rare occasions when a woman can do what she likes, why she does what she does is always a puzzle, to the masculine observer at least, perhaps even to herself. Why she should elect astronomy, Greek and woodworking as a correlated course in the university is as mysterious as why she elects pretzels, pickles and charlotte russe for her midday lunch. It is the holiday mood that dictates it; the rapture of release from routine, the possibility of indulgence in caprice. For the fine thing about the summer session is that it retains a freedom and elasticity, a potentiality of personality, that is quite lost in the lockstep of the rest of the year.

When the lady who occupies the chair of mathematics in the West Centropolis High School is voted $375 by the school board "as a reward for twenty years of faithful service and in order that she may improve her efficiency by taking courses of study at some institution of higher education in the East," does she devote herself to the study of Cremona transformations, Abellian functions and the barycentric calculus of Möbius? Not she. She has too much sense. The card she hands in to the registrar bears the strange device, "Ath. 3, Art 4, Rom. 23," for she knows that one who has taught elementary algebra for twenty years straight needs nothing so much to "improve her efficiency" as swimming, sculpture and modern French literature. If the school trustees back home ever find it out, which they are not likely to do, for she will never tell them, let us hope that they have enough sense to see that she is right.

That some of the freakish vacation spirit prevails in the summer school does not imply that it is a period of idleness. Far from it. There is more hard thinking per square foot of the campus done in July than any other month of the twelve. The avidity of the summer student for information of all sorts is something fierce. He or she, and especially she, will take all the classes the law allows, slip into the back seats of one or two others when the teacher is not looking, attend the public lecture at four, and be ready for Shakespeare on the campus or the musical glasses at the roof garden in the evening. The enthusiasm of the summer-school girls is not cooled by the hottest of weather, nor does a dry wind dampen their ardor. They call for books that only the chief librarian can find. They ask questions in class that throw the instructor off the track like a loose rail. If they do not see what they want on the curriculum they ask for it. If it is not forthcoming they are not backward about intimating that there are other establishments in the same line that are more accommodating. They discuss their studies in the corridors and commons, where erstwhile was heard only

talk about athletics and chorus girls. They swarm over the campus once sacred to the masculine. They are no respecters of persons or places. They sit on the grass, on the stairs and on the professors with equal imperturbability. The holdovers, the boys who have received encores on their last year's work, are amazed to see how tolerant the professor is now of interruption, even of correction. The summer-school girls are so serious and earnest, so good-natured and chatty, so alive and lawless, so ambitious and self-determined, in short, so varied and individualized, that they are sure to shatter the traditions of any university which lets them in. They are capable even of humanizing the humanities.

August

Our midyear months are all well named—May, June, July and August—but August is the best of all. It is indeed an august month. Now the wheat fields are either yellow with stubble or golden for the reaper. Red Astrachans ripen in the apple boughs, Summer Rose grows fragrant on its crowded limbs, and Yellow Transparents are hunted out by the knowing ones. They burst open with excess of goodness and sunshine, and the birds feast on the fragments. Winter apples are noble, especially Northern Spies and Winesaps; but they lack the novelty of the August apples—the first to ripen and the most conspicuously red cheeked. Have you observed that early apples cover the ground with invitations to help yourself? No decent winter apples do this; they are conservative and conventional. Nobody wants to pick them up from the sod, for they are still hard, and the harder the better. The Summer Strawberry melts as you break the skin, reminding you of a predigested breakfast food. Nature knows that we be bilious mortals, and serves plentifully her delicious remedies, ripe apples.

Cherries still hang down from the Windsor and Rockport trees, and the Black Tartarians are not yet all gathered into the laughing boys, and the pies. Mem.—A cherry pie is the best in all the world; there is little doubt of it, only let the stones be left in, and so no greedy haste in eating. The editor likes best to sit in his balcony, and pull in to him a loaded limb of Maydukes; or, just as the sun rises, he likes an avenue where the Olivets and the Montmorencys and the Richmonds challenge choice, while still the robin chorus is filling all the world with joyous music.

Of the berries none remains but the blackberries and the gooseberries, and Nature does well to delay their departure. One may have a new sensation who sits down on a violet sod, under the shade of the Judas tree, to sample Red Jackets, Crown Bobs and other gooseberries. Blackberry pies swell their crusts with importance, and their juices run over, full of sugar and flavor. Ah! but such a pie was never known on Olympus. It is the only rival of the cherry.

Who that ever ate a Rostiezer pear did not say, "Yet it was Nature's best thought to make ye pear. It is shaped for ye mouth. One may eat a basketful." Yes, Sir John Wilson! And he may be the worse for it. The pear is not predigested; only the Rostiezer and the Tyson; one may venture with these mouth-fitting sorts and be the better for it. If one cares for fame let him think of the world-wide reputation of the Bartlett and the Seckel. Yet both these were chance born seedlings, and they are full of democracy. The pear orchard is a clean place, but it is not well supplied with shade; one should walk there just at sunset.

Plums are just beginning to ripen, at the very end of the month. This is the fruit that fills up all the gaps and corners, but for all purposes it is the one fruit never to be spared. Who that ever ate a Green Gage plum ever lost desire. It is the acme of nature's brewing. Lovingly red cheeked, honestly golden hearted, it splits open for the sun, until it cannot grow any nearer perfection, and then drops invitingly at your feet. "This be the poor man's fruit, ye grape." Hand over hand up the trees, swinging armsfull of fruit from all the limbs, trained over the porches and on the trellises, and creeping over rockeries—bushels for everybody. The editor pins his faith on plenty of Lindleys and Brightons and Niagaras these hot days. They are better than any cooling drinks. Plant them

everywhere. They will run over an old shed to glorify it and an old fence to illumine it.

August is just the heart of the year, when and where everything is at its best. It is just now that one may have in the same dish the Rose apple, the Tyson pear, the Montmorency cherry, the Lady grape, the Green Gage plum—every one an ideal. The meadows are still green, even where mowed; and the cattle stand in the ponds and creeks, full and happy. How leisurely they swish their tails at the flies! Each swish brings a bucket of cool water over their shining sides. There are more happinesses in this world than are dreamed of in your philosophy, Horatio! It is our felicity to enjoy the world, and all there is in it, in August—almost all. The cicada is in the tree top. The year is at its prime. We have enough if we are wise; and the place to get enough is on a little bit of land, tilled with sweet content and industry and good will. August is no finer for those who roll in wealth than for the modest and temperate owner of five acres.

The Lodge-Monroe Doctrine

We do not profess to know what state secrets were divulged when the galleries of the Senate were cleared and the doors closed at 12.30 p. m. last Friday. But, judging by what knowledge we have on this subject, there is no necessity for "extending," "developing," "reasserting" or "applying" the Monroe Doctrine as Senator Lodge does by his resolution, asserting:

> That when any harbor, or other place in the American continent, is so situated that the occupation thereof for naval or military purposes might threaten the communications or the safety of the United States, the Government of the United States could not see without grave concern the possession of such harbor, or other place, by any corporation or association which has such a relation to another Government, not American, as to give that Government practical power of control for national purposes.

This passed by a vote of 51 to 4, and so must be regarded as an almost unanimous expression of the opinion of the Senate as now constituted, but since it has not been approved by the Administration it is not to be held as an established and permanent part of our national policy, and as such to be communicated officially to foreign Powers. It is not desirable that it should be authoritatively adopted and promulgated, because that would involve a determination to defend it, however large a navy it would require and whatever difficulties it might lead us into.

For, whether it be thought wise or not, it undeniably involves a considerable extension of the Monroe Doctrine as hitherto held and asserted, and must inevitably irritate other nations, even tho they take cognizance of it merely as an expression of the opinion of certain representative Americans. The original Monroe Doctrine was designed to protect the unoccupied territory of North America from colonization and the struggling republics of South America from reconquest by European Powers (meaning the Holy Alliance). As amended by Senator Lodge it would prevent any corporation in which European or Asiatic capitalists were largely interested from buying land about any port which, if it were made a military or naval base, might threaten the safety of the United States or its communications (meaning the Panama Canal). We do not believe that our national safety would necessarily be endangered by such action on the part of foreign traders, while at the same time the strict enforcement of such a rule would certainly interfere in many instances with the legitimate commercial operations of other nations. It is true, to use the specific instance to which the Senatorial resolution is supposed to refer, that if the Japanese Government had possession of Magdalena Bay in Lower California it might be used as a basis of operations against us both by land and sea, but we do not believe that Japan has any intention of invading this country. If, as reported, a Japanese steamship company or a Japanese fishing company is desirous of acquiring a landing at that port we have no reason to interpret that desire as evidence of a belligerent intention. To deny the right of any foreign shipping company to buy the land needed for docks and terminals on any harbor within a radius of 2,500 miles from either end of the Panama Canal is a very sweeping assumption of authority on our part.

The fact is that we are doing a very generous thing in a very ungenerous manner, and as we all know from personal experience the manner of giving counts for more than the value of the gift. We are expending some $400,000,000 for the purpose of giving to the world an international highway to be used by all nations on fair and equal terms. It is very doubtful if we ever get our money back. If we get the interest and running expenses we shall be satisfied. And however much we may charge for tolls and whatever rebates we may allow our own shipping, the Canal is bound to be of greater benefit to other nations, at least for a long time to come, than it will be to us, because we have less shipping.

But we get no gratitude from other nations for this generosity, because we are manifesting a disposition to prevent others from taking full advantage of the facilities which the Canal is designed to provide. To propose, as has been done in the Senate, that foreign ships shall pay tolls and our own not, that vessels owned by foreign railroad companies be prohibited from using the Canal and that foreign companies shall not acquire harbor facilities, gives the United States the reputation of being hoggish at a time when we really are acting with unparalleled liberality.

Hot Weather Railroad Accidents

It has often been noted that serious railroad accidents occur with special frequency at two seasons of the year, during periods of extreme cold and extreme heat. A cold snap benumbs men who have to be exposed to the weather to some extent and apparently makes it impossible for them to be quite as ready in response to signals of danger as during milder weather. Besides, there is the well-known tradition that it is very difficult to run trains on time in zero weather, because metal is more likely to snap and many mechanical fixtures in connection with cars and engines more readily get out of order. It is even more true, however, that a continued extremely hot spell is likely to produce that benumbing of mental activity in which signals may be passed heedlessly or proper precautions for safety fail to be taken. Brakemen are not as active in getting back to guard the rear of their trains, engineers are likely to doze at their posts, which it must not be forgotten are hot, even tho the day be not very warm, and individuals in the signal service are not so reliable in their repetition of orders and the setting of signals.

This has been very well exemplified by accidents such as that to the Federal express at Bridgeport, on the New York, New Haven & Hartford last year, and on the Chicago, Burlington & Quincy and the Lackawanna this present year. These accidents were due to the personal factor which cannot be entirely eliminated from railroad practice and which is inevitably the source of accidents at times of pressure. Unfortunately, two of the holidays that are most frequently observed by the taking of excursions, the Fourth of July and Labor Day, are likely to occur in the midst of hot weather and to add to the burden of responsibility and of hours of labor placed on the shoulders of railroad men.

While this personal factor cannot be eliminated, special precautions can be taken to keep it from manifesting itself at such times when mistakes are known to be liable to occur. While there is often a temptation for transportation departments of railroads to lengthen the hours of labor because of the pressure of passenger crowding, this must never be permitted, but, on the contrary, the companies' officials must recognize the necessity for shortening hours and putting on extra men at such time. It is probable that during very hot weather no man should be asked to ride for more than two hours successively in the cab of an engine. After an interval of rest for an hour or more he might very well be permitted to take another turn of two hours, and then, after another interval, complete his eight-hour day, but a longer strain is almost sure to cause some men to slacken that vigilance and relax the acute, constant attention needed for the running particularly of fast trains, and this readily goes so far as seriously to endanger lives.

Such special regulations would add somewhat to the expense of passenger traffic for the time, but this would be

more than compensated for if lives were saved by it and even a few accidents each year eliminated. The attempt to run trains in just the same way and with just the same amount of help after we have had four or five or more days and nights of intensely hot weather is almost sure to lead to fatalities, because human nature cannot be depended on to react properly to signals and even the sternest call of duty may fail of response under such circumstances. We all know the sense of relaxation that comes over us in such hot weather and the impossibility of doing even the work that we are accustomed to in anything like the usual fashion. Why, then, should railroad men, and especially the engineer in his cab, under particularly unfavorable conditions as regards the heat, be expected to accomplish the same amount of labor in exactly the same way as during better weather?

Unfortunately, while our heated spells are quite as intense as those which occur in tropical climates, we have no proper arrangement for meeting them. In tropical climates it is the custom to lessen work greatly in the middle of the day, or actually give it up entirely, and the sleep that was lost at night so often is made up by a *siesta*. We have no such arrangements, but, as a consequence, our people who are compelled to labor during the midday heat suffer much more frequently from heat strokes than do the inhabitants of tropical climates. In the same way, in countries where they are accustomed to intense heat, they do not ask from men the impossible task of long hours of labor, but shorten the intervals of occupation and put in rests.

This is what must be done in our climate also whenever the conditions of continued heat demand it. Only when we have thoroly waked up to the necessity for this shall we have such freedom from heat strokes in our cities and railroad accidents as will make the columns of our morning papers a little less appalling than they often are during very hot weather. Each summer two or three such periods come and we must simply bow to the inevitable and make arrangements to prevent their being any more serious in their consequences than can possibly be helped. Our railroads particularly must take definite account of the liabilities and relaxation of vigilance at such times and make assurance doubly sure by adding to the number of men employed, shortening their hours, putting in intervals of rest and tiding them over the period of relaxation until milder weather comes.

A Newspaper Conference

The first national newspaper conference of the United States was held last week at Madison, Wis., under the auspices of the Extension Division of the great and progressive State University. The entire journalistic fraternity of Wisconsin united with the university in welcoming the delegates, who came from all over the country. Papers were read from officers of the Associated Press and the United Press and from the responsible editors of great metropolitan journals and small reform weeklies. All shades of opinion were represented and all found expression in the formal papers read and the impromptu debates that followed. The first three days were largely devoted to the question whether the papers serve the public, the unseen interests or themselves. Instance after instance was given to show that the news was colored or suppressed and opinions bought and sold. On the other hand, it was the unanimous opinion of the representatives of the most powerful papers present that giving the public what it wants is the only road to success. The fundamental difference of opinion was, therefore, one in regard to *leadership*. Those whose motto is to give the people what they want cannot be leaders in the highest sense of the word, tho they are likely to build up more powerful organs. It was universally felt, however, that some exhaustive study of newspapers should be made by the schools of journalism, so as to have the evidence at hand of how much space each one devotes to wholesome or unwholesome topics. This has already been started at Columbia. On the last day constructive addresses were given on the endowed paper and the public paper. The address on the former subject by our managing editor, Mr. Holt, is published elsewhere in this issue. The paper on the public newspaper was by the editor of the Los

Angeles *Municipal News*, which has now been running a few months. While this highly significant publication is confining itself almost entirely to news about the city of Los Angeles that has to do with the government, the editor ventured to think that the time might come when the *News* would branch out and print State, national and even foreign news, just like any other paper. Certainly, the discussion of the endowed and public newspaper indicated that from now on more than a few such papers are likely to be started. It was also felt that the time was near at hand for some of the schools of journalism connected with our universities to start model papers. The University of Wisconsin is understood to be considering the matter at this moment. We think no university could perform its true function of teaching, research and public service in any better way. Its stamp of approval would be enough to guarantee the impartiality and high character of any paper it would start, and it could be run very cheaply, as the students could do most of the work, while the various professors would always be available for expert service and advice. But whether the University of Wisconsin takes the lead in this movement or not, it proposes to see that this newspaper conference is continued, and already it is planning to hold another one next year. For this it deserves the thanks of all good journalists and all good citizens.

A Bridge Builder

Prof. Wilhelm Ostwald is coming again to America next October, in part for the purpose of giving an address at the opening of the Rice Institute, at Houston, Tex., partly for the purpose of laying here the foundations of "The Bridge" with which he hopes to span not only the Atlantic Ocean, but also the Alps and all other dividing lines between countries, whether natural or artificial. As was explained in the article on Ostwald in our "Major Prophets" series, May 2 last, he is now devoting his exhaustless energy to the promotion of intellectual internationalism. With this object he has founded in Munich an institution for the world-wide organization of knowledge, *Die Brücke*, or, as he would prefer to have it called, *La Ponto*, its name in Ido, the international language that he favors as a medium of communication. Among other ingenious plans to facilitate the interchange of ideas among all nations is the adoption of uniform and commensurate sizes for the pages of books and periodicals, which would cheapen their production and make it easier to store them on library shelves. He recommends for this world format the "hypothenuse oblong," the advantages of which are explained in *Printing Art* of April and May, 1911, and July, 1912. According to this plan, all page sizes would have dimensions in the proportion of 12 to 17 as nearly as this ratio may be exprest in whole numbers, and they all could be produced from sheets of a single size without loss in cutting, since it is the peculiarity of this system that each page by folding in the middle of its longest dimension makes the next size smaller. The ratio of breadth to length in all the sizes is mathematically exprest as 1 to the square root of 2, or 1 : 1.41. Ostwald, using the international metric system, would start with a page one centimeter in width and 1.41 in length. The next larger size would be 1.41 cm. wide and 2 cm. long, etc. According to this system, the sizes in which all ordinary literature would be printed would be three, having in inches the following dimensions: 4 7-16 by 6 5-16 for pocket editions, 6 5-16 by 8⅞ for standard books and periodicals, and 8⅞ by 12⅝ for works requiring a larger page for maps or plates. The medium size of this proposed international format is almost identical with that of THE INDEPENDENT in width, but is an inch shorter. The hight of a page is immaterial except for esthetic reasons, but the width is important, because upon that depends the rapidity and ease of reading. Experiments made on this question in psychological laboratories have proved that the motion of the eyes in following the lines is least in reading columns of the width here used, so unless very large type is employed a page of this size must be split into columns. To run the lines clear across the page as

Ostwald does involves too much strain upon the eyesight. The International Association of Chemical Societies' meeting in Berlin last April adopted Ostwald's world format of 16 by 22.6 cm. (6 5-16 by 8⅞ inches) for its publications, and recommended it for all the affiliated societies.

Disfranchisement in Georgia

Governor Joseph M. Brown, of Georgia, charges that the election law put upon the statute books of that State by his predecessor, Senator Hoke Smith, and by which the latter rode into power, occupying first the gubernatorial chair and then the senatorial toga, operates to disfranchise 100,000 white men in Georgia, tho it was intended to keep blacks from voting. In his message to the Legislature, therefore, he asks that it be amended, particularly the feature requiring the voter to register six months before an election. Of the 119,000 negroes paying poll tax in Georgia only 19,000 are registered voters, and yet there are over a million blacks in Georgia. Concurrent with this appeal of a Democratic Governor, the white Republicans of North Georgia are preparing to test the legality and constitutionality of the whole law.

Municipal Publicity

Los Angeles, the home of municipal experiments, established some very interesting precedents in connection with the annual meeting of the National Municipal League recently held within its hospitable borders. In the first place it opened the meeting with a municipal parade in which all the assets of the city were graphically marshaled, not alone for the edification of the visitors, but for the illumination of the city's own electorate. In the line of march were hundreds of employees and their equipment, so ordered that the people got a clear idea of the working value of each department and of the city work as a whole. It is a good plan to give the community a chance to see "how the wheels go round," to marshal the municipal assets. To expand the same thought of "visualizing civics" an exhibit was held of such a character that even the *Times* was moved editorially to say, "The greatest benefit which the meeting of the National Municipal League brought to Los Angeles was the opportunity afforded the citizens of our own municipality to get acquainted with our own city." Illustrated lectures and motion pictures were given so that all classes might be reached, from the youngest to the oldest. Perhaps, however, the most distinctive feature was the all-day session devoted to discussing the proposed new charter for Los Angeles. Under the chairmanship of Dr. Haynes, the father of the recall, a distinguished group of municipal experts from all sections of the country discussed the various features in the presence of a large audience. In this way the fundamentals for which the National Municipal League has for eighteen years been working were prest home upon the minds of a sympathetic and progressive people, keenly alert to make efficiency and democracy synonymous terms.

Skipper Ireson of the "Californian"

The British board of inquiry on the "Titanic" case agrees with the American in condemning the captain of the "Californian" for not coming to the rescue of the sinking vessel on sighting her signals of distress. Still, nothing will be done about it. This is one of the cases to which we alluded last week where the law fails to serve the ends of justice. But the women of Marblehead knew what to do:

"'Here's Flud Oirson, fur his horrd horrt,
Torr'd an' futherr'd an' corr'd in a corrt
By the women o' Marble'ead!—

"Small pity for him!—He sailed away
From a leaking ship, in Chaleur Bay,—
Sailed away from a sinking wreck,
With his own townspeople on her deck!"

But there we have the best of evidence that this harsh treatment did not add anything to his punishment. His own conscience was sufficient. Besides, is it not still a matter of dispute today in Marblehead whether old Floyd Ireson was not entirely innocent of the crime of which he was accused? This *post facto* punishment, whether just or unjust, whether inflicted by due process of law or otherwise, is at best a most unsatis-

factory remedy for wrongs, and it behooves us to try to find some better way.

Governor Foss, of Massachusetts, and Mayor Fitzgerald, of Boston, urge the boycott of meat as a means of reducing its high price. A more rational way of effecting a permanent reform is first to ascertain what are the causes of the increased cost of living and then to decide upon what can be done thru municipal action to remedy the evil. The State Food Investigating Commission of New York has issued a report on Market Prices and Costs that shows clearly where part of the trouble lies. The annual food supply of New York City costs $350,000,000 delivered at the transportation terminals. Then it takes $150,000,000 more to get it into the kitchens where it is to be used. The total cost of wholesaling including profits is about 10 per cent. and of retailing about 33 per cent., yet the individual profits of the middlemen are not excessive, and the corner grocer barely makes a living. The committee thinks that the cost of distribution could be reduced to about 20 per cent. by establishing a system of large retail stores in various parts of the city.

For the practice of "murder as a fine art" the United States offers unparalleled opportunities. There are three chances out of four that the murderer will never be brought to trial and ninety-nine chances out of a hundred that he will escape the gallows. In Germany, on the contrary, he would stand ninety-five chances out of a hundred of being caught and convicted. Under these circumstances it is no wonder that we lead the world in this line with a record of about thirty homicides a day. In New York City last year there were 119 cases of homicide, and in London only 19, so to keep up with New York, London would have to kill about ten times as many. Is old England willing to be beaten by us in all the manly sports?

The decision of the Methodist Protestants not to unite with the Northern Methodists has left the field open for union with the United Brethren, and so far as we can see this union is almost assured. The committees of the two bodies have met and found no difficulty and no opposition. On the side of the United Brethren, we understand, the sentiment is unanimous. To be sure, the United Brethren have what they call bishops, but they are no more than superintendents and serve for a term of only four years, not the kind of bishops against which the Methodist Protestants protested when they seceded. The union is one greatly to be desired.

While other Catholic journals of less weight are abusing the godless public schools and the infidel universities, in *The Ecclesiastical Review,* the leader of them all, we find the following:

"To argue that the Catholic students should be induced to leave the secular colleges and universities and to enter Catholic institutions, is to advocate something that is impracticable to the point of being morally impossible. The same reasons that have brought Catholic students to the secular institutions will keep them there, and these reasons are to be found in the splendid equipment, the giving of courses that no Catholic college has the means to offer, the prestige of State university degrees, the free tuition, the proximity to home, and the other material advantages of the secular institutions."

The indignation of responsible leaders of the Anglican Church at the proposed bill for Welsh disestablishment expresses itself without restraint. The Bishop of St. Davids, a Welsh diocese, calls it "the meanest little bill ever brought before Parliament"; and *The Guardian,* the leading Anglican paper, says that "to the morals of the burglar the Government adds the temper of the huckster."

The chemists of the Department of Agriculture have been analyzing the holes in Swiss cheese and find that they consist chiefly of carbon dioxid and nitrogen, with sometimes, when things go wrong, a little hydrogen. This is interesting so far as it goes, but what we want to know is the name of the tune that is played when a thin slice of Swiss cheese is run thru the pianola.

When President Taft said that the Panama Canal would be in operation in 1913 he was thinking only of the time necessary to cut thru the Culebra Hill and construct the Gatun Dam. He did not include in his estimates the time that Congress will take in talking about what the tolls shall be.

Insurance

Expense Factor in Fire Insurance

MANAGERS of fire insurance companies and leading State commissioners of insurance agree that the expense attendant upon the conduct of the fire insurance business is somewhat greater than it should be. Both admit that the task involved in making any substantial reduction in the cost is fraught with difficulties. Customs have been established in the course of the development of the business that are not easy to abandon, and it is probable that the system as practised is, in some respects, faulty.

The principal expense incident to handling the business lies in the compensation that the middleman receives. In this, as in many other commodities which the American people purchase, the seller is compelled to deliver at the doors of his customers. We will not—at least we do not—buy our insurance direct from the companies. We could do it if we would, and, in the matter of fire insurance, save at least 20 per cent. of the present cost. Using the experience of 1911 of the companies reporting to the New York Insurance Department, that would be a saving of $56,000,000 a year. We not only will not attend to this matter ourselves, but we are so ignorant and so careless in that regard we neither know what we need, nor, when we buy and pay, what we have received. We leave the whole duty to be performed by agents and brokers.

What proportion of our best business men know the exact conditions and stipulations that ought to be inserted in their fire insurance policies in order that they will be properly and completely covered against loss by fire? How many read their policies and know what they have obligated themselves to do? The number in either case is disgracefully small. That which we will not do for ourselves we must employ and pay others to do for us.

THE INDEPENDENT has looked up a few facts out of the 1912 report of the Superintendent of Insurance of New York, bearing on the management expenses of the 180 fire insurance companies subject to that office and making sworn reports to it. We find that those companies received in 1911 an aggregate of $280,875,795 in premiums; that they paid for commissions to agents and brokers, salaries to officers and employees, taxes and licenses, etc., a total of $97,220,374, or at the rate of 34.61 per cent. of the premiums. The account stands briefly as under:

Commissions to agents and brokers	$64,842,912	23.10%
Salaries to officers, employees, and other office expenses	24,140,933	8.61%
Taxes, licenses, etc.,	8,236,529	2.90%
Total	$97,220,374	34.61%

Of course, the expense due to taxes and licenses is one beyond the control of the companies, and its burden must be borne by the State. It is unreasonably high, nearly 3 per cent. of the premiums collected. We believe, upon the knowledge we have gathered of the leading companies during a generation of observation of their management, that their home office affairs—salaries to officers and employees, rent, printing, stationery, etc.—are carefully and economically administered, and that while, in particular cases, the cost may be lowered, the efficiency of the service will not permit much of a reduction from the figures quoted above. But there is indubitably room for a vast reform in putting the business on the books by agents and brokers. It is unreasonable that 23 cents out of every dollar paid in premiums should go into the pockets of the middlemen. The insuring public are mainly responsible for this costly folly, but it is the duty of the companies, nevertheless, to institute such reforms as they can to minimize its effects. There are, to begin with, too many agents and brokers living on the business. Not less than three-fourths of them should be eliminated.

Financial

Securities and Trade

THE quantity of business done on the New York Stock Exchange last week was not large (1,815,000 shares), but it exceeded that of the week before by nearly 50 per cent., and the net result was a considerable gain in prices. The advance was quite noticeable on Wednesday and Thursday, but the close on Saturday was below the highest figures. Gains made by representative stocks are shown below:

Shares.		Gain.
84,000	American Can	+ 3¾
69,450	Amalgamated Copper	+ ⅝
9,400	American Smelting	+ ½
9,850	American Tobacco	+10½
34,230	Atchison	+ 1¼
57,135	Canadian Pacific	+ 9
31,900	St. Paul	+ 4¼
57,100	Great Northern	+ 1⅝
46,000	Lehigh Valley	+ 3⅞
15,800	National Biscuit	+ 8
66,016	Northern Pacific	+ 4¼
13,550	Pennsylvania	+ 1
4,826	New York Central	+ 1¼
243,600	Reading	+ 2
261,660	Union Pacific	+ 2¾
468,400	Steel Common	+ 1⅜

It will be seen that trading in the last three stocks was 41 per cent. of the week's business. Prices were affected favorably by the Steel Corporation's report for the year's second quarter, news about the crops (cotton excepted), activity at the steel mills, a further advance of steel prices, apparently trustworthy reports that Governor Wilson desired only a gradual reduction of the tariff, a conviction that tariff changes would not be made at the present session of Congress, and reports of optimistic business sentiment in the West, Northwest and Southwest. The Steel Corporation's net earnings for the quarter were $25,102,265, or 41 per cent. in excess of those of the quarter immediately preceding, these profits adding $56,000 to the surplus (after the payment of dividends and fixt charges), while those of the preceding quarter had shown a deficit of $6,292,000. The recent course of the net earnings may be seen from the following:

Quarters.	1910.	1911.	1912.
First	$37,667,596	$23,519,203	$17,826,973
Second	40,170,960	28,108,520	25,102,265
Third	37,365,157	29,532,725	
Fourth	25,990,978	23,105,115	

Higher prices for steel have been due mainly to a pressure of buyers' demands. Charles M. Schwab said the Bethlehem plants were working to the limit of their capacity and that the company had been forced to decline orders. Reports about general trade were quite favorable. Several special inquiries, addrest to bank officers and others thruout the country, brought optimistic responses. It was noticeable that, as a rule, political events were not affecting business sentiment or conditions. The cotton crop will not be a large one, for the Government's report shows that the condition on July 25 was only 76.5 of normal, against 80.4 one month earlier, and 89.1 a year ago.

....This city's share of the world's output of certain agricultural products, as estimated officially at Washington, is as follows: Wheat, 19.8 per cent.; corn, 74.8; oats, 24; cotton, 59; tobacco, 31; flaxseed, 25.

....This country's output of pig iron in the first half of 1912 was 14,073,274 tons (against 11,982,551 in the six months immediately preceding), a quantity recently exceeded only in the second half of 1909 and the first half of 1910.

....It has practically been decided by the Treasury Department that the size of all of our national currency and national bank notes shall be reduced by about one-third, or from 7.28 by 3.04 inches to 6 by 2½ inches. The change, it is said, will cause a saving of $1,100,000 a year.

....In the last fiscal year, the number of immigrant aliens received in this country was 1,017,155, but 178,083 did not intend to become permanent residents. After allowance is made for these and for other foreign-born persons, who departed to become permanent residents elsewhere, it is estimated that the year's movement to and fro caused a net addition of 401,863 to the population.

The Independent

VOL. LXXII NEW YORK, THURSDAY, AUGUST 15, 1912 No. 3324

Survey of the World

The New Party's Convention

The convention of the new party led by Mr. Roosevelt began in Chicago on the 5th. Ex-Senator Beveridge, of Indiana, was the chairman, and his address was the prominent feature of the first day's proceedings. The new party, he said, stood for broader liberty, fuller justice, social brotherhood against a savage individualism, equal rights and the rule of the people. He would have the tariff taken out of politics by creating a permanent commission, and would modernize the Anti-Trust law. He described at length what he regarded as an ideal tariff, and denounced the "brazen robberies" of the Payne-Aldrich revision. The recent dissolution of certain Trusts had been ineffective. Much of his address was in support of the propositions afterward adopted in the party's platform. The convention was an earnest and enthusiastic one, and women were prominent in it. On the second day the appearance of Mr. Roosevelt on the platform was greeted by cheers, songs, marches, etc., which consumed fifty-eight minutes. His address was a very long one, 21,000 words, and would fill about twenty-eight of our pages. Obviously we can present here only a brief summary of it. The old parties, he said, were husks, boss-ridden and privilege-controlled. This new movement was one of truth, sincerity and wisdom. The real and great questions were to be faced, not evaded. We were now in the midst of a great economic evolution, and we could go forward only by breaking up the old party organizations and obliterating the old cleavage lines of dead issues. Both the old corrupt party machines were under the dominion of the plunder league of professional politicians, who were controlled by the great beneficiaries of privilege and reaction. Neither the Republican nor the Democratic platform contained the slightest promise of approaching the great problems of the day either with understanding or good faith. So the time was ripe for a genuine Progressive movement. The people must rule. There should be provision by national law for Presidential primaries. United States Senators should be elected by popular vote. The short ballot should be used; there should be stringent corrupt practices laws, and publicity for campaign contributions during campaigns. The entire Wall Street press was denouncing the direct primary, in the interest of the bosses and special privilege. He repeated his familiar argument in favor of a recall of court decisions in constitutional cases. He did not question the general honesty of the courts, but prohibitions which had been intended as safeguards for the citizen had become barriers against political and social justice. He spoke at length for measures in the interest of wage workers, the tool users who should be helped to become in part tool owners. Employers should be required to file wage scales with the authorities, minimum wage commissions should be established, and minimum wage standards for the wages of women, with standards for compensation for industrial accidents and diseases. Night labor of women and children should be prohibited, and there should be an eight-hour day in continuous industries. Many other changes were advocated, including old-age insurance. Woman suffrage was favored, and a

strengthening of the pure food law demanded. The Country Life Commission should be revived, and everything possible should be done to make farm life both profitable and attractive. The tendency toward tenant farming should be checked. He repeated his well known views about Trusts. "Our aim," said he, "is to control business, not to strangle it." The Sherman act should be retained, but must not be regarded as sufficient. As a sole remedy it had completely broken down in actual practice. We should utilize those forms of industrial organization that are indispensable to the highest productivity and efficiency. A national industrial commission should be created with power to regulate and control all great industrial concerns engaged in interstate business. His plan for such a commission he described at length. The recent dissolution of the Standard Oil and Tobacco Trusts had been a farce. He believed in a protective tariff, but one primarily in the interest of the wage worker and the consumer. There should be a permanent tariff commission, and revision should be schedule by schedule. He made many recommendations for action to reduce the cost of living, including the elimination of the middleman. Abolition of the protective tariff would not give substantial benefit to the consumer, but would be disastrous to wage workers, business men and farmers. Wrong taxation, exhaustion of the soil, waste and extravagance were among the causes of high prices. The increased output of gold was partly responsible. There should be a searching inquiry by a non-partisan body of experts. There was no greater issue than conservation. Alaska should be developed, and the Government should construct, own and operate railroads there. The navy should steadily be built up, and the Panama Canal must be fortified. Concerning tolls, we must keep our word given in the treaty, which forbade discrimination.——On the third day the convention nominated by acclamation Mr. Roosevelt for President and Governor Hiram W. Johnson, of California, for Vice-President. Mr. Roosevelt's name was presented by William A. Prendergast, of New York. Among

Copyright, by Paul Thompson.

JANE ADDAMS, OF HULL HOUSE

Miss Jane Addams has received from Mr. Roosevelt a telegram from which we quote a few sentences: "I wished to see you in person to thank you for seconding me. I do it now instead. . . . In this great new National Convention of a new party women have thereby been shown to have their places to fill precisely as men have, and on an absolute equality. . . . My earnest hope is to see the Progressive party movement in all its State and local divisions recognize this fact precisely as it has been recognized at the National Convention. Our party stands for social and industrial justice and we have a right to expect that women and men will make within the party for the cause with the same high sincerity of purpose and with like efficiency."

those seconding this nomination were Miss Jane Addams, of Hull House, Chicago; Judge Ben Lindsey and ex-Governor Garvin, of Rhode Island. John M. Parker, of New Orleans; James R. Garfield, Gifford Pinchot, William Flinn and several others spoke for Governor Johnson. In a brief speech of acceptance, Mr. Roosevelt said the honor was the greatest that ever had come to him. Governor Johnson asserted that he would rather go down to defeat with Theodore Roosevelt than go to victory with any other Presidential candidate. The doxology was sung, and then the convention adjourned. Senator Dixon is to be chairman of the national committee, and George W. Perkins will be at the head of the campaign executive committee. It is reported that they expect Mr. Roosevelt will have at least 138 electoral votes.

Its Platform

The new party's platform asserts that both of the old parties have become tools of corrupt interests, and calls for a dissolution of the unholy alliance between corrupt business and corrupt politics. The Progressive party, it says, stands for direct primaries, Presidential preference primaries, direct popular election of Senators and the short ballot, "with responsibility to the people secured by the initiative, referendum and recall." It pledges itself to provide a more easy and expeditious method of amending the Constitution, to work for woman suffrage, campaign fund publicity, strict limitation of campaign expenditures, the registration of lobbyists, publicity of committee hearings in Washington (those on foreign affairs excepted), and the exclusion of Federal officers from State or national political organizations

Copyright, by International News Service

GOVERNOR WILSON AND THE NOTIFICATION COMMITTEE

The expression on the faces of those present at the official notification at Sea Girt, N. J., last week, would indicate Democratic confidence of success. Governor Wilson stands in the center of the group bareheaded and at the right also bareheaded stands Governor Marshall, the Democratic candiate for Vice-President

and from delegates' seats in nominating conventions. It would empower the people to vote upon court decisions relating to the constitutionality of laws passed under the police power of the State; would have injunctions in labor disputes prohibited when they would not apply if no labor dispute existed, and would give the right to trial by jury to a person cited for contempt in a labor dispute, except when the contempt has been committed in the actual presence of the court or so near to it as to interfere with the administration of justice. There is a long list of pledges relating to labor. It includes the advocacy of minimum safety and health standards, prohibition of child labor, minimum wage standards for women, a living wage in all industrial occupations, prohibition of night work for women, abolition of the convict contract labor system, and publicity for wages and hours. The party stands for a revival of the Country Life Commission, a full and immediate inquiry as to the high cost of living, a single and comprehensive national health service, strong national regulation of corporations engaged in interstate business by means of a Federal commission, additions to strengthen the Sherman act, physical valuation of railroad property by the Interstate Commerce Commission, abolition of the Commerce Court, improvement of the national currency system (but not by the Aldrich plan), the leasing of coal and oil lands, and water powers now in the public domain, good roads, government railroads in Alaska, national development and improvement of the Mississippi River, exclusion of railroad-owned ships from the Panama Canal, exemption of American coastwise ships from Panama tolls, a protective tariff, downward revision of the tariff, a permanent tariff commission, repeal of the Canadian Reciprocity Act, a graduated inheritance tax, arbitration for in-

ternational disputes, an international agreement for the limitation of naval armaments, two battleships a year until there shall be such an agreement, a parcels post, a wise and just pension policy, extension of the merit system to include postmasters and collectors, and legislation to defend the people against swindlers who sell worthless stocks and bonds.

Governor Wilson's Campaign

Governor Woodrow Wilson was formally notified of his nomination for the Presidency by the Democratic party on August 7, and delivered a speech to the committee which called upon him at Sea Girt, N. J. After expressing his "profound sense of responsibility," Governor Wilson said, in part:

"We stand in the presence of an awakened nation, impatient of partisan make-believe. The nation has awakened to a sense of neglected ideals and neglected duties; to a consciousness that the rank and file of her people find life very hard to sustain, that her young men find opportunity embarrassed, and that her older men find business difficult to renew and maintain because of circumstances of privilege and private advantage which have interlaced their subtle threads thruout almost every part of the framework of our present law. She has awakened to the knowledge that she has lost certain cherished liberties and wasted priceless resources which she had solemnly undertaken to hold in trust for posterity and for all mankind; and to the conviction that she stands confronted with an occasion for constructive statesmanship such as has not arisen since the great days in which her government was set up."

We comment editorially upon this speech and its subject matter; we add a few lines from the peroration:

"It is not a partisan fight we are entering upon. We are happily excused from personal attacks upon opponents and from all general indictments against the men opposed to us. Our thinking must be constructive from start to finish.

"A Presidential campaign may easily degenerate into a mere personal contest and so lose its real dignity and significance. There is no indispensable man. The Government will not collapse and go to pieces if any one of the gentlemen who are seeking to be intrusted with its guidance should be left at home. But men are instruments. We are as important as the cause we represent, and in order to be important must really represent a cause. What is our cause? The people's cause? That is easy to say, but what does it mean? The common as against any particular interest whatever? Yes, but that, too, needs translation into acts and policies. We represent the desire to set up an unentangled Government, a Government that cannot be used for private purposes, either in the field of business or in the field of politics; a Government that will not tolerate the use of the organization of a great party to serve the personal aims and ambitions of any individual, and that will not permit legislation to be employed to further any private interest. It is a great conception, but I am free to serve it, as you also are.

"To be free is not necessarily to be wise. But wisdom comes with counsel, with the frank and free conference of untrammeled men united in the common interest. Should I be intrusted with the great office of President, I would seek counsel wherever it could be had upon free terms. I know the temper of the great convention which nominated me; I know the temper of the country that lay back of that convention and spoke thru it. I heed with deep thankfulness the message you bring me from it. I feel that I am surrounded by men whose principles and ambitions are those of true servants of the people. I thank God, and take courage."

Congress

The conference report on the pending wool tariff bill was accepted by the Senate, 35 to 28, on the 5th, and the bill was sent to the President. It was a duplicate of the bill which he vetoed last year. The Tariff Board had then made no report on wool and woolen goods. This year's bill he vetoed on the 9th, saying that his first veto had been justified by the board's subsequent report, and that the rates in the present bill were too low. They would be unjust to the wool growers as well as to the manufacturers, and would throw thousands of employees out of work. He would be glad, however, to sign a bill making the considerable reductions which the board's report would permit, and he urged Congress to pass such a bill. He has written a veto message for the iron and steel revision bill, which was sent to him some days ago. It is expected that he will veto the legislative, executive and judicial appropriation bill, because it abolishes the Commerce Court and fixes a seven-year tenure of office for civil service employees in Washington.

The Panama Canal Bill

The Senate, on the 9th, by a vote of 47 to 15, passed the Panama Canal Bill, with radical amendments. Exemption of Ameri-

can coastwise ships from the payment of tolls had been retained, by a vote of 44 to 11, and the exemption had been extended, 37 to 23, to American ships engaged in the foreign trade if the owners agree to place them at the disposal of the Government in time of war. Ships owned even in part by any corporation which violates the Anti-Trust law or the Interstate Commerce law were excluded from the canal, 35 to 28; railroad-owned ships were excluded, and the Interstate Commerce Commission was empowered to ask for a separation of ships from a competing railroad company (without reference to canal traffic) under certain conditions. By another important amendment American owners of foreign-built ships were authorized to procure American registry for them, if they are engaged in the foreign trade. The large majorities may indicate that the Senate would not consent to arbitration. It is said that Mr. Taft will sign the bill. It is sharply criticised by the London press.

Revolution in Nicaragua

At the request of President Diaz, 100 American marines were landed at Corinto, on the 3d. They went at once to Managua, the capital, Diaz having said that his Government was unable to protect American property. The rebels, under General Mena, had captured American boats on Lake Managua, and had sought to wreck the railroad (owned by Americans) from Corinto to the capital. A day or two later, Diaz asked for more marines, and the collier "Justin" was ordered to bring 350 from Panama. On the same ship the Washington Red Cross is sending $1,000 worth of medicines and food. There was a battle at Tipitapa, the result of which is not clearly reported. In another, at Rivas, the rebels were beaten. They wrecked a passenger train on the Corinto road and cut the telegraph wires, but the Government regained control of the line. Costa Rica and Salvador are striving to restore peace. A commission from the Central American Peace Court will arrive at Managua this week, and will try to procure an armistice. Mena is willing to treat for peace, but his conditions are that Diaz shall resign, that General Chamorro shall retire, and that Congress shall elect a President from a list of five men to be named by himself. Owing to crop failures and drought, the people are in a deplorable condition. Many are starving. Business is paralyzed and the treasury is empty. Rejection of the loan treaty at Washington had a depressing effect.——The plague has been stamped out in Havana and no new cases have been reported in Porto Rico for several days. Dr. Guiteras, Cuba's Health Officer, resents the introduction, in the House at Washington, of a resolution for an investigation as to sanitation in Cuba, saying that Cuba's sanitary condition is much better than that of the United States; that the plague came to Havana from Porto Rico, which is territory of the United States, and that the presence of plague in San Francisco has been concealed.

Hayti's President Killed

Gen. Cincinnatus Leconte, President of Hayti since August last, perished in a fire that destroyed the national palace on the 8th. With him were killed at least 100 persons, and twice as many were injured. One of those who lost their lives was his son, Minister of Public Works. Large quantities of powder were stored in a magazine attached to the palace. This powder exploded with tremendous force at 3 o'clock in the morning, and the palace, a wooden structure, was speedily destroyed by fire. There were several other explosions, when the munitions of war stored in cellars under the palace were reached. The President, whose body has been found, was burned to death in his bed. Haytian exiles in Jamaica were jubilant and were saying that Leconte's death had been caused in their interest, but the explosion appears to have been an accidental one. The American Minister says that probably it was due to lack of ventilation in a magazine containing smokeless powder. Congress promptly elected, to succeed Leconte, Gen. Tancrede Auguste, a Senator who was formerly Minister of Public Works. The exiles and their leaders are returning, and he may have to defend his title. The death of Leconte occurred at a time when war with Santo Domingo seemed near at hand. There are 3,000 Haytian

troops on the border. Santo Domingo accuses Hayti of aiding her revolutionists, and the old boundary dispute has not been settled. These revolutionists captured Dajabon last week, and 100 were killed in the battle. Santo Domingo seeks a loan of $1,000,000 for war purposes. Her revenue, collected by American agents, is steadily increasing, but a large part of it is set aside to pay her foreign debt.

The Situation in Mexico

There was little fighting in Mexico last week. Orozco was preparing to leave Juarez, and the Federal troops were 75 miles south of that city. Rafael Hernandez, Madero's Minister of the Interior, was in El Paso on the 7th. He crossed the river and had a conference with Orozco, whose secretary, José Cordova, afterward said that an armistice of fifteen days had been arranged. Orozco denied, however, that any peace propositions had been considered; he still insisted upon the resignation of Madero. An official bulletin issued at the capital said that the negotiations had failed; that Orozco had agreed to surrender if he should be allowed to live abroad without being molested, but had changed his mind, owing, probably, to Senator Fall's speech at Washington and to objections raised by his associates. In the south, representatives of the Government are to meet Zapata this week, with an armistice in view, but Zapata also insists upon the resignation of Madero. In the north, at points east of El Paso, rebel raiders have crossed the boundary and looted American ranches. A commission from Michoacan has reported to the Government that the authorities at Purnandieo, after that town had been sacked by rebels, put to death 210 citizens, pretending that they were rebels. They began with all the prisoners in the jail, and then killed residents of the town, many of the victims being boys. The Government says the "slaughter" was "the most atrocious in the history of the republic." The Government's awards to claimants for damages excite much comment. They were announced last week by the Mexican consul at El Paso. For each American killed on American soil in El Paso and Douglas during the battles of Juarez and Agua Prieta the award is only $2,000, but $10,000 is given for every Chinaman killed at Torreon and $20,000 for every German.

Peru's Rubber District

Peru's minister at Washington says that responsibility for the offenses in the Putumayo rubber district should be shared by the British rubber company, whose enormous profits did not benefit Peru. The witnesses who gave Sir Roger Casement information, he adds, were guilty, but were allowed to escape. They were Barbadian negroes and British subjects. The British Government, it has been announced by Premier Asquith, will have an investigation made by a select parliamentary commission, with especial reference to the British company. Peru's special commissioner appointed for the district has formed a police force. Before Sir Roger's report was published, the Pope had received a report from Padre Genocchi, who had been sent to make an investigation. On account of this report he made urgent representations to the Governments concerned, the British Government included, and in an encyclical letter he has instructed the archbishops and bishops in South America to prevent, if possible, the brutal enslavement of natives. Missionaries are directed to establish new stations. Four English Franciscans were appointed last week to go to Putumayo. The Protestant missionary societies in London decided to establish Protestant missions there at points where they would not conflict with others. The district is claimed by Colombia and Ecuador, as well as by Peru. Colombia's consul general at New York says in a letter to a newspaper that "the outrages have been encouraged by the Peruvian authorities," who have "supported the predatory operations" of the rubber company "in order to obtain forceful possession of territory which does not belong, and never has belonged, to Peru." All of it, he says, belongs to Colombia, and Peru's "greed" has caused invasion and has not been restrained by considerations of human life. Peru's consul general has directed the attention of his Government to these remarks.

The Suffrage and Terrorism

The most severe sentences yet pronounced in the cases of any militant suffragists were given on August 7 to Miss Gladys Evans and Mrs. Mary Leigh at Dublin. Each is sentenced to five years' penal servitude, the former having been found guilty of arson (she set fire to the Theater Royal, Dublin, when Mr. Asquith was about to speak there in July), and the latter guilty of having thrown a hatchet at Mr. Asquith and John Redmond, the Nationalist leader, wounding the latter. An accomplice is sentenced to serve seven months. The secretary of the Woman's Social and Political Union, at London, says: "It is too monstrous to be credible. I cannot say what effect the sentences will have on militancy." The Attorney General for Ireland in opening the case against Miss Evans said: "We could not feel safe in our homes or places of entertainment if we allowed sympathy to interfere with the course of justice." Judge Madden, in pronouncing sentence, emphasized the horror of fires in theaters, and said he could not consider the motive of the prisoners, but only the safety of society. Miss Inez Milholland, a suffrage leader of New York, holds the British Government responsible for the attempted crimes, a Mr. Hobhouse, a member of the Government, being quoted as having said last February that there was no demand by women for the vote. When men wanted the ballot, Mr. Hobhouse is said to have declared, they burned Nottingham Castle. The resignation of Mr. Hobhouse has been demanded in the House of Commons. A suffraget entered the Glasgow Art Gallery on August 9 and used a hatchet on one of the paintings hung there.

Turks and Italians

The Italian forces occupied on August 6 the town of Zuara, Tripoli, and the surrounding oases. The Turks and Arabs retired after a stubborn resistance to the desert. Zuara was practically their last foothold of any importance on the Tripolitan coast.——Fighting between small bands of guerrillas and the Turkish troops is reported from the Montenegrin frontier. The Turkish Minister at Cettinje has resigned.——Massacres by the Turks are reported, as well as Montenegrin successes. Russia is said to be backing Montenegro.——An earthquake shook Constantinople on the night of August 8. The excited population rushed into the streets, breaking the military regulations. Several hundred persons were killed and thousands are homeless as a result of the shocks, which shook not the capital alone, but the towns and villages along the Marmora.——The political situation is complicated, and the Committee of Union and Progress may, it is said, attempt to restore Abdul Hamid in order to regain control.

Foreign Notes

The French armored cruiser "Condé," with M. Poincaré, the Prime Minister, on board, reached Cronstadt on August 9, and was boarded by the Russian Minister of Marine and the full admiralty staff, as also by the French Ambassador to Russia and his staff. M. Poincaré spent Sunday and Monday at the Peterhof Palace as the Czar's guest. ——The abdication of Mulai Hafid, Sultan of Morocco, is virtually an accomplished fact, and he is expected to leave Rabat for France.——An explosion in a coal mine in the village of Gerthe, near Bochum, Germany, on August 8, resulted in the death of 105 miners. The Emperor proceeded to the scene and contributed to the relief of the families of the victims.——The Spanish Government is facilitating the embarkation of Portuguese Royalist refugees for Brazil. The Spanish Government is itself perturbed over Republican activity in Barcelona and Valencia. A general strike has been threatened.——The volcano of Stromboli, north of Sicily, has become active, the eruption being accompanied by tremendous explosions. This is the first activity since 1907.——A force of Persian military police, under the command of two Swedish officers, was repulsed on August 7 while endeavoring to dislodge the ex-Shah, Mohammed Ali Mirza, from his strong position in the mountains south of Shiraz. The Government forces lost twenty-one killed and wounded, including one of the commanding officers, besides a mountain gun and a considerable number of rifles.

Hiram W. Johnson, Governor of California

There was some talk, before the convention, about naming a Southern Democrat in the second place on the Progressive party's ticket, but Governor Johnson, of California, was nominated by acclamation. By some he has been called "the Roosevelt of the Pacific coast." He was born in Sacramento on September 2, 1866, the son of Grove L. Johnson, who had been a member of Congress and was one of the ablest lawyers in the State. Hiram, while a student at the University of California, was pitcher of the baseball team and editor of the college paper. In his junior year he eloped, was married and began to study law. At the age of twenty-one he was admitted to the bar. While practising in Sacramento he opposed the local political machine. Later, in San Francisco, he took up the prosecution of Reuf and other grafters after Francis J. Heney had been shot. By a reform league he was induced to become a candidate for Governor. After a memorable canvass he won at the primaries and was elected. As Governor he procured the adoption of twenty-three Constitutional amendments by the Legislature, and nearly all of these were approved by the people at the polls. His picture is shown above, but we add the description published in *La Follette's:* "Square-shouldered, short-necked, deep-chested and slightly rotund, very much like a boxer ready for the bout."

Panama Traffic and Tolls

BY EMORY R. JOHNSON

Special Commissioner on Panama Traffic and Tolls.

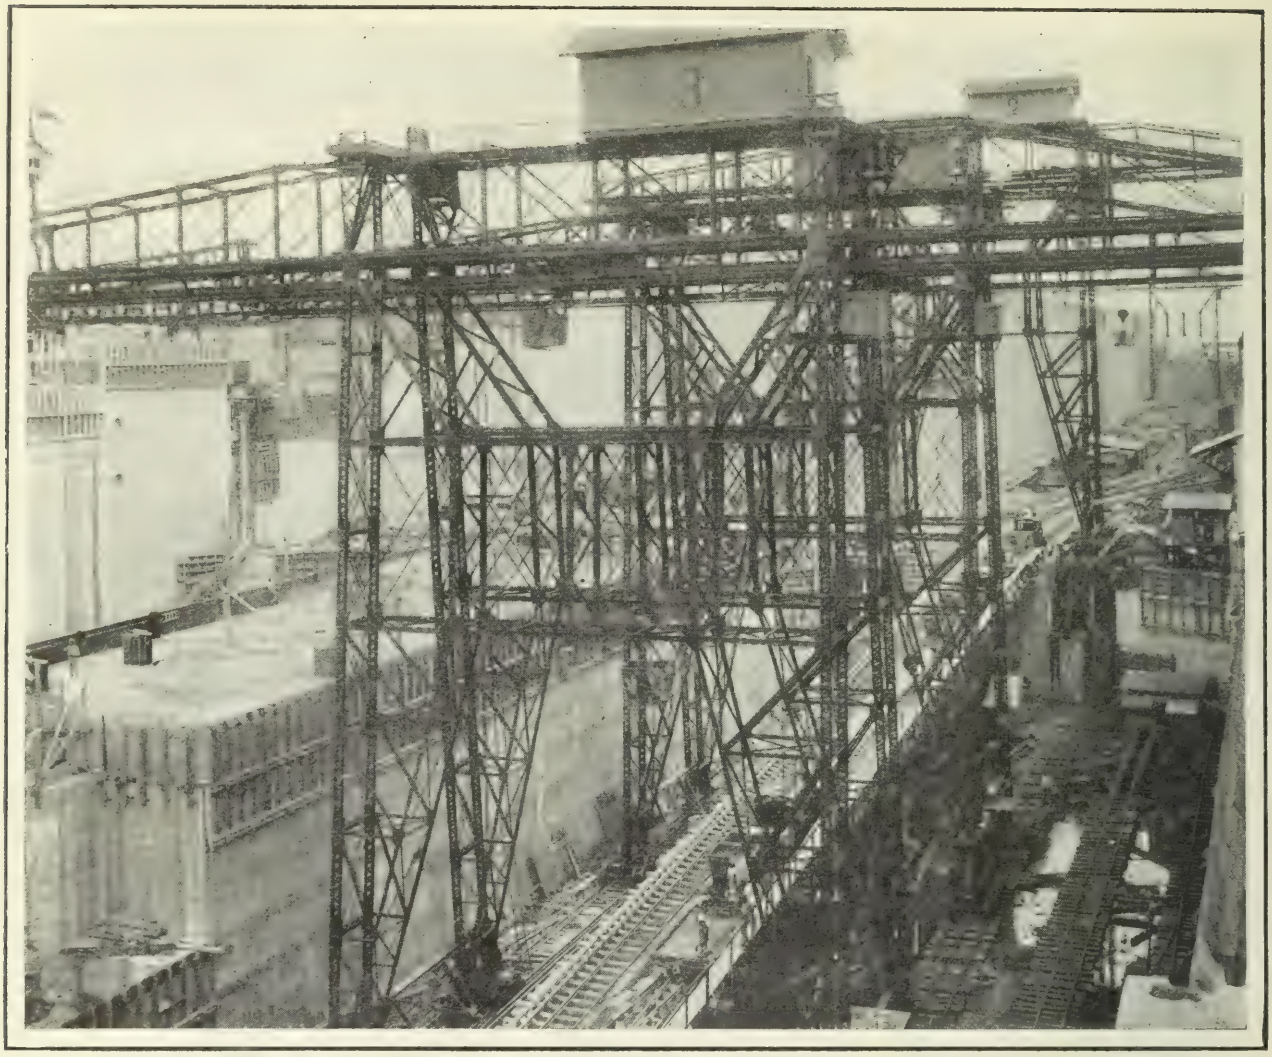
THE Panama Canal is five-sixths finished. The waters of the Chagres are now being impounded, and the formation of Gatun Lake has commenced. By the end of the rainy season, next December, the surface of the lake will be 50 feet above sea level, and before the end of the following rainy season, it will have risen to its full hight of 85 feet above the ocean. Excavation will continue in Culebra cut during most of the year 1913, and construction work will be carried on at the locks and elsewhere; but, not later than January, 1914, the canal will be ready for the passage of merchant shipping. Indeed, the experimental operation of the canal—the passage of the commission's floating equipment thru the locks—will start in the closing months of 1913. During 1914 the operating force will be trained, the complicated machinery of the locks and other works will be tested and tuned up; and then, on the 1st of January, 1915, the canal will be formally opened. On that day a fleet of men-of-war, representing the navies of the world, will pass in imposing procession from Cristobal to Balboa, followed by another equally large fleet, composed of assembled passenger and freight vessels flying the flags of all maritime nations. Thus will stately ceremony mark the final achievement of the hope of centuries.

The Panama Canal has been constructed to increase the efficiency of the American Navy and to serve the commerce of the United States and foreign countries. Will the use made of the canal justify the expenditure of $375,000,000? Has its construction been worth while?

The naval advantages derived from the Panama Canal will be of such value that many men regard the waterway primarily as a military asset, as a work that must have been and would have been executed regardless of its commercial usefulness. This is an exaggerated view of the military as compared with the commercial value of the canal, the chief purpose of which, as I conceive it, is to shorten the routes of ocean commerce. However, our naval power will be very definitely strengthened. The mobility of our fleets will be so increased, and thus their ability to defend our now widely separated seaboards will be so much greater, that military experts are wont to say that the canal will double the efficiency of the navy. This may be an overstatement of the facts, but is probably approximately correct.

As Admiral Mahan has pointed out, our strong fortifications at the Atlantic and Pacific termini of the canal will enhance its value to our navy. The Canal Zone thus becomes a strong naval base from which our fleets may go forth to strike a blow, and to which they may return, confident of being protected while coal and other supplies are being secured and while the vessels of the fleet are being given necessary repairs. Of course, one does not need to be a military expert to appreciate the importance to the United States of having both strong fortifications and a secure, well-equipped naval base at the sole gateway between the Atlantic and the Pacific.

The military and naval importance of the Panama Canal to the United States and the inevitable fortification of the waterway were clearly recognized by Great Britain in 1901, when the Hay-Pauncefote Treaty was negotiated. The treaty is silent upon the question of fortifications and merely states that the United States "shall be at liberty to maintain such military police along the canal as may be necessary to protect it against lawlessness and disorder." The officials representing the British Government in the negotiations clearly recognized the military rights of the United States at Panama, and the understanding of Great Britain was stated in an unpublished memorandum signed by Lord Lansdowne at the time the treaty was being negotiated. This explains why Great Britain did not mention the Hay-



Pauncefote Treaty last year when the United States began the erection of the forts at the Isthmus.

The Panama Canal will be used by a large volume of commerce. There will be at least 10,500,000 net tons of shipping passing thru the canal, annually, during the early years of its operation. By the end of the first decade—by 1925—the traffic will doubtless have increased 60 per cent. and will have reached 17,000,000 net register tons. The Suez Canal's net tonnage is now 17,000,000, and it has risen about 70 per cent. during the last ten years. The foreign commerce of the twenty-two leading nations of the world grew about 60 per cent. in value during the ten years preceding 1911; while the trade of the United States with non-European countries rose nearly 73 per cent. The traffic between the Atlantic-Gulf seaboard of the United States and Pacific countries, which is the commerce that will derive largest benefit from the Panama Canal, increased 78 per cent. during the decade preceding 1911.

The prediction here made as to the traffic of the Panama Canal in 1915 and in 1925 assumes merely the continuance of the 60 per cent. rate of increase that has prevailed in the available canal tonnage during the past ten years; and, thus, takes no account of the stimulating effect which the new route will have upon the commerce it serves. The estimate is probably more conservative than future events will prove to have been warranted. It has been thought best to err by understatement rather than exaggeration of the facts; but it is certain that the commerce of Europe and of the Atlantic-Gulf seaboard of the United States with western South America and with the west coast of the United States will be given a great impetus by the canal. A relatively large expansion of the trade of the eastern part of the United States with Australasia and with the Far East may be expected. For the commerce of Europe with Australia and with the Pacific coast of Asia, the Panama Canal must invade a traffic field which distance makes tributary either to the Suez Canal or to the route around the Cape of Good Hope; and it is not probable that much of Europe's trade with the countries on the west side of the Pacific will choose the American route.

The lower cost of coal via Panama than by way of Suez will also favor the use of the Panama Canal by the commerce of the Atlantic seaboard of the United States with Asia east of Singapore. A freight steamer of about 3,000 tons net register and with a cargo capacity of about 8,500 tons paid $20,868.75 for coal on a voyage, made in 1911, via the Suez Canal from New York to Manila and return. By way of a Panama Canal the fuel cost would have been $18,222.50, or $2,646.25 less by the American route. It is expected that coal will be sold by the United States at Cristobal and Balboa for reasonable prices to the merchant shipping of all flags. This policy will be wise for both commercial and naval reasons. The ability of the Panama Canal to compete with the Suez and other routes may be increased by keeping the cost of coal low at the American isthmus. Indeed, fully as much can be accomplished in the development of traffic by keeping the coal costs at a minimum, as by making the tolls low. The Government will, in any event, need to provide coal and coaling facilities for the navy at the Isthmus. By enlarging its stock of coal and by increasing its facilities so as to supply merchant vessels, the United States may both increase the traffic and revenues of the canal and lessen the expense of supplying coal to its warships.

The time has come to prepare for running the canal. The necessity is urgent for prompt and wise legislation authorizing the President to organize an operating force, and to fix the tolls. There are now on the Isthmus about 5,000 skilled American employees, from among whom should be selected the 2,500 men that will be required to operate the locks, to run the power plant, and to man the maintenance equipment, the shops and other auxiliary works. Before the end of this year many of these trained men will be seeking employment in the United States unless they are assured of permanent positions on the Isthmus. Congress realizes the need of action and it is expected that appropriate canal legislation will be enacted before adjournment.

THE PANAMA CANAL TODAY

This illustration is reproduced from the latest photograph of the Miraflores lock, in construction. The chamber cranes shown were formerly used at the Pedro Miguel locks.

The general policy that may wisely be followed in levying tolls for the use of the Panama Canal was concisely stated by President Taft in the message he sent to Congress December 21. He said that:

"So far as we can, consistent with the development of the world's trade thru the canal, and the benefit which it was intended to secure to the East and West coastwise trade, we ought to labor to secure from the canal tolls a sufficient amount ultimately to meet the debt which we have assumed and to pay the interest."

The annual expenses incurred in operating and maintaining the canal will be $3,500,000; for the sanitation and government of the zone, another $500,000 will be required; and 3 per cent. interest on $375,000,000 will amount to $11,250,000. Beginning with 1914, an annuity of $250,000 must be paid Panama, in accordance with the terms of the treaty of concession. Thus, to be commercially self-supporting, the canal will need to have a yearly revenue of $11,500,000. An annual revenue of $19,250,000 would enable the United States to operate and maintain the canal, govern the Canal Zone, pay the Panama annuity, pay interest on the canal investment and set aside an amortization fund of 1 per cent. per annum. That, to quote the President, would be "a sufficient amount ultimately to meet the debt which we have assumed and to pay the interest."

In fixing the rate or rates of tolls to be levied at Panama, the fundamental question to be decided is whether a system of charges can be devised that will, within a reasonable time, yield an annual revenue of about $19,250,000, and will do so without seriously limiting the ability of the canal to compete for traffic

against the routes by way of the Straits of Magellan, the Cape of Good Hope, and the Suez Canal. The use of the canal by commerce must, of course, be given first consideration; the traffic of the canal and the benefits it may confer upon American industries must not be unduly restricted for the purpose of securing revenue from tolls.

Fortunately, the evidence, both as to the volume of traffic and as to the ability of the Panama Canal to compete with alternative routes, indicates clearly that an annual revenue, starting with $10,000,000 and rising within two decades to $20,000,000, can be secured from tolls that will neither burden nor unwisely restrict commerce. The tolls that will produce this result will not be high. They need not exceed 5 or 6 per cent. of the average freight charge paid by shippers upon the traffic using the canal. Carriers and merchants are agreed that a Panama toll equivalent to 60 cents per ton of cargo in the ship, cargo upon which the freight rates will average $10 a ton, will be a moderate charge.

From the standpoint of national policy, it is highly important that sound business principles should be adhered to in the management of the Panama Canal. The $375,000,000 invested in the waterway has been, or will be, secured in large part by borrowing funds. The interest and principal of this debt can be paid only by increasing general taxes or by levying adequate canal tolls. The funds required for inland navigation, irrigation, reclamation and other public works, for the promotion of the public health, for keeping our army and navy abreast of requirements, will unavoidably place an increasing burden upon Federal revenues. In my judgment, the present and prospective receipts of the Federal Government do not justify the construction of the Panama Canal at the expense of the general budget, and its maintenance on a non-revenue basis. Business prudence requires that the canal shall be commercially self-supporting.

It is often asserted that the Panama Canal will be such a valuable military and naval asset that the United States may properly write off the capital cost as a military charge, and keep the tolls low enough to yield only operating and maintenance expenses. It should be remembered, however, that the maintenance of the fortifications at the Isthmus, manned by 6,000 men, the upkeep of the naval station, and the support of some 1,200 marines in a permanent camp within the Canal Zone will require an annual outlay little, if any, less than the sum required to run the canal and pay the interest on the investment.

The government of the zone, the operation of the canal, and the fixing of the tolls are administrative tasks to be entrusted to the President. The determination of what the rate and basis of tolls shall be is peculiarly an executive problem; for the charges must be fixed with reference to the volume of traffic, and they must be so levied as to yield the desired revenue with the minimum interference with commerce. For these reasons the bills now pending in Congress wisely authorize the President to fix the tolls within limits established by law, to formulate the rules for determining the tonnage of ships, and to make such changes, from time to time, in the rate and basis of charges as may be justified by the increase in traffic and in the amount of revenue obtained.

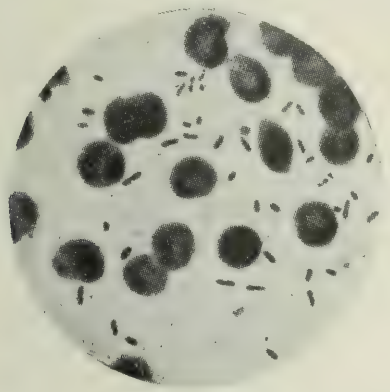
WASHINGTON, D. C.

The Black Plague

BY LEONARD KEENE HIRSHBERG, A.B., M.A., M.D.

EVERY Atlantic and Gulf port is today enforcing strict precautions against the spread of bubonic plague into this country. Surgeon-General Rupert Blue, of the Public Health and Marine Hospital Service, recently telegraphed orders to the officers at Portland (Me.), Boston, Providence, New York, Perth Amboy, Baltimore, Norfolk, Wilmington, Charleston, Savannah, New Orleans, Pensacola and Galveston. They were directed in view of the plague outbreak at California, Havana and Porto Rico, to confer with the city health officers and urge the collection, examination and destruction of rats, mice, squirrels and fleas, especially on the water front. Flea-infected squirrels and rats are the most common means of spreading the plague. Passed Assistant Surgeon R. H. Von Ezdorf was ordered from Mobile to assist in the outgoing quarantine at Havana.

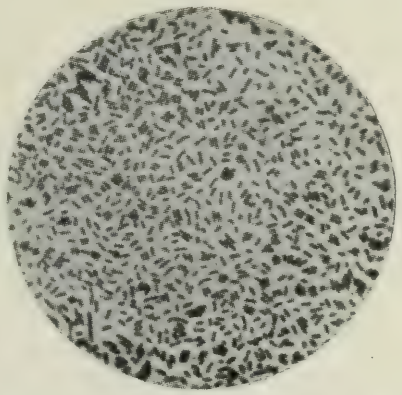
Dr. Guiteras, the Marine Hospital representative at Havana, telegraphed today that there was a heavy mortality of rats on Mercadores street, close to the source of the plague case.



Orders were sent to Havana to commence thoro fumigation of all vessels bound for the United States. Immediately after the discharge of cargoes all rats will be destroyed and the vessels prohibited from going to or lying at the docks or wharves there. The freight will be inspected and certified on bills of health. No crews are to be shipped in Havana and no shore liberty will be allowed crews there. All passengers at Havana will have to be certified individually prior to their departure for this country, showing that they have not resided in the infected districts for seven days. Otherwise they will be detained seven days in Trisconia, the old detention camp near Havana. Key West and New Orleans will carefully inspect passengers and crew as to their temperature and fumigate vessels against rats until the officials are notified that the precautionary measures are being carried out in Havana. At Key West vessels from Havana must lie in stream or take measures to prevent rats from getting ashore. The New Orleans authorities will inspect the unloading and refumigate if necessary.

In submitting to Congress a special report on bubonic plague conditions on the Pacific Coast, the Secretary of the Treasury has appealed for an additional appropriation of $500,000 to be used in a crusade against the disease. The Public Health and Marine Hospital Service is expending its funds at the rate of $14,000 a month. Provided there are no new outbreaks, it is estimated that it will take four or five years to complete the task of eradicating the disease. No new cases have been found in Californian cities for some time, but the disease has been prevalent among the underground squirrels in the country and human cases have occurred in the rural districts each year. The eradication of the disease from these country districts is the problem at present confronting the Service. Money will also be needed to prevent yellow fever, which now exists in several South American ports, from making its appearance in the Southern States.

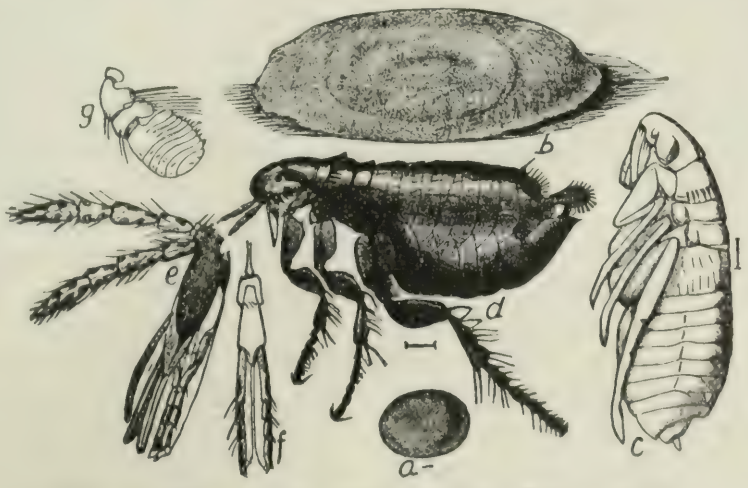
The bubonic plague is an infectious disease caused by a minute organism called *Bacillus pestis*. This disease has killed at least two billion beings in the past two thousand years, but not until the nineteenth century was the organism discovered. Two noted pathologists, Kitasato and Yersin, made the discovery simultaneously and independently. The antitoxin and the vaccine have both been used largely and with good results, but the bubonic still remains a dreadful plague. It is a yearly epidemic in the



Far East. Authorities agree that it is the most deadly malady known, the mortality being usually around 50 per cent. In some rare cases it is almost 100 per cent.

The bubonic plague derives its name from huge boils or buboes which appear upon the neck and groin and under the arms of the patient. The period of inoculation is from three to seven days, after which for a day or two chills, fever, headaches and nausea occur. After this the buboes appear, and the patient becomes very ill. If he can walk at all he staggers. His temperature rises to

BACILLUS OF THE BUBONIC PLAGUE
Cover glass preparation, agar culture, forty-eight hours' growth at 37° C.



104 degrees or more, and his pulse beats rapidly. He can scarcely speak, as his tongue becomes dry and yellow. After an elapse of two or three days his temperature falls slightly, but only for a short time. It rises again, as at first, and remains in this condition for a week or so. During this time death often puts an end to his sufferings. If he escapes his temperature gradually falls. But even under the most favorable conditions the results are severe, often leaving the heart weak, causing the patient to die suddenly; or the lungs are affected and pneumonia sets in; or again, the boils or buboes change into running sores. So it will be seen that this disease is most

BACILLUS OF THE BUBONIC PLAGUE
Cover glass preparation, from liver of rat

painful and dangerous, making the mortality high and the regaining of health slow and uncertain.

Investigations have proved that the bubonic plague is transmitted to human beings by rats; when it breaks out among them they die by the hundred thousands. A rat-flea, a species of Pulex, carries the germ upon its feet or in its jaws and plants them upon man. Bubonic plague may enter the body thru dust taken into the lungs or thru food which has been infected by fleas. Drugs are absolutely useless in the treatment of bubonic plague. When once a case develops, in fact, little can be done to halt or modify its course. But preventive measures are often remarkably effective. They may be divided into two classes: those which contemplate the isolation of patients and the destruction of rats and insects, and those which involve the employment of the serum and vaccine.

ONE OF THE FLEAS THAT CARRY THE PLAGUE
Pulex serraticeps: a, egg; *b*, larva in cocoon; *c*, pupa; *d*, adult; *e*, mouth-parts of same from side; *f*, labium of same from below; *g*, antenna of same

A rigid quarantine is necessary to keep patients from infecting other persons. All rats and other small animals must be killed, and efforts must be made to de-

stroy all roaches, fleas, flies and bedbugs. The bodies of the dead must be burned, all sickrooms must be disinfected with formaldehyde, and chloride of lime must be lavishly used in all drains. The burial of any man dead of the plague is a crime against the human race. The body is alive with the organisms, and these will remain alive for an almost incredible period. Months afterward they may reach the surface of the ground and begin extensive journeyings, in the bodies of rats or upon the legs of insects. The result will be inevitably a fresh outbreak of the malady. Indeed, bubonic is such a virulent disease that in the past the military power has often had to come to the aid of those fighting it. Very often martial laws alone can insure the proper destruction of corpses and the proper isolation of patients.

Yersin's antibubonic serum is made by inoculating healthy horses with virulent plague bacilli. The blood of the horse begins at once to combat these bacilli, by producing substances which paralyze them and neutralize their toxins or poisons. By and by this blood is so full of these substances that plague bacilli cannot live in it. Then some of it is drawn from the horses' veins and injected into the veins of human patients. It retains its power of combating bacilli and so confers immunity to the plague. Unluckily, this immunity is not permanent. Experiment tends to prove, in fact, that it lasts no longer than two weeks. Therefore a man exposed to bubonic infection should be immunized anew every fortnight.

Haffkine's prophylactic plague fluid consists of a dead culture of dead bacilli. These bacilli, of course, are inert themselves, but their toxins, or poisons, are unaffected by the means employed to kill them. When a dose of the fluid is injected into a man's veins, these toxins stimulate his blood to produce antitoxins, and the blood, after having produced antitoxins enough to overcome the toxins, keeps on. The resulting surplus of antitoxins serves to make harmless any bacilli that may wander in subsequently, and thus the man is rendered immune to the bubonic.

There is a difference of opinion as to how long this immunity lasts. In many cases it undoubtedly lasts a good while, perhaps several months. In consequence, Haffkine's fluid is extensively used in the tropics to immunize white men who are exposed to plague infection. Lord Curzon, when he was Viceroy of India, submitted to inoculation, and thus set an example which bore good fruit. It is probable that if all the inhabitants of India, for instance, were thus immunized, the bubonic would soon die out. But the ignorant natives, like ignorant people everywhere else, are opposed to inoculation, and it is difficult to make them submit to it. In addition, the fluid is rather expensive, and it would take 100,000 doctors to inoculate all the people of India within a reasonable time. Besides that, there are very serious practical difficulties. For one thing, during a few days following inoculation, the Haffkine fluid makes the person inoculated more instead of less susceptible to infections. For another thing, if it is employed after a person has become infected, but before the symptoms of the disease have developed, it is apt to produce a serious, perhaps fatal attack. Only with proper precautions is its use advisable.

Despite the popular idea, bubonic plague is not a malady peculiar to the tropics. During the Middle Ages it frequently ravaged Europe, and in recent years it has appeared in New York City, Bremen, Hamburg, Glasgow, San Francisco and other seaports of the temperate zone. It is most common in tropical countries because the people live with least regard for hygienic safety.

Rufus Ephesus, a physician who lived long before the beginning of the Christian era, was the first skilled observer to describe the bubonic plague. A fragment of his work on the subject, still preserved, says that the malady in his time was epidemic in Libya, Egypt and Syria. It raged in Africa for centuries, but so far as is known it did not reach Europe until the sixth century of our era. When it once got a foothold it spread rapidly and soon it began to have victims in all the cities of the continent. In the year 543 it killed 10,000 persons in Constantinople, and in 590 it raged in Rome. In the fourteenth century, under the name of the Black Plague, it devastated the whole of Europe. There is some doubt as to whether all of the epi-

demics ascribed to the mysterious Black Death were really due to bubonic, but it is plain that most of them were. In 1664 came the great plague of London, when 70,000 persons out of a population of less than half a million died. According to some authorities, the disease was introduced by way of Holland.

In modern times there have been many great epidemics. In 1803 Constantinople lost 150,000 of her people, and ten years later there was another outbreak, with a mortality of 110,000. The next year the bubonic appeared in the Balkans, and the ensuing epidemic continued for no less than twenty-five years. Meanwhile the infection spread to Greece and Italy. In 1877 a few cases were observed in Astrakhan, Russia. Within a few weeks there were thousands of cases and whole provinces were well nigh depopulated. This epidemic is thought to have been caused by fleas and other insects introduced from Persia. The number of deaths is not known, but it is thought that it reached 2,000,000. In China the bubonic has been prevalent for at least one thousand years. In the fourteenth century there was a terrible epidemic and millions died. It spread to all the islands of the China seas, and when the Japanese annexed Formosa they found many cases there.

BALTIMORE, MD.

Men We Are Watching

BY A WASHINGTON JOURNALIST

Carmi A. Thompson

SECRETARY TO THE PRESIDENT.

CARMI A. THOMPSON, who has just been appointed secretary to the President, is the fourth to occupy this position under President Taft. This is most unusual, but conditions have arisen rendering the changes advisable, and the President has shown a growing appreciation of the qualities requisite to the important office in the succeeding appointments. The position of secretary to the President is very different from what it used to be, and very different from an ordinary secretaryship. It is no longer a station at the President's elbow, with pad and pencil for dictation, and readiness for errand-boy service. It is a position of responsibility and brain-work hardly second in demands to that of the President himself. Lamar, Cortelyou, Loeb lifted the position higher and higher till it is a fact, today, that the ability of the secretary, and his direct and indirect influence, makes a vast difference in the success of the President's administration.

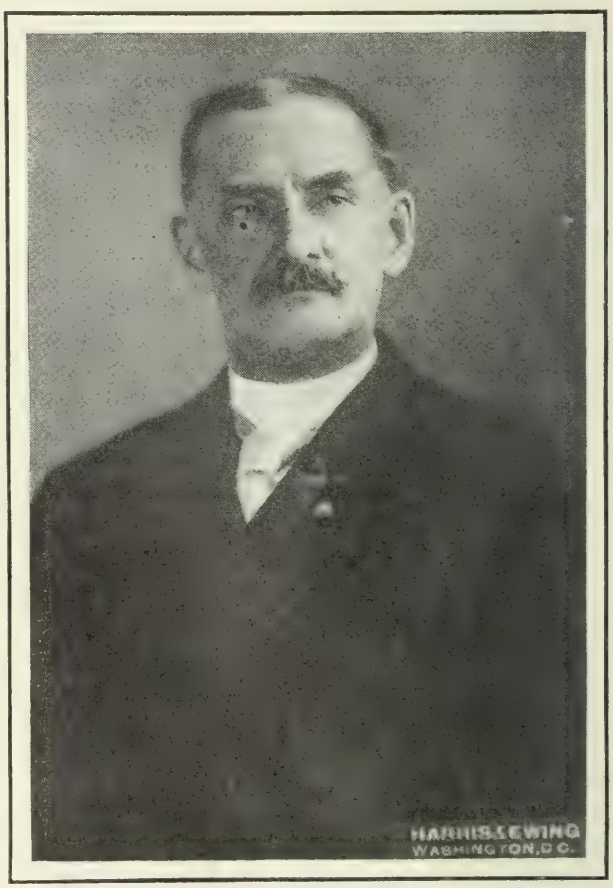
In Carmi Thompson, President Taft for the first time has selected a man with political and administrative experience as his confidential adviser. Carpenter he brought with him from the War Department. Norton and Hilles he took from the Treasury, where they had gone from private life, with no earlier political training. Carmi Thompson came from the Interior Department, where for two years he has been Assistant Secretary of the Interior; but before that he came from Ohio, where he had been Secretary of State, and before that Speaker of the Ohio House of Representatives. He was elected to the House of Representatives in 1903 and has ever since been an active force in the political arena. He enters the President's official family with a wide and successful experience in the difficult game which now, if ever, needs a cool, wise head—and apparently the President has found it in Mr. Thompson.

The new secretary was born in Wayne County, W. Va., September 4, 1870. He is not a large man, but perfectly built for endurance, activity and accomplishment. His cordial, democratic affability, his quiet, imperturbable self-control, his pleasant, smooth-shaven face, with quick, keen, laughing eyes, go a long way toward winning for him immediate goodwill, and help him amazingly in carrying out the characteristic tendencies of a strong mouth and firm jaw. Thus far he has won his way with celerity and made good to the satisfaction of all who have put faith in him. He is only upon

CARMI A. THOMPSON
Secretary to the President

the threshold of his new and most difficult task, but all who wish well for the present Administration agree that the President has made a good selection.

His experience has not been wholly in politics, for he began life as boy helper in the brick yards and coal mines of Virginia, where the Thompsons have been in force ever since the days of George III, when three Thompson brothers came over from Ireland, landed in Baltimore, and fought so well in the Colonial army that at the close of the war Captain Thompson, great-great-grandfather of Carmi Thompson, was given a large grant of land in Virginia, which is now known as Wayne County, West Virginia. Fighting has run in the blood of the Thompsons. Ancestors of the President's secretary were in the war of 1812, in the Indian wars, on both sides in the Civil War, and Carmi Thompson himself won the rank of colonel in the Ohio National Guard, and was captain, in active service, in the war with Spain. He worked his way thru school and college and is rather proud of the fact that he entered the State University at Columbus with $36 and graduated with $38 as his entire possession. He graduated from the university in 1892 and from the law school in 1895, practicing law till 1903, when he was sent to the Legislature and the School of Politics.



This is a good record and the chances are strong that the new secretary will live up to it.

Eugene Tyler Chamberlain

COMMISSIONER OF NAVIGATION.

The awful shock of the Titanic disaster served to draw the attention of the public closer to the work of those officials who are devoting every energy to securing the safety of the sea. We are more intent for the moment at least in watching them and more interested in their work, but the better we examine it the more we shall appreciate that it did not require the wreck of the Titanic to inspire them—that strong and earnest forces have long been pressing forward laws, and rules, and urging legislation for the preservation of life and property on the water.

Foremost among these agents is Eugene Tyler Chamberlain, who has been

EUGENE TYLER CHAMBERLAIN
Commissioner of Navigation

Commissioner of Navigation ever since his appointment by President Cleveland in 1893. He has played an important part in all legislation pertaining to navigation and has held many incidental offices along the same line, so that in instigation as well as execution we are indebted to Mr. Chamberlain. He was secretary of the American delegates to the International Marine Conference of 1889 and was more than instrumental in bringing into operation the rules which have been so effectual on the oceans and the Great Lakes in preventing collisions. He was behind the law of 1898 for the improvement of the condition of seamen on American ships, and prohibiting the departure of unseaworthy American ships. He was one of the prime movers in pressing the importance of wireless telegraphy on merchantmen. He is one of the four honorary associates of the Society of Naval Architects and Marine Engineers, a member of the Maritime Law Association. He is known the world over thru his compilation of navigation laws and thru frequent articles on maritime subjects. He is a strong and ardent advocate of measures for increasing American shipping in foreign trade, thru "free ships," as an academic measure, and subsidies as a practical proposition, believing that they are two independent methods of dealing with two phases of the subject—both already employed by the other great nations of the world; while he has as vigorously opposed the discriminating duty policy, believing that it would involve our country in trade wars without any ultimate benefit to American shipping. He was largely responsible for checking that movement under President McKinley. He contributes a most interesting article to THE INDEPENDENT on what Congress has done and what more ought to be done for safety in ocean travel.

Commissioner Chamberlain is a clean, clear-headed, energetic, big-hearted man —a typical American gentleman; quick and concise in speech and action, immediately convincing one that he means what he says and says what he means, and demanding instinctive confidence. No better man could be found for the position which he occupies. He was born in Albany, in 1856, a son of Gen. Franklin Chamberlain, and was graduated with honors from Harvard College in 1878. After teaching school for two years he drifted from business into journalism, first as legislative correspondent for the Associated Press, then as political correspondent for New York, Boston, Philadelphia and Washington papers, then as associate editor of the Albany *Journal* and editor of the Albany *Argus*. It was a good school for the work which lay before him and in which, as Commissioner of Navigation, for nearly nineteen years he has made a record demanding the admiration and gratitude of all who are interested in maritime progress for America and Americans.

Safety in Ocean Navigation

BY EUGENE TYLER CHAMBERLAIN

COMMISSIONER OF NAVIGATION.

CONGRESS met on December 4, 1911, and within ten days both branches began work on legislation relating to the safety of ocean navigation. Weeks before the steamship "Titanic" left her Belfast builder's hands, the Senate Committee on Foreign Relations thru its chairman, Senator Cullom, of Illinois, reported two useful international maritime conventions, and the Senate Commitee on Commerce and the House Committee on the Merchant Marine and Fisheries under the direction of their respective chairmen, Senator Nelson, of Minnesota, and Representative Alexander, of Missouri, had held numerous sessions day and night. By painstaking investigation they were well advanced toward rational solutions of serious problems involving the safety of life at sea, to the existence of which the rest of the country suddenly awoke on

April 16. Had there been no shock to the civilized world, the volume and scope of the legislation of the current session of Congress relating to safety of life at sea would constitute a record which the people of any country could regard with satisfaction. In this country, where maritime affairs usually occupy but a small share of public attention, the work of this Congress has been exceptional.

The people of the United States stand in a peculiar relation to the sea. We supply more passengers and cargo than any other nation and have fewer ships. For example, the transatlantic liners carried out of or into the port of New York alone last year 1,376,000 ocean passengers, the great majority of whom were American citizens or intend to become such, yet only 41,600 of these were carried in American ships. Practically all of our laws relating to safety at sea, to be effective, must hold good on foreign ships on the high seas beyond our jurisdiction. While the power of Congress to fix the terms upon which our ports may be used is not limited except by treaty, the extent to which that power should be exercised always calls for deliberate judgment and a knowledge of conditions fixed by the laws of the nations under whose flags respectively such ships sail. To a less extent, of course, this is also true of other maritime nations with larger shares in the ocean carrying trade. International agreement and the recognition of the laws of other maritime nations, as effective in promoting safety as one's own laws, are fundamental principles in the statutory regulation of all foreign commerce, not excepting our own. Unusual progress in accord with those principles has been made this session.

1. On January 18, 1912, the Senate ratified the Brussels International Convention unifying certain rules regarding salvage and assistance at sea. The international rule of law has been changed, for instance, so that salvors of human life shall hereafter be entitled to a fair share of the remuneration awarded to the salvors of a vessel and cargo on occasions when both life and property are imperiled. Without reciting other provisions of the convention, its eleventh article is especially pertinent.

"Every master is bound, so far as he can do so without serious danger to his vessel, her crew and passengers, to render assistance to everybody, even tho an enemy, found at sea in danger of being lost."

Lord Mersey's conclusion, anticipated by the report of Senator William Alden Smith, that those on board the S. S. "Californian" saw the "Titanic's" distress signals at a distance of eight miles and without serious risk could have saved the lives of many or all derives force from the article quoted and the British law to give it effect. The bill of Senator Burton, of Ohio, to give effect to the treaty and to subject to fine and imprisonment a criminally negligent master was reported on March 12 and is the law of the United States.

2. In September another International Conference on Maritime Law will be held at Brussels to consider the subject, assigned more than a year ago, of the laws of nations fixing the liability of shipowners. The importance of the subject to hundreds of thousands of Americans who cross the Atlantic under foreign flags every year needs only to be suggested. To provide for suitable American representation at this conference, where will be assembled trained legal minds of Europe, the Senate on April 12, 1912, voted $5,000 at the request of Secretary Nagel, and doubtless the House of Representatives will concur. If progress were measured only by notoriety, these international Brussels conferences to unify maritime law, which have met for some years, could be dismissed in silence. Their initiative is in the quiet deliberations of national associations in maritime countries, composed of eminent judges and lawyers. When these associations have reached conclusions, the referendum is to an international conference and ultimately to the treaty-making authorities of the governments which participate. The result is progress so grounded in knowledge and justice that it endures and becomes the foundation for another advance.

3. Only seventeen years have passed since Marconi transmitted electrical messages without wires over a distance of two miles, yet radiocommunication already ranks first in the range of its usefulness among appliances for safety to life at sea. In November, 1906, an in-

ternational conference at Berlin, at which delegates from the United States took a leading part, formulated an international agreement for the regulation of radiotelegraphy. Its purposes were to prevent the establishment of a threatened world-wide monopoly in the use of this instrumentality and to regulate its operations so as best to serve the security of life and property on the ocean. The Senate on April 3, 1912, ratified this convention. Long before the treaty was ratified the Senate and House committees already named began the patient preparation of measures to give effect to the treaty, if ratified, and on February 15, Senator Bourne, of Oregon, reported the bill to regulate radiocommunication, which passed the Senate and doubtless will pass the House before adjournment. His measure anticipated the situation, in so far as radiotelegraphy was involved, which developed when the "Titanic" went down and the painful days which followed. One tribute to its soundness is the adoption of its essential features by the International Radiotelegraphic Conference which met at London in June—for American representation at which, by the way, Congress without dissent provided in the diplomatic appropriation bill sent to conference April 16.

4. Altho this country was slow to ratify the International Radiotelegraphic Convention, it was the first among nations to prescribe by statute wireless apparatus and operators on ocean passenger steamships. The act of June 24, 1910, which went into effect on July 1, 1911, required every ocean passenger steamer carrying fifty or more persons on a sea route of over 200 miles to be equipped with radio apparatus efficient for at least 100 miles in charge of a skilled operator. Soon after that act took effect it was naturally observed that on many steamers, from midnight to six o'clock in the morning, the operator was asleep. In November this situation was brought to the country's notice by the Hon. W. J. Bryan, on board the steamship "Prinz Joachim" on a West Indian reef for several of the early morning hours out of communication with ships equipped with wireless. On December 14, 1911, Senator Hitchcock, of Nebraska, introduced a bill to require after July 1, 1912, a constant wireless watch upon ocean passenger steamers carrying 100 persons or more. This bill, amplified to require the constant watch on ocean steamers carrying fifty or more persons, whether passengers or crew, and auxiliary apparatus for use if the ship's dynamos are disabled, is a law. Its principles also were adopted at the London Radiotelegraphic Conference and doubtless within a year will become the common rule of the sea.

The "Titanic" sank in the early hours of Monday, April 15, 1912, and her fate became known to the country late that night and on the following morning. The work of Congress, begun, well under way, or completed before that date, has been outlined. The disaster, of course, was followed by the introduction of a flood of bills—fifty-four—at least some of which indicated a zeal for humanity outstripping the knowledge needed really to safeguard life.

On April 18, Representative Alexander introduced a joint resolution, which is now law, providing for an international conference,

> "the purpose of said conference being to consider uniform laws and regulations for the greater security of life and property on merchant vessels at sea, including, if practicable, regulations to establish standards of efficiency of the officers and crews of merchant vessels and the manning of such vessels; regulations for the construction and inspection of hulls, boilers and machinery; regulations for equipment of ocean steamers with radio apparatus, searchlights, submarine bells, life-boats and other life-saving and fire-extinguishing appliances; regulations concerning lights, sound signals, steering and sailing rules; regulations for an international system of reporting and disseminating information relating to aids and perils to navigation; the establishment of lane routes to be followed by trans-Atlantic steamers; and such other matters relating to the security of life and property at sea as may be proposed."

Assent to this proposition is world-wide—indeed, it was the first formal expression of the intelligent sentiment of both sides of the Atlantic that from such a conference more substantial benefits would ensue than from the action of any one parliamentary body. The problem before the international conference, as indicated in both the Alexander resolution and the recommendations on July

30 of Lord Mersey's commission, fall into four classes relating to: (A) Rules of navigation; (B) equipment of ships; (C) structure of ships; (D) efficiency of crews.

(A) *Navigation.*—Lord Mersey finds, as did Senator Smith, that the "Titanic's" speed was excessive. The conclusion was inevitable, for in 1903, in the case of the collision between the steamship "Kincora" and the steamship "Oceanic," reduced to 6⅓ knots speed, Lord Chancellor Halsbury had observed:

> "Here is the 'Oceanic,' the largest ship on the ocean, and the fact appears that she was going at a pace which she could have made more moderate if she had liked. If she had moderated it no collision probably would have taken place. She was going at a speed which rendered it impossible to stop within the limit of observation. . . . I entirely agree that the power of stopping is a test to be considered, and is one of the circumstances which any tribunal ought to take into consideration when determining the question whether a ship is traveling at a moderate speed or not."

The international rules to prevent collisions prescribe moderate speed "in a fog, mist, falling snow or heavy rain rain storms." There is no prescription for moderate speed or change of course in clear weather in the region of ice, the need of which has been demonstrated. The lack of such a rule sustains the British finding that in maintaining speed in the face of ice warnings the "Titanic" was navigated "in accordance with the long existing custom due to competition and to the desire of the public for quick passage rather than to the lack of judgment by navigators."

Risk always will attend in spring and early summer northern transatlantic routes so long as fog and ice imperil navigation, and so long as passengers demand cool and "record voyages" and there is economy in the shorter routes, steamship lines will doubtless use them. Twenty-three years ago the Washington International Marine Conference, reciting the difficulties in the way of establishing compulsory transatlantic steamship lanes, decided that "even in the near future vessels may be employed of such power and speed that all such considerations may have to give way to the paramount consideration of safety." Radiotelegraphy now provides communication between the coast and the transatlantic liner thruout her voyage and instant general notice of any peril. It is now feasible for the principal hydrographic offices from day to day to determine the lanes of safe navigation and to notify at least the principal ships in transit of changes in such lanes. An international statutory obligation to heed such warnings and follow routes so determined would be welcomed by the masters of steamships. It is improbable that commercial and maritime organizations would object to such compulsory ocean lanes, tho occasionally discrimination between seaports might result. The problems of navigation brought forward by the disaster are international, and in directing attention to them Congress has already exhausted its powers for the present.

(B) *Equipment of Ships.*—The legislation of the present session will provide a constant wireless watch on ocean steamers, a complete chain of American wireless coast stations constantly alert from Maine to the Canal Zone and from the Zone to Alaska, with branches, so to speak, to Porto Rico, Guantanamo, Hawaii, Tutuila, and the Philippines; and a general use of this instrumentality, regulated in the public interest. Furthermore, other nations have already committed themselves to the principles of our legislation, and it remains only to determine details at the coming conference.

Perhaps the recent prominence of searchlights is partly due to the report that, while Prince of Wales and sailor on a British man-of-war, King George V witnessed the "picking up" of an iceberg dead ahead by the ship's searchlight. The majority of experienced transatlantic captains oppose searchlights, partly from dread of the dangers involved in their indiscriminate use, and partly because they cannot be used in the fog or haze which often hangs over ice-strewn seas. At the bow they were given up long ago, and even when on the bridge the eye of the officer, fixed on the dazzling ray ahead, does not readily adjust itself to surrounding darkness and discover the objects it may enshroud. Careful navigators extinguish every light forward which might affect the watch officer's vision. Searchlights are, of

course, required thru the Suez Canal, but masters who have experimented with their use afterward in the Red Sea do not recommend them. Their blinding effect, when thrown upon the bridge or pilot house of another vessel, is so dangerous that the American regulations put on trial for his license an officer who thus intentionally misdirects the rays. Of course, they serve to pick up buoys or discover the whereabouts of a man overboard at night, and on warships are part of the defense against torpedo boat attack. Whether searchlights should be recommended for the North Atlantic is a question for scientific research, involving optics, chromatics, light and shade effects, and possibly a modification of Darwin's theory of protective coloration. Mr. Albert H. Thayer's studies on the subject doubtless are known to THE INDEPENDENT, and the results of investigation here and abroad will be available at the international conference. Congress during a Presidential year could not be expected to investigate it, and, of course, would not legislate on international lines without investigation.

In 1871 Congress enacted that every steamer navigating the ocean or our lakes, bays or sounds shall be provided with such numbers of lifeboats, rafts, etc., "as will best secure the safety of all persons on board such vessel in case of disaster," and bestowed upon the Board of Supervising Inspectors of Steamboats the power to determine the kind of such boats and rafts. Later legislation applied this law to foreign ships, and a still later act provides that foreign laws "approximating those of the United States" in this and other respects shall be recognized. Our laws contain few such comprehensive delegations of power, but the lifeboat problem is treated in substantially the same manner in other countries. It presents some difficulties in administration, here and elsewhere, which additional legislation could not remove. Such legislation could direct the discretion now vested in administrative officers, but could not add to safety to life, if that discretion is prudently exercised. No charge against the manner of its exercise in this country has been established. On the ocean lifeboats for all will presumably be an administrative rule, here and abroad, before the international conference assembles.

(C) *Structure.*—Writing in May, Sir William H. White, the world's most eminent ship builder, said: "When natural excitement has disappeared and calmer consideration is possible, it will be seen that boat equipment, important as it is, must be treated as subordinate to efficient water-tight subdivision." The sole matter for regret is that Congress has not provided for a commission of the best experts to report on hull construction, bulkheads, transverse and longitudinal, double skins to the water line, water-tight decks, water-tight doors and means of closing them. Senator Nelson's brief bill on that subject may yet be passed. An investigation of these subjects, ordered in England in May, is in progress. A simliar examination in Germany after the loss of the steamship "Elbe" in 1895, covering many months, resulted in the rules concerning bulkheads, etc., of the *Seeberufsgenossenschaft,* generally regarded as the best on the subject, tho their modification will now be probable.

The international conference undoubtedly will lead gradually to improved bulkhead and hull construction. New structural rules cannot, except in slight particulars, be applied to existing ships or those nearing completion. When formulated they must endure for many years, because changes cannot be made at random. To preserve fair competition they must be international in application and they must recognize the necessities of commerce. The formulation of such rules and their adoption by nations will not be brought about in one year or two, but the result when attained will testify that the lesson has been learned of the "Titanic" disaster.

(D) *Efficiency of Crews.*—In his report of January 2, 1912, the Hon. Charles Nagel, Secretary of Commerce and Labor, recommended that "the law governing the personnel of crews should be strengthened so as to afford better guaranty, more especially as to the fitness of men so employed." The reports of Senator Smith's committee and Lord Mersey's commission disclose only one instance of plain dereliction of duty among the 976 men and twenty-three

women comprising the crew of the steamship "Titanic." At the same time both reports disclose the lack of fitness for their duties in emergency on the part of some of the crew. Statutes and material things, bulkheads and water-tight doors, lifeboats and searchlights, derive their value solely from the intelligence and skill which make use of them. The difficulty in securing trustworthy seamen here and abroad is much greater than the difficulty of enacting and carrying into effect laws governing the structure, equipment and navigation of ships. The difficulty is inherent in the change from sail to steam. The former stimulating life on deck in the salt air the majority of the crew has been forced to exchange for the tedious task of shoveling coal deep in the hold. The chance of independent command and even of an officer's berth decreases with every year's increase in the average size of steamships. The truth may be met frankly that life at sea has changed and that the men who lead it have changed also. Statutes and customs of the sea have not worked this change, for the laws of forty years ago were tyrannical by comparison with those now in force, and harsh treatment, too frequently the rule then, is now the rare exception under provocation. Much has been done and much can be done to ameliorate the conditions of labor at sea, but it is vain to hope that such changes will bring back before the mast the race of men who made famous the American clippers and established England's maritime supremacy. For statutory improvements relating to seamen we may consult with advantage the German laws. Yet the German seaman's ordinance derives, in part at least, its efficacy from the military system which obtains thruout the Empire with the rigid discipline it imposes from boyhood.

"The duty of the lookout," in repeated decisions of our Supreme Court, has been declared "of the highest importance. Upon nothing else does the safety of those concerned so much depend. A moment's negligence on his part may involve the loss of the vessel with all the lives on board." Since 1905 a seaman cannot serve as lookout on a German ship unless he has passed an examination as to range of vision and freedom from color blindness. In 1909 the Netherlands adopted the same law. Neither the United States nor Great Britain imposes so elementary a prescription.

Nearly every observant transatlantic voyager, regardless of the ship's flag and with rare exceptions, long ago reached the conclusion that the boat drill and fire drill at sea was rather the perfunctory compliance with regulation for the entertainment of passengers than practice in the discharge of a duty upon which might at any time depend the lives of all aboard. It is perhaps important to dock in time to catch the train for Paris, Berlin, London or Chicago; but occasionally it might be worth while to stop in mid-ocean, and put every lifeboat over the side and into the water. Reproduction of the actual conditions of abandoning the ship would soon prove a better test of able seamanship than any which statutes or regulations could prescribe.

At the same time, the very conditions already mentioned suggest in this country a statutory division of seamen into the two classes, able-bodied and ordinary, *Vollmatrosen* and *Leichtmatrosen,* as provided in British and German laws respectively. It is a matter of regret that the "seamen's bill" of Representative W. B. Wilson, of Pennsylvania, which past the House of Representatives, should have its practical benefits so obscured by provisions literally impossible of fulfilment that in effect it would result in disorganization at a time when the need of efficient seamanship has been brought home to the whole world. The measure furnishes, however, a basis for matured improvement in the navigation laws.

WASHINGTON, D. C.

The Festival Course at Dartmouth

BY PROF. CHARLES F. FARNSWORTH

[The growth of the art of pageantry is shown by its introduction as a regular course in the Dartmouth Summer School by the author of this article, who is Professor of Music in Teachers' College, Columbia.—EDITOR.]

THE offering of a course in the practical study of the festival at the Dartmouth Summer School is of special interest because in connection with the course a practical demonstration of the festival is being given in the little village of Thetford, twelve miles from the college. Those who are giving the course are actively engaged in the Thetford festival, and the course closes with the production of the festival as a partial demonstration of what has been presented in the lectures.

The following are the titles of the lectures:

The Philosophy of the Festival.

The Modern Pageant.—The Drama of the Community.

The Festival Story: (a) Available Materials. (b) Practical Suggestions on Preparation.

Festival Dancing: (a) Types of Folk Dance. (b) Interpretative and Dramatic Dancing.

The Festival and the School. An Opportunity in Correlation.

The title of the festival given out of doors on Saturday, August 3, is "The First Fire Maker." It represents by poetry, acting, dancing, costume and pantomime the importance of fire in the home and society, and woman's relation to the fire, from work at the hearth to work in the factory, with poetic suggestion as to the future. The poetry, music, dancing and costumes have been worked out by the group of festival students on Thetford Hill. The story of "The First Fire Maker" starts out with the sunrise hymn of a primitive people living in the woods, having hunting and some tools, but no fire. With song and dance the men go off to hunt, while the women give expression to the monotonous drudgery of domestic work, till one of the maidens succeeds by friction in starting a fire. This excites them to joyous song. The hunters return and are astonished to see the flickering blaze shining on the trees and huts about them. A seer suddenly springs forth and foretells what fire will do for the race:

"Whose hand above this blaze is lifted
Shall be with magic touch engifted,
To warm the hearts of lonely mortals
Who stand without their open portals.
The torch shall draw them to the fire
Higher, higher by heart's desire.
Whoso shall stand by this hearthstone
Shall never, never stand alone:
Whose house is dark and bare and cold
This house of ours will sure enfold."

Apart from those who are directing the festival, all the acting, dancing and music are given by the girls of the camp assisted by those of the village about. It is rarely that the relation between what is advocated in lectures and the working out of what is advocated in actual doing is better illustrated than in the course at this summer school and the village festival of Thetford.

With reference to the acting and dancing, three main ideas have been presented. First, a preliminary drill in rhythmic movement, showing what motions tend to express lightness and freedom, was given. When the class had some mastery over themselves in simple movements, the second idea was introduced, that of suggesting a motive such as the movement of birds, the flickering flame, running water, or a curling wave, and the pupils exprest in their motions what they imagined in relation to the themes given them. When some mastery in such simple ideas had been gained a connected story requiring some organization of varying moods for its expression was given to the class, and when their minds were filled by description and explanation they were asked to work out their expression of the significance of the story. This scheme makes the greatest demand on the imagination, intelligence and ingenuity of the student, and for this very reason does not lend itself to that precision and regularity of motion that is possible where the idea is

worked out entirely by the instructor and the pupil simply is taught how to carry it out.

In the conventional dramatic dancing there is practically a language of symbolized motion which the student learns and applies to what she wishes to express. Even M. Jacques Dalcroze, who is attracting so much attention just now, teaches certain fundamental motions expressive of joy, fear, aggressiveness and shyness, which the student first learns and then puts together when an idea or a story is to be acted out. Highly developed skill in the form of the expression can thus be developed.

But it is obvious that from the educational point of view the more simple and direct appeal to the imagination of the people must be of greater value, tho as a set performance to be viewed by those who are accustomed to professional work much of the work will seem crude. The value, however, with reference to the intelligent and artistic feeling of the dancer is so much greater that the method advocated is of special worth for festival performance. Take, for instance, the "Fire Dance" of the Thetford festival, given by girls ranging from ten to sixteen years. The director told them the story of the play: how a strange visitor brought fire down from the heavens, and the simple folk who had seen the sun and lightning, but had never been able to make a fire, first gathered around the blazing wood, looking on with astonished curiosity. After the story the instructor's question was, "What would you do if you were in the place of these people?" and the response was, "We would run up to feel of it." "Then what would you do?" "The fire would burn us, and we would start back, and then go up more cautiously." "How then would you show in your dancing the characteristics of the fire?" Thus from the motives of the actions of the observers and the dancing, flickering flame the fire motive was worked out, and represented by a gentle running with a sudden stop and short return, with the upward swinging of the arms in flamelike motion.

A second dance was that entitled "Electricity," in which each dancer represented a bulb of light. Here was a rich theme for the imagination of the

PREPARING THE PRIMITIVE COSTUMES FOR THE "FIRST FIRE MAKER"

DANCE OF NATURE SPIRITS, THETFORD PAGEANT, 1911

class. Capes were worn over the bright costumes, gradually thrown back to represent the brightening blaze. While the general idea was the same, each individual was working it out from her own point of view. One of the youngest members of the class suggested that the electric lights sometimes grow dim and then brighten up again, and this slowing down and covering up only to break forth into more active motion gave the needed variety to the whole.

Another dance represented steam. The motive for the motions was worked out from the steam escaping from a locomotive—the sudden jumps, the circling curl, and the gradual vanishing as it mixt with the smoke of the engine. Long, flowing draperies were worn by the dancers, having the various shades of steam and smoke. Floating veils represented the final escape of the steam into air. Here again at every step appeal was made to the imagination of the students, and much interesting ingenuity was exhibited in details of movement and suggestions for color. In fact, if one should have visited Thetford a few days ago, he would have found the lower end of one of the fields turned into a dyeing establishment. There, under the open sky, the girls were dyeing their own draperies; and to view the fascinating combination of colors that have resulted one could not help but feel that the enthusiasm and interest of the workers had got into the hues themselves.

One of the main points made at the Dartmouth course was that the festival should be thought of not as an entertainment at which the people were to look on while experts did the dancing, acting and singing, but that it could only be a festival as it was the expression of the feeling of those who were giving it. Hence a sharp distinction should be made in viewing and judging such a work as compared with professional work. The festival feeling could only be kept pure as attention was drawn to the spirit and not to the form, to the significance and not to the manner. As soon as precision of movement and skill of technique are made important, the teacher has to determine everything and the pupils become puppets, learning to do certain motions exactly. That such work often attracts applause and attention, especially

THE ELECTRIC LIGHT DANCE IN THE MAKING

by unthinking people, is admitted. It is judged in comparison with what one sees in vaudeville. Thus the poetical standard is lost and the value of the work as a factor in education almost entirely destroyed.

The same thought ran thru all the different lectures of the course, determining not only the method of handling but the choice of subjects. The lecturer, in classifying the suitable festival motives, gave four groups: Thanksgiving, with its expression of the reward of human industry; the Christmas and New Year festivals, bringing out the family and ethical relations of the individual; the third, the patriotic festival connected with the Lincoln and Washington birthdays, bringing out the national feeling; the fourth, the May Day festivities, emphasizing the goodness and beauty of nature in the return of the flower and fruit. The purpose in dwelling on these four great festival periods was to read a new and vital significance into the beautiful symbolism that has come down to us from the past. Here again the aim of the lecturer was to have the subjects of these festivals so presented to the children that were to give them that they would re-interpret the forms they were to use with the meaning that they felt themselves; and again, as in acting and dancing, the emphasis would be not on the finished performance but on genuineness of the individual expression.

Such work demands a different spirit from that often found in schools where the ideal is uniformity and exactness in memorizing. To carry out festivals as here advocated would mean almost a revolution in most schools. The teacher, instead of being one who dispenses knowledge or listens to the accounts of what children have learned in books, would simply be a leader among a group of investigators, every one taking part, every one working intensely, because what they are doing has vital connection with their own interest. Such kind of work, when watched from the outside, seems to lack in efficiency, because every student does not move with that uniformity that one sees in the motions of the gearing of a machine shop. Pupils and teacher interested in the subject are not attending to the formal side of school discipline. Hence, just as in viewing the performance of a festival, given in the spirit advocated in these courses, the position and form of what is done is sacrificed in order to gain freedom and spirit for the individual expression. When the spectator has once awakened to the true significance of such work, the pleasure gained from seeing its expression stirs us profoundly and is not to be compared with that amused interest which comes from viewing skill in performance, whether in the festival or in the school room.

The creed, then, of the Dartmouth Summer School, with reference to the festival, with its practical demonstration work in Thetford, is: "Think and do the thing yourself; let it be an expression of your own feeling," and as far as this is sincere and the work true, the form will prove adequate and interesting.

THETFORD, VT.

Logic Versus Life

BY F. C. S. SCHILLER, M.A. D.Sc.

[Dr. Schiller, Fellow and Senior Tutor of Corpus Christi College, Oxford, is well known to the public as the leader of the pragmatic movement in England. In his earlier works, such as "Riddles of the Sphinx" and "Humanism," he has attacked many of the dogmas of traditional metaphysics, but his latest work, "Formal Logic," is in some respects the boldest and most revolutionary of all, for in it he seeks to show that logic as it has been taught in the schools from Aristotle to the present day is "inconsistent, incompetent and meaningless." In this country comparatively little attention is paid to formal logic even in the universities, but it is popularly assumed here, as Dr. Schiller shows that it is by the English press, to be a certain method of arriving at absolute truth. Schiller's "Formal Logic," which was reviewed by Prof. John Dewey, of Columbia, in THE INDEPENDENT of July 25, is a very technical and extensive work, so our readers will welcome the following article in which the author explains in untechnical language one of the chief points in his indictment. We shall publish later an account of Dr. Schiller's philosophy in the series on "Twelve Major Prophets of Today," which Dr. Edwin E. Slosson is writing for THE INDEPENDENT.—EDITOR.]

TO the untutored innocence of the natural man the immaterial creations of the human spirit have always been somewhat uncanny. Arithmetic, geometry, grammar, logic, are nothing visible or palpable, and so their achievements savor of magic. When the Greek sages began to reflect on the nature of arithmetic, Pythagoras soon maintained that "all was number"; Plato, too, seriously considered whether numbers were not the ultimate essences of all things, and ever since the mystical properties of numbers have been objects of reverential contemplation. To the Roman mind a "mathematician" seemed indistinguishable from an astrologer or a magician, to consult whom about the emperor's health had to be made a capital offense, and at whom even an enlightened historian like Tacitus could hurl the epigram that he was one "whom those that had power could not trust, while those who aspired to it found him treacherous." All thru the Middle Ages similar beliefs ran riot. The multiplication table seemed fraught with infinite significance for human welfare. A simple geometrical diagram could keep the devil from the door, who in those days was far more feared than the wolf. The conveying of ideas by writing was a mystery, and the rude "runes" of the Teutonic script soon grew into the "baleful signs" of a system of magic. Grammar was an occult art, which enveloped in its "glamour" all the literate, and whoever could spell might reasonably be suspected of fabricating "spells"! The status of a learned man, consequently, was extremely high; he might be feared and hated, and upon occasion lynched as a sorcerer, but at any rate no one dared to speak disrespectfully of his arts and craft.

Nowadays we have changed all this. We think that the magic of mathematics is all nonsense, and that we have escaped from the magic of words. Few would hesitate to speak disrespectfully of the Equator, and the Signs of the Zodiac are no longer household terrors, familiar to the man in the street. Even the Syllogism prefers to lead a secluded life in academic groves, and no longer interposes its irresistible cogency in the disputations of the market place.

The effect on the status of the learned has been disastrous. Our professors, if they wish to be recognized as such, have to wear medieval gowns. If they want to be admired, they have to manufacture their own mysteries and to enfold themselves in a thick fog of technical terminology; and even then the world pays little attention to them, unless they can manage to evolve something which has real importance for practical life. And as the professors of the literary arts dare not do this, they would have a bad time, and could hardly make a living, if their subjects did not providentially happen to be endowed.

Logic alone of all these arts still retains its medieval prestige almost unimpaired. It is still surrounded by a halo. Its mysteries have never been profaned. The vulgar gaze has never been allowed

to see what is in it. So it is still credited with the power to do harm. It is "cold," "cruel," "ruthless," a "relentless" foe that "breaks" whoever dares to question it and "betrays" those who put their trust in it. The London *Spectator* still periodically issues solemn warnings to those who argue "logically" when their premises are false. For whereas "bad logic might get a right conclusion out of unsound premises, it is absolutely impossible that good logic should do anything but lead us wrong if the premises are faulty." So, tho even the worst textbook would disclaim this doctrine, even good logic is, like good magic, dangerous, or at best useless. For apparently, unless we know already that our premises are true, logic is no help; while if we do, it seems a superfluity, because we must *already know* the truth of our conclusion. Nevertheless, the *Spectator* forms an impenetrable screen for logical orthodoxy, and is as resolute as the *Times* that no criticism of the logical tradition shall reach the public ear.

This tradition is indeed a noble one. That the same doctrine, in perfect verbal continuity, should have been taught and examined on for over two thousand years would be the most stupendous fact in education, were it not surpassed by the still more surprising fact that during all this time no one has arisen to call it nonsense thru and thru, and that every would-be improvement has been countered by the retort that it was "not in Aristotle." So logical "progress" has consisted in a perpetual return to the Greek originator of the subject. What could illustrate more strikingly the debility and the perversity of human intellect, and both its gratitude and its ingratitude to the gifts of genius?

Yet the gratitude has been more conspicuous. The great mass of logicians have always been true to their salt. For Aristotle is still very heavily endowed.

In the University of Oxford alone three philosophy professors, twenty-eight *literæ humaniores* tutors, and about 460 classical scholars and exhibitioners are paid, at an annual cost of over £50,000, to believe that the theory of thought has stood still, or stumbled into error when it tried to move, ever since the composition of the "Organon," and that all modern science may be read into and out of the obscurities of the "Posterior Analytics." The Secret Doctrine in which this is taught has never been divulged in print, but examiners know that there are passages in the ordinary Oxford Logic Lecture which must have been copied down by two hundred generations of students ever since the twelfth century.

Quite naturally, spontaneously and honestly, therefore, rises the cry, "Back to Aristotle!" It means exactly what "Back to St. Thomas Aquinas!" means in a scholastic philosopher, and, as regards logic, the difference between Aristotle and Aquinas is not important. Between them they have bound the Titan, Thought, and keep the human race in bondage to a meaningless tradition. The revolt of Science against Authority, of Humanity against Pedantry, of Action against Verbiage, of Life against Fossilism, can never be successful until the spell of the logical tradition is completely broken, and a logic is constructed that consents to remain on speaking terms with human thinking. Broken this spell must be if there is to be intellectual progress, and the indications are multiplying that broken it will be before long.

The irony of fate has even willed that, in spite of every discouragement, the movement for the reform of "logic" should have broken out in Oxford also, and the present writer is so deeply committed to it that he can even put intelligibly his reasons for upholding the "heresy" that the whole logical tradition is utterly erroneous.

Space, however, will allow the consideration only of two of the cardinal points on which the whole structure of Formal Logic rests, to wit (*a*) the Syllogism and the notion of Valid Inference; and (*b*) Scientific "Proof" and formally valid "Induction."

(*a*) The peculiar aim of logic hitherto has been to discover a form of "valid inference." By this was meant a form of words so *fool-proof* that it could not be *misapplied*, and that the use of it would absolutely guarantee the soundness of the conclusion if only the reasoning had been fortunate enough to start from true premises. In the syllogism it was supposed that such a form had been found. From *all swans are*

white and *this bird is a swan* it was to follow inevitably that *this bird is white,* and the course of nature would eternally conform to the prophetic demonstrations of logic.

Yet logicians also had soon to note that even formally there was something wrong about this syllogistic form. It seemed to "prove" what was either nothing new or nothing known. To justify the "major premise" *"all* swans are white," must not its assertor have already seen *this* swan and *know* that *it* is white? Or, if he did *not* know this, is he not *risking* an assertion about some "swans" on the strength of what he knows about others? And what right had he thus to argue from the known to the unknown? Can an "inference" be "valid" if it involves a *risk?*

When therefore *black* swans arrive from Australia to upset his dogmatizing, what is he to do? Will he say his major premise was a definition, and no bird, however swan-like, shall be *called* a "swan" if it cannot pass his color-test? If so, his reasoning is still caught in the old dilemma, that he either "proves" nothing *new* or begs the question in another way. For he then had no right to assert his "minor premise," *this bird is a swan,* if he knew not it was white. Or will he, desperately, say "in both of these interpretations the syllogistic form is fatuous; but kindly understand it as asserting a *law of nature* which is immutable, and applied to the particular case in the minor premise." But, if so, how does he know that his "law" applies to the "case"? that the "case" is such as he takes it to be? that he has picked out the right "law" to deal with the case and formulated it correctly? If it is quite certain that the "law" applies to the "case," his conclusion proves nothing new; if it is not, he runs the risk that the case of which he is trying to predict the behavior may be so exceptional as to break or modify his law. And if he runs that risk, is he not renouncing his ideal of reaching fool-proof certainty?

There seems to be *no* way, therefore, of saving "valid inference," of so interpreting the syllogism that it is both formally valid and humanly instructive. If it is to be instructive, it can only enlighten human ignorance, and then its premises *cannot* be *certainly* true. Hence the conclusions of the most cogent "demonstrations" will still have to *come true in fact.* The scientists are well enough aware of this. An astronomer may calculate the path of an eclipse to half a mile and half a second, but he does not think it superfluous to observe *how nearly* his predictions are verified in fact.

Hence (*b*) his notion of "proof" differs radically from that which the logician tells him he must employ. He does not dare to beg every question that science is concerned with by assuming that the *real truth* of premises can be taken for granted, and taken as absolute, and that therefore logical forms can henceforth be treated in abstraction from the truth, in point of fact, of actual judgments about real questions. He is unendingly engaged in testing and confirming his stock of "truths," and modifying them from day to day. They enable him to make his predictions more and more exact; but tho he believes them infinitely perfectible, he does *not* regard them as absolute. So he *never* gets to the point from which the logician makes bold to start, viz., assurance absolute of the truth of premises, and cannot hold that the latter's procedure has any relevance to the work of science.

He has to complain instead that the notion of *relevance* has so completely escaped the notice of logicians that they actually prescribe canons of scientific "proof" which are nonsense unless the relevance of the facts argued from is presupposed, while yet ruling out as arbitrary, risky and "invalid" all the procedures by which the sciences try to assure themselves of the relevance of their "facts." He finds, *e. g.,* that the logician insists on demanding that scientific "induction" shall be reduced to a valid form that eliminates all risk of error, and tells him that he should argue from all the "cases" and find cases in which *all* the circumstances but one are the same or different, and when he ventures to point out that all this is scientifically impracticable and that no science attempts to be all-inclusive, and every science *selects* what it judges to be the relevant facts for its purpose, and takes the risks of omitting something relevant and including something irrelevant in so doing, and lastly, that he *does not want*

"valid forms" of induction, because an inference which is in no danger of proving false has no chance of proving valuable if true, he is exposed to the logician's sneer that evidently science cannot attain to the "ideal" of logical proof, and should confess its inferiority to "metaphysics."

But what if the scientist should refuse to be browbeaten thus any longer, and declare that it is the logician's analysis which is wrong and false to the procedures of science, and, in general, of life? It is not improbable that the logician would get the worst of it. But it is becoming so clear, not only that *no* scientific doctrine makes itself *unimprovable* by claiming absolute truth, that every thought is conditioned and stimulated by a doubt, that every judgment is a decision and a choice between alternatives, that every act involves a risk, and that every thought is an act; but also that, unless these facts are admitted, the logical facts themselves become sheer nonsense.

The logician has been in the habit of starting from ready-made syllogisms and of putting aside the question how these curious structures came into existence. But had he permitted himself to raise this question, he would have seen that no magical bond of "logical connection" could have super-psychologically conjured them up out of the void. The premises of every reasoning have somehow to be selected and combined, and whoever achieves this thereby renders himself responsible for the syllogism, and would not and could not have done so had he not judged it relevant to some purpose he was realizing. There is no reasoning about white swans or blue bottles, or even about the eternal truths of mathematics, unless and until some doubt or question has arisen about these things. This is why we do not in real life go about reciting the multiplication table or any other truth we have reason to think undeniable.

To abstract, therefore, from these *personal* presuppositions of the logical structure is to extract its real meaning and to reduce it to a *collocation of words,* which may again *become* a vehicle of meaning if some one judges it good to use it, but in fact *means nothing.* It is not, therefore, a reasoning at all, and does not illustrate the nature of reasoning. Yet logic hitherto has always substituted such forms of words for real reasonings. It has in consequence become a game with symbols, which are traditionally words, but do not become more significant by being eked out and complicated by the magical hieroglyphs of "symbolic logic."

Is it not strange, then, that this play of illusion should continue to impose on the human spirit? Ought not "logic" at last to be taught to know its place, and to become, like grammar and geometry, a servant to the human race to which it owes its being, an instrument for calculating the course of events, and a means to the ends of human life? Such a logic is not as yet in being, but to construct it would be an inestimable service to human knowledge and to human power.

CORPUS CHRISTI COLLEGE, OXFORD.

The Saving

BY IVAN SWIFT

THE rose that bloomed but yesterday
And gathered to its lips the dews
Of heaven, is strewn upon the way
That men profane and storms abuse.

Its heart and yours cannot but choose
The blight the evil seasons set;
And as their gladness gardens lose,
Your tender cheeks with tears are wet.

Mayhap the flowers fade with pain
And fall from vine and life alike;
But come the Spring and deeper rain
To quicken grief and withered spike.

The winds that burn across the heart
Are keen but kinder than we know—
They rend the bloom and branch apart,
But seeds to farther sands will blow.

The vainer symbols come and go,
But nobler gifts shall vie with chance;
A lonely soul in faith may grow
And love outlive earth's circumstance.

HARBOR SPRINGS, MICH.

Swedish and Finnish Achievements at Stockholm

BY HERMAN MONTAGU DONNER

[How the folk life of the Swedes and Finns enabled them to beat other nations at the recent Olympic games is explained in the following article. Mr. H. Montagu Donner is a native of Finland and the nephew of the late Senator Otto Donner, for twenty years a member of the Finnish constitutional Diet, and, at the time of his death, the oldest member of the Mechelin Government of 1906-9. He was educated in England and Zürich, Switzerland, but has been a naturalized American citizen since 1900. In his school days he was on his college cricket and football teams, and has taken a lively interest ever since in all forms of athletics. Recently he made a tour of Finland, besides visiting Stockholm, and has lectured on that country extensively, besides contributing various articles on Scandinavian subjects to the American newspapers and periodicals. He is also the author of a volume of poetry, entitled "English Lyrics of a Finnish Harp."—EDITOR.]

NOTHING in the recent Olympic games at Stockholm has made quite as deep an impression as the remarkable showing of the athletes of Sweden and Finland. The success of the Americans was fully expected, and therefore to just that extent discounted; but not even her most fervent admirers ventured to predict what Sweden actually succeeded in accomplishing, viz., the ousting of the United States from the pride of first position, which was brought about at the conclusion of the aquatic sports, on the very last day of the games. And little Finland not only successfully took the measure of the mighty nations of Germany and France in the total number of points gained, occupying fourth position in the end, but came in second only to America in the field and track events, by many considered the most important part of the whole athletic carnival. Twice did the Swedes, and once the Finns, have the supreme satisfaction of sweeping the board in an event: Sweden in the modern Pentathlon and the hop, skip and jump; Finland in the javelin throw with both hands. Also, in the field and track events, Finland twice and Sweden once carried off two of the three medals!

The Indian Tewanima

These achievements are in themselves remarkable, but when one takes into account the fact that Sweden has only some 5,250,000 inhabitants and Finland a bare 3,000,000, the doings of their athletic representatives at Stockholm seem little short of marvelous, all the more so when it is borne in mind that their active participation in international athletics is practically only a decade old! Well may they swell with pride as they look on the great record of their prowess, as thus finally tabulated:

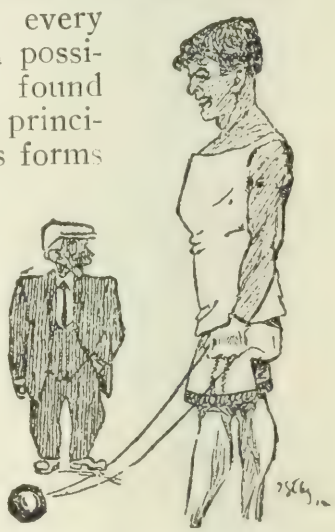
	Firsts.	Seconds.	Thirds.	Points.
1. Sweden	23	24	16	133
2. United States....	25	17	20	129
3. Great Britain ...	10	15	16	76
4. Finland	9	8	9	52
5. Germany	5	13	6	47
6. France	7	4	3	32

In looking over the field of athletic accomplishment, one is struck by the fact of the general all-around excellence of the Swedes, there being no department of endeavor in which they did not have some one who made a creditable showing, whether on the track, in the field, on horseback, on the mat, with pistol or gun, in the water or on it! And nothing gave more eloquent proof of this splendid general development of theirs than the magnificent showing the nation made in the modern Pentathlon, when Lieutenants Lilliehöök, Asbrink and De Laval took first, second and third places, and the fourth, sixth and seventh likewise fell to Sweden, the fifth going to an American officer, Lieutenant Patton! The modern Pentathlon, be it pointed out, calls for even more versatility than the ordinary Pentathlon, as it consists of a 100-meter foot race, pistol shooting, swimming, fencing and steeplechase!

Wiklander, Finnish discus-thrower

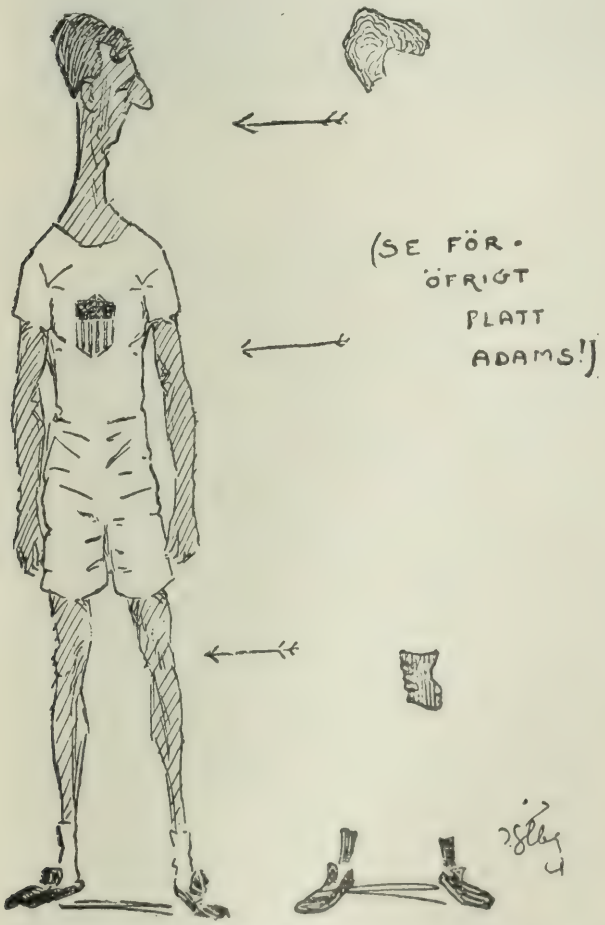
It must be borne in mind, of course, that the Swedes had the inestimable benefit of the expert services of their trainer, Ernie Hjertberg, a man of Swedish birth who had learned the fine points of his profession in America, and who had spent two years in Sweden traveling the country in search of good athletic material and then molding it into shape, but what made it possible for him to accomplish such splendid results was the fact that he had a magnificent foundation on which to build; a foundation of which the Finlanders, who had no professional training whatsoever, gave an even more impressive exemplification, and to which I shall refer in more detail a little further on.

But first let us cast a glance on the performances of the representatives of the grand duchy. We find that they excelled more particularly in three branches—weight and javelin throwing, long distance running and wrestling. In these departments they had the great distinction of securing several world's records, the marvelous runner, Hannes Kolehmainen, getting two of them in the 5,000-meter and the 10,000-meter races, Taipale one in the discus, best hand, and Saaristo another in the javelin throw, right hand. In wrestling the Finns carried off the lion's share of the honors, gaining points in every single one of the various weights, and totaling no fewer than 14 in this, the most arduous of all the Olympic sports.



Ernie Hjertberg, Swedish trainer

And thus we come back to the foundation of which I made mention a short while ago. This is to be found in the national policy, which has long recognized in *mens sana in corpore sano* the surest foundation for true prosperity and progress; a policy made truly national thru the foresight and energetic pertinacity of a Swedish medico-gymnastic practitioner named Per Hendrik Ling, who, no longer than a century ago, secured the co-operation of his Government in the establishment of a national gymnastic training which had for its deliberate object the symmetrical development of all the bodily organs, and thru that the attainment of perfect physical well-being.



Here, then, is a lesson for us Americans, who attain our results thru a system of intense specialization, with the consequence that for each well-trained athlete we have an untold number of individuals more or less flabby in tone and slouchy in mien and gait. If anything imprest visitors to the Olympic in London four years ago more than anything else it was the magnificent spectacle presented by the four Scandinavian countries of Sweden, Norway, Finland and Denmark, in their gymnastic evolutions performed by bodies of sixty or seventy men, and others, only less numerous, composed of women, all going thru the most intricate movements with a grace and rhythmical precision of action that was most beautiful and actually imposing to witness. And at Stockholm this impressive spectacle appears to have been repeated.

Here, then, in nations addicted to outdoor pursuits, and living a frugal and simple life, mostly in rural communities, we have a splendid stock on which to build athletic supremacy. And the Swedes and Finns are born sportsmen. Wide awake now to their advantages, they are bending to the task with genuine enthusiasm, in the true amateur spirit. In these high northern latitudes, where life is a matter of frequent struggle against climatic conditions, it is natural that the inhabitants should seek every means of relaxation possible, and they have found this their salvation principally in their various forms of outdoor sports. As a matter of fact, no nation has ever been more imbued with a love of sport for its own sake than the Swedes, and that from time immemorial almost, as is evidenced from the

Keith, hammer-thrower, and his trainer

fact that it was not necessary to take the English word "sport," as other nations have had to do, in order to express the idea of participation in outdoor amusements, because the language already had in the word *idrott,* descended from olden days, exactly the term needed. From the days of the Vikings, so known to the rest of the world for their physical prowess and manly beauty, it had been the custom of the Northern races to cultivate bodily strength and suppleness with endurance and courage, as well as mental alertness and a certain culture, thru the exercise of poetic utterance and the arts of debate. Even then the Scandinavians were

The American athletes, Ben Adams and Platt Adams, look so much alike that the economical Stockholm cartoonist only sketches the distinctive features of Ben Adams in the matter of hair, legband and shoes, and then adds: "For the rest see Platt Adams!"

taught to excel in running, racing, leaping, swimming, wrestling and fencing, besides the feats of horsemanship and skill in archery and spear-throwing more particularly required of the ruling classes. They also had various games in which a ball was used, the principal one of which, among those which have survived to the present day, is the game of "park," as played in the Island of Gotland, and the only sport which can perhaps be said in any degree to rival the Anglo-Saxon cricket and baseball.

Ralph Rose—r sting

It is, of course, particularly in their winter sports that the Swedes and Finns excel, and of these none are more essentially national than ski-running and skate-sailing, associations for which exist in great numbers thruout Scandinavia. Skate-sailing is something that we here in America know comparatively little about, but it has grown to enormous proportions as a national pastime in Finland, as well as Sweden and Norway, and it is no longer an uncommon sight to see youths scudding along before the wind at the rate of fifty miles an hour on the smooth ice of the fjords and lakes.

Of skating, sleighing and tobogganing it is scarcely necessary to speak, inasmuch as the skill of the northern nations in these forms of winter sports is as well established as that of our own Canadian neighbors in this hemisphere. In both speed and figure skating Norwegians, Swedes and Finns have repeatedly carried off international honors. Ice-yachting has suffered to some extent by the enormous popularity of skate-sailing, which is equally invigorating and far less expensive, and also from the circumstance that it is only rarely that an extended frost is unaccompanied by snow, which spoils the surface for the purpose of ice-yachting. As for toboggans, they can be reckoned by the thousand in the neighbor-

MacDonald and a mere sightseer

FINLANDERS PRACTISING GYMNASTICS IN THE GROUNDS OF NYSLITE CASTLE

hood of the cities on both sides of the Baltic, all the more so since it is a form of sport not only of very early origin among the Scandinavian peoples, but greatly in favor with people in society. Stockholm and Helsingfors, for instance, have splendid toboggan hills, where nearly the whole school population may be seen on any winter afternoon making life one long round of delight.

As for the summer sports, sailing and swimming rank first, clubs and associations for their furtherance existing everywhere. The Royal Swedish Yachting Club, with headquarters in Stockholm, is probably the largest of its kind in the world, both in members and the number of boats owned. The Nyland Yacht Club, of Helsingfors, in Finland, is also a large and very important organization. The racing weeks of the Stockholm and of the Nyland yachting clubs are national festivals. In swimming these northern nations are *facile princeps,* and the Swedish swimmers especially have again and again carried off the principal prizes at the Olympic games and other international meets. But perhaps it is in trotting that Finland stands out above her competitors of the North. The Finnish pony is noted for his qualities of endurance, and of late the trainers of that country are getting it to show more and more speed.

As a further explanation of the noteworthy hardiness and endurance of the Finns in particular, which accounts in large measure for their achievements in distance running and with the weights, there must come into consideration the national habit of constant bathing, no Finnish peasant being too poor to have his special bath-house built out from the dwelling house, and to which he resorts two or three times a week, and in the haying and plowing seasons once and sometimes twice a day, and in which he also takes steam baths and hardens his skin and muscles by massage and whipping with birch twigs.

In view of all these circumstances, then, is there any longer any reason to doubt that the Finns and the Swedes must continue to improve in the domain of athletics, and that the time will come when, as Mike Murphy was led to observe at Stockholm after a study of the representatives of these nations, neither Americans nor Englishmen will be "in it"? And can we not then take a leaf out of the Scandinavian book even now, and begin to pay more attention to general all-round development and less to extreme "specialization"?

New York City.

Literature

The Strangling of Persia

Mr. W. Morgan Shuster gives in his book of the above title* an extraordinarily interesting and valuable narrative and record of the author's experiences and observations during the period in 1911 that he undertook to administer the finances of Persia. It is written in a fresh, vigorous style, and contains many excellent photographs and a surprising amount of information concerning not only his work and the controversies in which he was engaged, but also the manners, customs, habits and recent history of the Persian people. The title of his book is one that might have been very properly selected at any time during the last two thousand years by any one familiar with Persian finances, and will serve as an inspiration to all future writers who desire to portray actual conditions in Persia so long as Persia remains even a geographical expression. Strangling is a process that has always been in operation in weak countries, owing either to the rapacity of their own native governing class or to the various motives that induce stronger nations to seek to control them. During the period that Mr. Shuster was in Persia the special strangling that occupied his attention was done by Russia, with the help, active or passive, of Great Britain. He had hoped when he went there that those two Powers would relax their hold sufficiently to let him perform his duties; but they tightened it, as they believed that he was intent on strengthening their victim and on weakening them. There was nothing for him to do, therefore, but to attempt to proceed with his work in spite of their opposition. He made a brave and brilliant start, and was supported for a time very sympathetically by the Persian national parliament, or Medjlis, as well as by public opinion, not only in Persia, but thruout the world; but his very success was the cause of his downfall. Russia could not afford to have him teach the Persians that they could collect their taxes and customs duties expeditiously and honestly, pay off their foreign loans, meet all running expenses of the Government and have a surplus with which to increase the strength of their army, build fortifications, construct roads, support schools and hospitals, and, in short, give Persia an honorable place in the family of nations. An independent Persia was exactly what Russia did not want, and had not wanted for scores of years. She had patiently acquired a valuable sphere of influence and control in Northern Persia, just as Great Britain had in Southeastern Persia, and rather than permit Mr. Shuster's plans to succeed, she would undoubtedly have seized Northern Persia and added it permanently to her domains.

Such a step as that on Russia's part would have compelled Great Britain to seize the lower portion of Persia. As neither Russia nor Great Britain desired at that time to divide Persia, and as Great Britain evidently feared that if she opposed Russia's policy in Persia Russia would retaliate by lending elsewhere greater diplomatic support to Germany than Great Britain could afford to see given to an opponent, the British Ministry very naturally concluded that they ought to subordinate the interests of Persia to those of the British Empire. Russia was, therefore, given a free hand to take such measures as were necessary to compel the Government of Persia to be tractable and to dismiss Mr. Shuster, who, diplomatically speaking, had to be regarded by Russia and Great Britain as a disturbing element in Persia, and who, they undoubtedly believed, and not without reason, would, by creating visionary ideals and by adding to the surplus in the Persian treasury, increase the discontent of the lower classes and augment the greed of the official classes. Mr.

*The Strangling of Persia: Story of the European diplomacy and Oriental intrigue that resulted in the denationalization of twelve million Mohammedans: A personal narrative *by W. Morgan Shuster*, ex Treasurer-General of Persia. New York: The Century Co. $2.50.

Shuster himself seems to have been greatly imprest with the liberties taken with public funds by public officials whenever they could get control of them, and he must have realized before his departure from Persia that if he could have completed the full term of three years for which he was engaged to serve as Treasurer-General he could not have succeeded in educating the governing class so that they would have continued his work honestly and efficiently. He should be satisfied, however, taking everything into consideration, with having proved conclusively to Persia and to the rest of the world that splendid results can be achieved by good management even in a moribund nation, and that it would be a much more creditable task for the strong nations to build up weak nations than it is to strangle them.

HERBERT W. BOWEN.

New Books on the Civil War

IT is not surprising that, half a century after the Civil War, there should continue to be extensive additions to the literature concerning it. The reasons are evident enough. For one thing, the survivors among those who played an active part in the struggle are setting down their recollections. Moreover, the younger generation, feeling little of the bitterness which animated their parents or grandparents, must have a new story of the war and one that attempts to do justice to the men who fought on either side. Something of this impartial spirit appears in two new biographies of Robert E. Lee, one by Gamaliel Bradford, who is a Northerner, and the other by Thomas Nelson Page, who is a Southerner.[1]

Strictly speaking, Mr. Bradford has not given us a biography. Somewhat in the manner of Rothschild's "Lincoln" he has written a sympathetic study of the great soldier's character; a psychography, he calls it. Swinging clear of the formal sequence of chronological detail, he considers only such matters as are spiritually significant and groups them into chapters, each of which deals with a different relationship ("Lee and Davis," "Lee in Battle," "Social and Domestic Life," etc). This scholarly and searching analysis reveals a personality more impressive, more perfect in its simplicity and self-effacement, than any partisan eulogist could have made it appear. The portrait shows a man of heroic proportions who should hold in the heart of his countrymen a place hardly less exalted than Lincoln's. Lee always thought as an American. "Abandon all these local animosities," he said, after the war, "and make your sons Americans." Mr. Bradford lays emphasis upon Lee's great modesty. Out of this, no doubt, came his nice avoidance of duties which did not strictly belong to him. Not only did he distinguish carefully between civil and military matters, but he also drew the sharpest line between his own duties and those of his subordinates. The author says:

> "One reflects that it was probably just this clear sense of what others ought to do and should be left to do that made Lee's power. Smaller men fret over executive details or rush madly into what they do not understand."

Mr. Page, tho his book makes delightful reading, shows less discrimination, a less careful weighing and sifting of evidence than Mr. Bradford. His language is that of the devotee. "History may be searched in vain to find Lee's superior, and only once or twice in its long course will be found his equal. To find his prototype we must go back to ancient times, to the antique heroes who have been handed down to us by Plutarch's matchless portraiture." The author has given a full account of the extraordinary conditions under which Lee held his military command. There is some repetition, for while he gives a history of the military operations which is sufficiently complete to allow the reader to follow the masterly campaigns intelligently, he has given separately an outline of Lee's career for the benefit of those who are not attracted by the description of battles. Perhaps the most interesting part of the book is the chapter which describes the relations between Lee and the civil power. The Confederate Government is subjected to some very pertinent criticism. Certainly Lee, unlike most of the great commanders of the past, found

[1] ROBERT E. LEE: MAN AND SOLDIER. *By Thomas Nelson Page.* With Portraits and Maps. Pp. xviii, 719. New York: Charles Scribner's Sons. $2.50.
LEE THE AMERICAN. *By Gamaliel Bradford, Jr.* With Ten Illustrations. Pp. xiii, 324. Boston: Houghton Mifflin Co. $2.50.

himself hampered thruout. "The chief disaster was the policy of the Government to attempt to hold all the South instead of adopting the military policy, urged by Lee, of concentrating its armies and dealing the adversary a crushing blow." He had "to bow to the inevitable in the form now of political interference, now of personal incompetence." It is matter of common knowledge that, toward the close of the struggle and in view of these complications, people were constantly discussing the advisability of vesting in Lee the powers of a dictator.

General Joseph Wheeler and the Army of Tennessee are the subjects of another volume.[2] Mr. DuBose, whose "Life of Yancey" is favorably known, writes with fairly complete information, having the advantage of a soldier's training and an intimate acquaintance with General Wheeler during the last forty years of his life. In the introduction, unfortunately, some immature and partisan observations have been made regarding the events leading up to the war. We are seriously informed that Lincoln "received 180 votes from the colleges, fourteen of which . . . were in a state of treason, disqualified for the exercise of any civil function." Aspersions are cast upon the birth of Lincoln and the character of his mother in order to explain the assertion that "he possessed a native force of mind and strength of character not traceable to his assumed humble parentage." In the South, we are told, existed the purest democracy that was ever known. Many will be disposed to agree, however, that the slaves would have been lifted into the wage-earning class without the assistance of the sword. The narrative itself is plain and straightforward and not a little illuminating in some matters which are still under controversy.

Among five new volumes of reminiscences, *A Chautauqua Boy of '61 and Afterward*[3] is marked by unusual characteristics. Colonel Parker, entering the war as a private in a New York regiment, was soon promoted and detailed as superintendent of mails and dispatch bearers of the Army of the Potomac, a position which made him practically a staff officer and gave him unexcelled opportunities for observation. After the war he remained in Richmond, first to reorganize the postal service in Virginia and afterward as United States Marshal. In 1876 he became head of the postal secret service. On account of his powers of observation, his retentive mind and the nature of his occupations, the book is a distinct contribution to our knowledge of certain phases of the war and of the reconstruction period. As Professor Hart says in the introduction, few books reveal so clearly the original helplessness of the armies, the lack of any traditional or regular method of caring for the men in the field. The picture of conditions after the war—the decayed farmhouses, the bad roads, the moonshiners, the counterfeiters and other desperate characters—is none the less vivid because it appears incidentally in a quiet recital of facts.

The *Reminiscences of General Basil Duke*[4] also have an engaging quality. Duke was high in the confidence of Morgan and later himself commanded the cavalry which that leader had made famous. He is eminently fair to both sides. He agrees with the opinion which a growing number hold today that the war might have been averted. To the younger generation, he says, it is incomprehensible that a people with so much to hold them together "should have obstinately rejected compromise and insisted on war." Very instructive are the chapters which deal with social and economic conditions, especially the various aspects of slavery. His conclusions on the last point are that the negroes were almost invariably treated with kindness and consideration; that they were well housed, comfortably clothed and bountifully fed; and that, within his observation, they were not overtasked or required to work more than eight or ten hours a day.

With Fire and Sword is an apt title for a volume by Major Byers,[5] author of several other works on phases of the war. He belonged to a regiment which

seemed always to be in the midst of stirring experiences and which actually fought itself out of existence. When Major Byers finally escaped from Libby Prison, after months of confinement and remarkable adventures, he was mustered out as a supernumerary officer; his command had ceased to exist. The substance of the facts related here are taken from the pages of a diary kept during the war. There is no moment of dullness in the narrative. William Allen Butler's reminiscences[6] will be read rather because of the entertainment which they give than because of any historical value. Written without the aid of a diary, most of what we are told regarding public affairs is lacking in novelty. The book is largely occupied with personal or family affairs, European travel and literary discussion; one chapter, for instance, is devoted to the history of Butler's "Nothing to Wear," which is quoted in full. In *The War of the Sixties*[7] have been gathered together the reminiscences of more than a hundred soldiers and sailors of the Union and Confederacy, particular incidents which struck the writers forcibly at the time and left a clear and indelible picture. They are all short, usually two or three pages long. Some will be found trivial and wanting in point, others crude or flamboyant; but on the whole, the effect is excellent, the little but significant incidents bearing upon them the stamp of truth and telling us more graphically than any connected narrative what the war was really like. *The Siege of Charleston,* by Gen. Samuel Jones,[8] is a posthumous work edited by his daughter. It was evidently planned as a systematic and thoro account, but was never brought to completion. No indication is anywhere given of sources of information, altho there is indirect evidence of careful preparation.

The Hon. Hilary A. Herbert has written a vigorous account of the causes of the war from the Southern standpoint.[9] He believes that a widespread early sentiment in the South against slavery would have led finally to some peaceful form of emancipation but for the fanaticism of Northern abolitionists. The book is a graphic treatment of abolitionism, which is here given a more weighty significance than it usually receives. "Every one knew," he says, "that if . . . the anti-slavery hosts had halted and asked for or consented to peace, they could have had it at once."

A useful little book, compiled by Gen. Marcus Wright,[10] gives a list of the general officers of the Confederate army, their rank, dates of appointment and confirmation, and other information. Unfortunately the names appear, not in alphabetical order, but in order of appointment, a serious disadvantage in a work of reference.

Astrology and Religion Among the Greeks and Romans. By Franz Cumont, Ph. D., LL. D. 16mo, pp. xxvii, 208. New York: G. P. Putnam's Sons. $2.

Of the admirable series of "Lectures on the History of Religion," delivered before American institutions by European and American scholars, this by M. Cumont is the latest. This Belgian scholar is the leading authority on Mithraism, and has edited a series of volumes of Greek astrological writers. The present purpose is to show how the worship of the stars, first in Babylonia, and later in Asia Minor, Persia, Syria and Greece, penetrated into Greece, developed into a higher religion than the Olympian, one that had the thought of infinity and eternity, and that connected itself with changeless fate. The rule of the heavenly bodies is discussed, and altho we are not taken into the mazes of medieval astrology, we are reminded of its sway in its effect on language seen in such words as *influence, lunatic, mercurial, martial, jovial* and *saturnine.* Astrology could not have begun to exist as a cult until after a considerable study of the movements of heavenly bodies, and that did not appear in Babylonia until about 600 B. C. Thus the gods became attached in numbers to the heavenly bodies, and Babylonian conceptions were brought over

into Greece, where the science of astronomy was much developed, but never without a religiously astrologic side. This is a very instructive work, and it suggests to us how astrology, like the worships of Mithra and Isis, prepared the way for the easier conquest of Christianity. We may venture to doubt the statement on p. 127 that in old Chaldea sun worship was "esentially a learned cult," one that "grew with science itself, and was definitely established at the period when the latter attained its zenith in antiquity"; that is, not before 500 or 600 B. C. Our author appears to be mistaken in imagining that at so late a period the worship of the sun supplanted that of the moon. From the earliest period the sun had the popular worship under various aspects, while the moon was comparatively little worshipped outside of Ur.

Forgotten Books of the American Nursery. By Rosalie V. Halsey. Boston: Charles E. Goodspeed & Co. $4.

This splendid work will become the basis for all other attempts at estimating the progress of the American story book. Limited in its very sumptuous format to seven hundred copies, it can have but circumscribed sale; yet in a more popular edition it should take its deserved place by the side of Mrs. Field's "The Child and His Book." Little has been written on the American juvenile tale, save a few articles by Mr. Charles Welsh and Miss Caroline Hewins. And now that Miss Halsey has been so conscientious, we cannot but conclude that our children of years gone by very largely read what English children read; that the early history of American juvenile books is the earlier history of English juveniles. Of course, we had the "New England Primer," which was an offshoot of English models; this was indeed native in spirit, and during its period of secularization it reflected some of the spirit of American history, even, so some humorous historian tells us, to the using of a wood cut of George III for Washington—the irony of Fate! But Isaiah Thomas, of Worcester, Mass., stole most of his ideas from John Newbury, of London, and Boston is even robbed of the honor of harboring the original Mother Goose! Altogether, the early American juvenile books were neither original in source nor amusing in content. Strive as Miss Halsey does to treat attractively what must have been heavy diet for the young of the eighteenth and nineteenth centuries, she succeeds merely in showing the religious and moral ponderousness of the small paper-covered booklets, with their makeshift woodcuts. We were English until Cooper. Miss More and Miss Edgeworth ruled child realms until Lydia Maria Child and her contemporaries established miscellanies and compiled garlands. Parson Weems falsified in a popular way the life of Washington in his effort to uphold the morality of Thomas Day. From religious preachment, juvenile literature passed into the depiction of priggish character. Peter Parley and Jacob Abbott were our first "supplementary reader" authors.

The Convictions of a Grandfather. By Robert Grant. New York: Charles Scribner's Sons. $1.25.

To sit on a wall and umpire a game of "convictions" going on across the dividing line has its pleasures, its attractions; also its distractions. Judge Robert Grant tries the game, the players being variously representative of the "isms," as they used to be called—"fads," as they sometimes are; "views," "opinions," "convictions," "definitive conclusions" of today, which stand an even chance of becoming the empty shards of definitive conclusions tomorrow. Generally he umpires the game well, but evidently loves the sport, and conscientiously jumps into the mêlée when one side or the other is pushed too hard. Occasionally, when the players have evidently moved away to some far contested corner of the field, he sits alone on the wall, and has a little game all to himself. Then the judicial citations from the book of the game are murmured aloud for the benefit of an imaginary company of onlookers. This serious play occurs chiefly when the game reaches the purlieus of courtrooms and touches on the vampires who linger about the bench of justice and disgrace the proceedings of the bar, or when it suggests those old Roman days when parasites frequented the bed-

sides of old men whose harvest had been unusually ample and whose clutch had grown feeble. Cousins in remote degree they are today, and he finds the courts all too lenient toward them. Corporate charities, workmen's compensation laws, the expansive income tax—these fall into the game. When the contestants return—they are mostly in the family, daughters, daughters-in-law, grandsons and sons-in-law, all with a remarkable family resemblance, in that they all inherit the grandfather's philosophical mood and manner of discussion and his literary habitude—everything in the feminine world of the day becomes "justiciable," and the feminine mood has continually to be reminded that the recall, initiative and frequent referendum are not yet the order of the masculine procedure. The climax of the game is a movable one, but it always threatens to become stationary about the question whether the "modern woman is as intrinsically unselfish and lovable as her predecessor."

The Man in Lonely Land. By Kate Langley Bosher. New York: Harper & Brothers. $1.

This rather trivial book is a disappointment from the author of "Mary Cary." The man in Lonely Land does not seem to be more cut off from the society of his fellows than forty years, a predilection for writing pessimistic magazine articles, and a conviction that he is marked for prey by every husband-hunting female can conspire to make him, which is to say, the Lonely Land is too obviously a region well within reach of succor to inspire the reader with any deep solicitude for his plight. The succor arrives in the shape of a young woman from Virginia, a supposed "country cousin" of his brother-in-law, who comes for a pre-Christmas visit with her New York relatives, and proves to be anything but "country." She is, however, that pure-and-unspotted-from-the-world embodiment of "hospitality" and "graciousness" by which pattern alone the Southern heroine is ever made. The book's style is bright and readable, altho the characters "go *in* the park," and "do *like* he did" (it is uncertain whether this is an attempt at realistic reproduction of the English spoken in certain sections of our country, or an unconscious revelation of the author's own), but there is so little of either originality or substance in the book that one can hardly see its reason for existence.

Literary Notes

....Any one desirous of full information on the private life of the Empress Catherine—which, after all, was pretty public—will find it in *The Comedy of Catherine the Great* (Putnam; $3.75), written by Francis Gribble, a specialist in the romances of the great.

....In a small volume on *Faith and the New Testament* (imported by Scribners) Rev. A. W. F. Blunt, M. A., gives a succinct and sympathetic account of the main conclusions of modern scholars in regard to the origin of the New Testament writings, and frankly considers some of the problems of Christian faith that arise therefrom. The discussions are marked by candor and ample knowledge.

....Dr. Bayard Holmes, M. D., of Chicago, has published a poorly printed volume of essays on medical topics: *The Friends of the Insane, The Soul of Medical Education, and Other Essays.* The essays, many of which are of considerable interest even to the lay reader, are reprints from the *Lancet-Clinic* of Cincinnati.

....A writer of financial advertising, whose stock of ideas is running low, will find an inexhaustible supply in *Two Thousand Points for Financial Advertising,* by T. D. MacGregor (Banker's Publishing Co., N. Y.; $1.50). The book is divided into five sections with suggestions for savings bank, commercial bank, trust company, safe deposit and investment advertising. In addition to the suggestions, there are many comments that will be found valuable by those whose work lies in the financial field.

....Our readers are well acquainted with the dainty stories of Chinese life written by Sui Sin Far (Miss Edith Eaton) and will be glad to know that those published in THE INDEPENDENT as well as in other periodicals have been brought together in a volume entitled *Mrs. Spring Fragrance* (McClurg; $1.40). The conflict between occidental and oriental ideals and the hardships of the American immigration laws furnish the theme for most of the tales and the reader is not only interested but has his mind widened by becoming acquainted with novel points of view.

The Independent

Entered at New York Post Office as Second Class Matter
Publisher, Clarence W. Bowen
130 Fulton Street - - - - New York

A WEEKLY MAGAZINE FOUNDED IN 1848
One Year, $3.00 Single Copies, 10 Cents

Single copies over six months old, 25 cents. Postage to any foreign country in the Universal Postal Union, $1.75 a year extra; to Canada, $1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as those offered by any responsible agency.

An order for the change of an address should be received two weeks before the change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of the publisher's price any book reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with $1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. Even so, we cannot hold ourselves responsible for their return. Authors should preserve copies of their manuscripts.

Advertising rates will be furnished on application.

The New Progressive Party

THE new party is a serious proposition. It is not to be sneered at as of no consequence, mere noise and bluster of dissatisfied ambition, and it will not be snuffed out by abuse any more than by contempt. It has its future, for this campaign, at least, and it sounds a serious lesson to both of the old parties. For its leaders and supporters believe that the old parties are playing politics instead of caring for the people, and they number a great many people. They are very serious. They sing hymns and offer prayers in their convention. There is a religious fervor about them which we like, and their platform is a document such as we have hardly seen. It does not talk Roosevelt, but it gathers in every good aim of government such as everybody believes in, and some not so good; and it strikes the whole gamut of public wants, and promises to accomplish everything that anybody desires. Thus it does not present a single great commanding issue, but rather offers the whole bright lexicon of youth for immediate acceptance and adoption in legislation. Its base of unity is that of all parties, quoted after the familiar manner in the first sentences of the platform, Jefferson and Lincoln's of, by and for the people, the familiar slogan; and then everything gathered in that may be thought of as for the people, to be enacted by the Progressive party.

To be sure the real issue is a personal one, Roosevelt. His was the only name to conjure by. He was the only aspirant for the nomination. It was his convention; it is his party. He dominated in all that was done in Chicago, and a wonderfully able and shrewd politician he is. It is a great achievement to have thus created a national party in a month, and one that threatens both the others. He claims that the Republican party is already dead, and that it is only with the Democratic party that the contest will lie in November. We do not believe it, but the colossal assurance which claims it is worthy of political admiration.

The platform is a very shrewd and able document in the appeal it makes to so many in the vast catalog of its promised reforms. Who would not be glad to see many of them accomplished? And here is a party which tells us that the Republican party and the Democratic are alike the slaves of the favored interests, while it will give itself wholly to this new crusade. But the party must be judged by the question whether it can and will do the things it promises better than the old parties; and also by the character of its reforms, whether they be desirable or not.

And first, and perhaps most important, is the promise to get out of the way the old and apparently effete Constitution of the United States, and the constitutions of the several States. It "pledges itself to provide a more easy and expeditious method of amending the Federal Constitution." Now an easy and expeditious method of amending the Constitution is precisely what we do not want. The very purpose of a constitution is to prevent radical changes of legislation without deliberate consideration. We might as well have no Constitution as one that can be changed at a day's or a year's notice. What is the matter with the present way of amending the Constitution? Under it we are now providing

an amendment that will allow the imposition of an income tax, and only two or three more approvals by State legislatures are needed for its adoption. Of course it must take four or five years to pass an amendment, but that is not too long a time for careful thought. Under this new proposal fiat money might have been put into the Constitution in a year, or, in the Knownothing days, immigrants or Catholics might have been excluded from office. The platform in one specification indicates how it would circumvent the constitution of a State. In case the highest appellate court of a State declares an act passed under the police power of a State unconstitutional, meaning such matters as labor of women or children, it is pledged that the people shall have the opportunity to vote whether the act shall become law notwithstanding the State constitution. That is simply subverting the constitution. It is better to amend the constitution in the regular way. It is bad enough to play fast and loose with laws; constitutions should be held sacred and they can be amended when there is need.

If we can judge from the platform the appeal of the Progressive party will be largely to wage laborers enrolled in unions, rather than to farm hands, clerks, etc. Hence no injunctions in labor disputes, trial by jury in cases of contempt connected with labor troubles, safety standards for various occupations, minimum wage standards for working women, the eight hour day and no night labor for women and children, the abolition of the convict contract labor system and confining convict labor to Government work, publicity in all labor contracts or conditions, and, finally, a Department of Labor in the Cabinet. These propositions, with others, are mainly good and appeal to all parties.

In the matter of big corporations the new party is fairly conservative. It believes in consolidation, but wants it under Federal control, as does everybody else. It would have a strong commission to control corporations and prevent the familiar abuses, something like the Interstate Commerce Commission. This is not new, and it does not need a new party to secure it. The attitude toward corporate wealth appears in the statement that "the test of corporate efficiency shall be the ability better to serve the public," which is an old-fashioned truth.

The platform definitely condemns the Aldrich bill for the improvement of the currency, but it suggests nothing better. It wants more foreign commerce and hints at subsidies when it "demands adequate appropriations by Congress," but it does not suggest the only way by revoking the law which forbids foreign-built ships to carry the American flag; but the Senate has just approved a bill to that effect for ships engaged solely in foreign trade, and has thus taken action more progressive than the Progressives.

Much space is given to conservation of forests, oil lands, water rights, levees on the Mississippi, Alaska coal, etc., in which nothing new is said beyond what all approve. The recommendation for extensive and expensive improvement of rivers, "opening them to traffic," opens the way to great waste. Rivers are no longer and never can be again "a great national system of transportation." They cannot compete with railways; the history of the Mississippi packets is proof. It is the current jealousy of railroads that accounts for urging the very questionable and very costly plan for a "Lakes-to-the-Gulf deep waterway." We cannot approve the plank of the platform which would refuse to allow vessels owned by a railway company to sail thru the Panama Canal; nor the further provision that American vessels engaged in coastwise traffic shall pay no toll.

On tariff and taxation, very important subjects, there is nothing progressive. A protective tariff is favored, with certain reductions of the present tariff as they may be recommended by a nonpartisan tariff commission. That is the Republican measure to a dot. The platform would "equalize conditions of competition between the United States and foreign countries, both for the farmer and the manufacturer"; and yet it says that "the presumption is always in favor of the consuming public." But the consuming public wants free trade and low prices, while it is the manufacturer that wants protection. When the platform "demands the immediate repeal of the Canadian reciprocity act," it demands it

in the interest of a protective tariff, and it is less progressive than is President Taft.

Once more, there is nothing progressive in the action on international peace and arbitration, which are favored, but the party demands two battleships a year meanwhile. Again we cannot assent. But we do most heartily approve the demand for female suffrage, which is truly a progressive feature, as well as the interest shown in the labor conditions of women and children. It was these features which evoked heartiest praise by Miss Addams in her admirable short address, seconding the nomination of Mr. Roosevelt.

We have not specified all the pledges made, only the most important. The rest reach from initiative and parcels post to protection against worthless investments and the turning the tide of immigration from the city to the country, which cannot be done. The native-born, as the immigrant, are equally drawn to the city by a law of civilization.

We have spoken of the platform as a marvel of inclusiveness. But there are strange omissions. Immigration laws are absolutely ignored. We have very unjust exactments against Chinese immigrants, but there is not a word on the subject. It would not do to say anything generous or progressive on that subject, with Governor Johnson, of California, as candidate for vice-president. And again, while the platform pledges the party to seek State as well as Federal legislation in the reform of abuses and the righting of wrongs, and while it sweeps the horizon for minor as well as major wrongs to be righted, the one greatest injustice of all is absolutely ignored. It was said of Senator Edmunds, of Vermont, when he first entered Congress as a young man, by one of his colleagues, that he could see a fly a mile off on a barn door, and not see the door. Such is the blindness of the Progressive party to the most monstrous of all injustices in this country, all that is flagrant and obtrusive, that wrong which, as Mr. Roosevelt told the convention, has excluded the negro from the ballot in a number of States, and has put on him the brand of inferiority by various devices of legislation. The Republican platform is no better, but here was the Progressive party hunting evils, sifting them out, and it could not see the greatest. It wouldn't, because that would not do. It would cause a coldness in the meeting which was inviting white Southern delegates and excluding colored ones.

Yet, with exceptions noted, it is a good platform. We have a multitude of subscribers who will vote the Progressive ticket. We have no word of rebuke for them. For us we hold that the Republican party will do more in the way of reform than the Progressive party can. We know that President Taft has done more for progressive measures, by breaking up monopoly, than did Mr. Roosevelt. We believe him a truer peace man. We can better trust his safe judgment in all foreign matters, and these are of prime importance. Had Roosevelt been President these two last years who can be sure we should not have had war with Mexico and intervention in Cuba? With Taft in the Presidential chair we have maintained peace with honor. Yet it is to the credit of the American people that Roosevelt's passionate advocacy of primary ethical principles, of justice and fair play and the square deal has given him so enthusiastic a following.

No Square Deal

A BULL is an unwelcome apparition in a china shop, and the Progressive party convention gave no kindlier welcome to the negro question. It had to appear, and it had to be driven out for fear it would smash things. The Democratic convention has no such question; it is ruled by the solid South, and the solid South gives no political rights to the negro. The Progressive party is a break from the Republican party, and the Republican party has in its conventions given fair place to the negro wherever he is in the majority of the party's members, as in the South. But Mr. Roosevelt wished to break up the solid South by organizing his new party in the Southern States, and he gave it to be understood that no negroes from those States should be admitted to his convention—negroes only from the North; and

to show his kindliness to the black people he took special pains to have negro delegates from certain Northern States. But from Mississippi negro delegates came and sought almission on the ground that the opposing delegates had been selected under a call to white voters only. On the advice of Mr. Roosevelt the negro delegates were excluded and the white delegates admitted, but with the declaration that the call excluding negroes was not to be approved.

For that much, thanks. It is admitted that thus to exclude a class is wrong, but they are to be excluded just the same, for the sake of success. Mr. Roosevelt knows the temper of the South toward negro suffrage and he bows to it, and takes advantage of it. The Republican party knows it, but it does not bow to it. It asks negro votes and admits negro delegates from the States that suppress their votes. In principle it is right, even if the political use of the negro delegations has not always been creditable. Mr. Roosevelt tells of the superior quality of his negro delegates from Rhode Island and West Virginia, and says that when such men can be sent from the Gulf States they will be admitted by the willing assent of white men. He knows better. The negro delegates at the Republican convention were as worthy as those of his whom he praises. He knows how they resisted temptations offered by white men, and not one proved false to the trust imposed upon him. There are such educated, respectable negroes in the South by the ten thousand, as worthy as their white fellow citizens, and it is such men from Mississippi whom the Progressives rejected.

Mr. Roosevelt, master of misleading logic and rhetoric that he is, gives the reason for excluding negro delegates from the South while seeking them from the North. He says that in those Southern States "that never cast a Republican electoral vote, that never elected a colored man to office, largely owing to the action participated in by the Republican party, the colored man has, as a matter of fact, gradually lost all his political rights." So he has, but how is this largely owing to the Republican party? Such is not the fact at all. Thirty-five years ago the National Government gave up the attempt to control racial political conditions in the South, and the States, or the white people of the States, have ever since then been solely responsible for the legislation under which the colored man "has lost all his political rights." The Republicans in those States were negroes; they certainly are not "largely responsible" for the Jim Crow laws and "grandfather" clauses. All the Republican administrations have done is to appoint a negro occasionally to office where he was not wanted by white Democrats, and the party has maintained the rights of colored Republicans to sit in the national conventions. It is absolutely untrue that the North has tried to "dragoon the white men" to send negro delegates, or that the attempt "to force conditions that we cannot make to exist there has failed." There has no such force been used.

Mr. Roosevelt concludes:

> "We are setting a standard to which we can have a reasonable hope that our brethren of the South will themselves come up when we no longer attempt to drive them, when it is a matter of honorable obligation with them as with us."

"To drive them!" Who has attempted to "drive them"? And who are these "brethren of the South"? This was a Mississippi delegation that was excluded, and the majority of "our brethren" of Mississippi are colored brethren. It was their "honorable obligation" to take a part in politics; who forbids? Theodore Roosevelt, simply because the white people object, and like too many others, when he speaks of the Southern people, he ignores or even excludes nearly half of them, and he complains that to accept a black man is to use "force," is to "drive" the South, and so the black man must keep quiet and submit; for he says:

> "I hold that the white man and the colored man who endeavor to make the colored man discontented with what we are doing are the worst foes of the colored man."

So we do not hold. We hold that discontent is the only condition of improvement and hope. We should be ashamed of humanity if the colored man were not discontented, if he were contented to have "lost all his political rights," and among them the right to take part in the organization of a party whose main asset

is that it is greatly discontented with conditions as they now are.

Mr. Roosevelt asserts that the Republican party has attempted to "drive," "control" and "dragoon" the South. A correspondent well known as an able financier and equally as a philanthropist makes the contrary criticism of the party and of THE INDEPENDENT'S statement in our issue of July 11 as to "Our Position in This Campaign." He says:

> While I fully agree with the point which is made the chief basis of your position, namely, that the Democratic party is in the South false to the doctrine of the equal rights of men, and because of that I do not expect a satisfactory outcome from the Democratic party, yet there is, I think, no possible basis for a preference of the Republican party on that issue. It has been for many years quite possible for the Republican party to have corrected this injustice by a measure which would have produced a natural evolution of political action in the Southern States; namely, the passage of one of the bills often proposed, to so base the representation in Congress as that the votes cast should be the decisive factor. It was pure and disgusting cowardice on the part of the Republican party, accompanied by the shrewd consciousness of the dominant business interests that they would be safer by having a party of privilege in the North and West based on the highway robbery of the protective tariff and its brood of "protection" grafts of every description in every electoral district; and by having another party of privilege in the South based on the monopoly of voting (for the whites only) which practically has become a monopoly of a selected portion of the whites.

That the Republican party has, since President Grant's administration, failed to take much interest in the negro question, leaving it to the States to deal with as they could, we stated in that editorial; but at least it has not been guilty of positive injustice to our colored citizens. But it would have been compounding injustice if it had done what our honored friend approves. Those bills were bills of pure politics, not offered to better the black man, but to strengthen the Republican party by reducing the Democratic representation from the South. We opposed those bills for the same reason that all leading negroes opposed them, because it would be giving consent to the suppression of the negro vote. Were such a bill to become law the negro who wanted to vote would be told that Congress had given representation at Washington only to white men, and it would have put off the day when the negro shall have his political rights. We stand on the fourteenth and fifteenth amendments, and Congress has no right to be a party in any way, direct or indirect, to nullifying them. So long as we give the Southern States representation in Congress on the basis of their colored population we declare that there should be a square deal for both white and black at the ballot box; and we condemn Mr. Roosevelt and his convention for refusing the square deal for whites and blacks alike in those States in which the white citizens shut out the colored citizens from the ballot.

Governor Wilson's Speech

CRITICS are saying that Governor Wilson's speech of acceptance is not sufficiently specific. This is asserted by some who are not moved by partisan hostility. It seems to us that they do not take into account his conception of what such a speech ought to be. He decided, we think, that he ought to set forth principles rather than the details of processes by which these principles should be applied in legislation. He sought to show what the problems are, but not to mark out exactly the method to be pursued in solving them. But he leaves no room for doubt concerning his attitude toward the problems or his conviction that a solution should be undertaken in the interest of justice. At the same time he discusses the problems without passion or personalities, declines to be dogmatic as to questions about which he has not expert knowledge, and is temperate in stating the policy which his party should uphold in dealing with questions affecting the business of the country.

For example, while holding that the only safe and legitimate object of tariff duties is to raise revenue, and asserting that there should be immediate revision, "unhesitatingly and steadily downward," he does not ignore the fact that "business is exceedingly sensitive to changes" in tariff legislation, and that "its foundations must not be too radically or too suddenly disturbed." Therefore, he says, "we should act with caution and prudence, like men who know what they

are about, and not like those in love with a theory," and the changes "should be made only at such a rate and in such a way as will least interfere with the normal and healthful course of commerce and manufactures." A great part of the speech relates to the tariff, and no one can justly say that he is not specific in his disapproval of the methods and purposes of a considerable part of tariff legislation in the past, but it is clear that he would have revision proceed with due regard for the manufacturing and labor interests involved.

Again, speaking of the Trust problem, while pointing out the effect of tariff duties in promoting the formation of combinations, and the exaction of high prices by means of monopolistic control, he says he does not think the old competition can be restored by law, or that "business done on a great scale by a single corporation is necessarily dangerous" to the economic or other liberties of our people. "Big business is not dangerous because it is big, but because its bigness is an unwholesome inflation created by privileges and exemptions which it ought not to enjoy." Competition, he says, should be encouraged by laws forbidding unjust practices by which it has been suppress, and the Sherman act should be supplemented by laws designed to effectually prevent those practices. These are not radical and revolutionary views. He speaks of vast confederacies of banking, railway and manufacturing interests. These, he thinks, are not illegal, and they are a natural growth. But he would have laws to prevent such concentration from becoming dangerous to free enterprise, "if laws can be worked out that will accomplish that result without destroying or seriously embarrassing any sound or legitimate business undertaking, or necessary and wholesome arrangement." Here we see the caution due to some knowledge of the interests involved and of the character of the concentration, rather than the unqualified denunciation and bitter assaults of those in his party who demanded the "Money Trust" investigation.

We have referred to these remarks partly because they fairly indicate the tone and drift of the entire speech. It is one which the average intelligent Democratic partisan can support, while to business interests it promises a reasonable conservatism. We should add that at the beginning the progressive spirit of the time is clearly recognized in what is said about a nation awakened to the effect of privilege and private advantage and to the knowledge that certain cherished liberties have been lost. But in those passages there is a suggestion of moderation when the Governor says: "The tonic of such a time is very exhilarating. It requires self-restraint not to attempt too much, and yet it would be cowardly to attempt too little."

A Surreptitious Subsidy

As we pointed out in our issue of July 25 the introduction into the Panama Canal bill of amendments granting free passage to American ships is really the same thing as taking so much money out of the national treasury and giving it to the steamship companies. But the proposal to subsidize American shipping, tho often and eloquently urged, has never met with the approval of the people, and the Senators have no right to introduce it in disguise. What is still worse, they have introduced it in such a way as plainly to violate our treaty with England. We admit that many arguments can be advanced in favor of stimulating our shipping by subsidies as other nations do, and tho we do not think that policy advisable, we believe that a general ship subsidy or even one confined to coastwise vessels would not contravene the Hay-Pauncefote treaty as does the bill passed by the Senate on August 9 by a vote of 45 to 15. The Senators who advocated it admitted that if the matter were brought before The Hague Court it would inevitably be decided against us and we should then have to pay back the tolls collected from foreign vessels in the meantime, say ten years or so. That is, whether the action taken by the Senate be right or wrong, it is what all the other nations of the world would call wrong. But Senator Cummins says that we will never consent to submit the question to such a tribunal; that there is but one tribunal to settle such a question, the arbitrament of

war. In saying this Senator Cummins is advocating the violation not only of the Hay-Pauncefote treaty, but, what is worse, of all our arbitration treaties, for if an agreement to arbitrate does not include the interpretation of a contract with another nation to what cases can it possibly apply?

There is indeed the best of reasons for believing that all the Powers would think us wrong if after agreeing that "the canal shall be free and open to the vessels of commerce and of war of all nations . . . on terms of entire equality . . . in respect to the conditions and charges of traffic," we should make an exception in our own favor. That was the view which the United States took when the shoe pinched the other foot. In 1846, when this neck of timber belonged to New Granada, we made a treaty with that country which provided that the citizens of the United States should enjoy all the exemptions, privileges and immunities concerning commercial navigation enjoyed by the citizens of New Granada and "that no other tolls or charges shall be levied or collected upon citizens of the United States . . . *than is under like circumstances collected from Granadian citizens.*" That is what we thought a square deal in the days before we "took" Panama. Does any one doubt that if the canal had been constructed fifty years ago under this treaty we would now make a very great outcry if the government at Bogota determined to remit the tolls of its own vessels?

Let us at least wait till we get the money from the tolls before we decide that we shall make a free gift of it to the steamship companies, instead of using it as we designed to use it, to pay the interest on the money we borrowed to build the canal.

In this issue of THE INDEPENDENT we print an article on Panama charges which shows what must be done if we are to get back any of the $400,000,000 that we have invested in the enterprise. Those who wish to study the question more thoroly should procure Mr. Johnson's "Preliminary Statement on Panama Traffic and Tolls," which is published as Senate Document 575, and contains maps and tables showing what effect the canal is likely to have upon the commerce of the world. If the canal is to be anything but an expense to us we must get as many foreign vessels to use it as possible, and the way to do that is not to manifest at the start a disposition to take advantage of them by what they consider—and we think rightly—a violation of our agreement to give them equal privileges. Already we see the effect of it in the report that Great Britain and her colonies and Russia and Japan are likely to refuse to take part in the Panama Pacific Exposition of 1915. If these, and perhaps the Western States of South America, are not represented at San Francisco, what sort of a Pacific Exposition will it be?

City Poets

SOME time ago there appeared in the London *Times* an editorial asserting that Wordsworth was the only poet who ever "preferred and lived, of free choice, the simple country life." An American newspaper editor embroidered this gloss upon the text:

> "Poets in general have chosen nature as a priestess, but not as a companion. . . . They are constantly giving voice to the love of the country, but it is the townsman's love, not the countryman's. And it is the townsman who longs to find expression for his feeling."

Nowadays the poor countryside may consider itself lucky if it gets into verse at all, whatever its author's place of residence. The city versifier no longer betakes himself to green fields and pastures, hat in hand and pad in pocket. Quite unabashed, he acts upon Zola's dictum that the streets of the metropolis are both pathetic and inspiring; their irregular beauty "enough for any poet." Mr. John Hall Wheelock, one of our younger pupils in the school of Baudelaire and Arthur Symons, whose melody he lacks, registers

> "A nightmare screech from hell;
> From arch or hidden hollow comes the yell.
> Screeched of some wanton tabby
> Indecent."

Mr. Joyce Kilmer sings "The Subway," with its freight of

> "Tired clerks, pale girls, street-cleaners, business men,
> Boys, priests and harlots, drunkards, students, thieves."

Mr. John Masefield, a gutter Byron with

a greater fund of experience and sincerity than most of the American celebrants of the unbeautiful, sings the navvy,

"With arms all red from wallowing in the muck,
And spitting, as the trolley tipped, for luck."

The city poets have made progress—of a kind—since one of them wrote, long ago, "The Crowded Street":

"Let me move slowly thru the street,
Filled with an ever-shifting train,
Amid the sound of steps that beat
The murmuring walks like autumn rain."

And if flowers bloom in the verse of the city poets it is, more likely than not, in some shop window. Thus Mrs. Gilman:

"I hear, in raw, unwelcome dawns,
The sordid sparrows sing,
And in the florist's windows watch
The forced and purchased spring."

Indeed, natural objects have a very slight chance of finding their way into the verse of these poets of our big towns unless it be for the purpose of heightening some contrast—and Mr. Eaton writes:

"It's Spring today; I know the sight—
The smell of asphalt fills the air,
The gas-pipe men are mending lines
And digging ditches in the square."

In American magazine verse the East River with its ferries and bridges mountain-high takes the place of Rhine and blue Danube; the "cascading thunder" of city streets takes the place of Niagara Falls; the recreation park crowds out the "glimmering landscape"; lamp-posts replace the sentinels of the forest. At first sight, we seem to gain a certain novelty by the exchange.

But it is not a permanent bargain. Nature poetry lurks in the background of all this man-made machinery, and throbs under its urban cacophony. These newer cadences exist chiefly because they are the contraries of the old-fashioned order of poetry. There is for the moment a reaction against images grown too familiar, trees and flowers already painted by Wordsworth and Mr. Cawein as delicately, it seems, as ever they can be painted; sentiments staled, as it were, for the present generation of poets, by Shelley and Tennyson and Rossetti. Therefore are our contemporaries bent on out-bawling Baudelaire and outwhizzing Whitman; but they have gone almost as far as their tether allows. True, the city furnishes as many suggestions of pity and horror as the country or suburbs,—rather more of them, even. The fact remains that we do not wish, week in, week out, to be fed on horrors or to feast our eyes upon faithful limning of carters, 'longshoremen and department store floorwalkers. The moment we accept the plausibility of the city as a theme for verse we are ready to return to the country again. It is rural delights that are most refreshing; and, if our hearts are to be reached, if our sense of "impassioned recollection" is to be kindled, it is the country which poets must celebrate for us. What tho the poets of what we call God's out of doors be townsmen—college dons like Gray and Lowell, lecturing philosophers like Coleridge and Emerson, men of the world like Byron, editors like Bryant? Their verses satisfy our aspirations and better appetites even as we toil among the sordid and oppressing objects which the newer school of city poets is at such pains to reproduce.

Whistling

Those who studied our Vacation Number noted well that remarkable picture which placed in the foreground a whistling boy. The pose of the lad, and that perfect satisfaction which is exprest from his bare toes to his hat, in the arch of the pole over his shoulder, and the basket on his arm—in fact, in every wrinkle of his pantaloons—sums up well in the title given to the picture, "Great Expectations." The foliage of the trees and the absolute bareness of the soil under his feet indicates that Nature has given away entirely all of her purposes and whims, and is absolutely at one with this boy, that he shall fill his basket with fishes. Yet this picture would lose its unity entirely but for that puckered mouth, and the whistle which we do not hear, only it is everywhere dominating.

Look thru the rest of this superb collection, and not one is without its interest; the sea dashes against the rocks, the brooks rumble down stream, the children are noisy at their games, the sheep nibble lovingly on the lawns, the swans preen themselves, and everybody and every-

thing is happy; but nowhere is perfect satisfaction so completely exprest as in the whistling boy.

It happened this morning, as the country editor laid down the Vacation Number, for the dozenth time, and his ear was filled with the choral daybreak song of the robins, that he heard far down in the valley another boy whistling—or was it the same boy? It might have been a lad that was filled with the glory of daybreak and was trying to chime in with the robins; it might have been a lad who had risen early because the fish will bite best at dawn. You can generally tell who it is that talks, and mostly you will know a man by his laugh, but whistling is seldom individualized. One thing about it, the whistler in the valley was intensely happy, and he was in full key with Nature. Everything was happy, and everybody was happy, and so was the editor.

It is, however, possible to distinguish a whistler by the habit that he has of punctuating some special part of the day, either, as now, the very early morning, or the working hours, when he tosses the hay or grain, or the evening hours, when work is laid aside and care is over. Felix was happily named, for a happier soul never undertook to wrap love around the world. He always whistled all over. He whistled himself all to pieces. He went off into a whistle. He came around the end of the lake every evening on horseback, with the mail over his shoulder, the horse taking care of herself, and Felix just whistling, whistling with all his might.

We would like to know if there is any other way for a boy to let his soul fly right off unrestrained. Talking will not do it, altho the gesture language of some races has much in its favor. As we use speech it is formal, dramatical, autographical even. Imagine Felix saying, I am happy! I am jolly! Hurrah, boys! Nonsense, for he could listen to himself only a moment, when he would keep still. No; talking will not do it; not even exclamation; and as for gestures his collie would do it far better. But he can tell it all in a whistle which has never been put into a grammar.

Whistling, then, has its place as mere language. It lets the soul free from fetters of the body. It says descriptively what words make foolishness of. It is not only for joy, but it is also when a boy is out of tune. When he wishes to go fishing, but must go for the cows, he whistles. When he goes by the graveyard at night he whistles to keep up his courage. Then again when he starts off with a good lot of bait in his pocket he whistles over great expectations.

A *man* whistles naturally when in doubt. There is a scientific whistle, something like that which Professor Warder used when he anatomized kittens. If there are three political parties in the field, a man whistles because he cannot quite see his way clear to make a choice, especially when the three platforms try to cover the same reforms. When his mind is made up he uses another kind of language, possibly more expressive to others, but not to himself. He finds it difficult to put partnership into a whistle; so you cannot discover a bigot whistling, or a man who has made up his mind to gouge his neighbors, or engage in any other mean thing. He whistles when he has carried thru a successful deal and is throwing care off his shoulders, but when he is up to a trick he is silent.

You note that animals never whistle, altho they do talk; some of them sing, and some of them wriggle a great deal of wisdom with their tails and noses. Togo talks equally with his tongue and with his tail. He sits just now near the editor's desk and expresses his emotions and his wishes and his hopes wonderfully well. We wonder now why a dog is not in that picture with the whistling boy. He might be there, altho nothing else in the world would be adjustable to the case. Togo laughs when he has won attention, drawing up his lips, showing by his beautiful teeth that he is delighted; but he cannot whistle. Our catbirds are loquacious, and some of them can almost conquer the alphabet, but they cannot whistle.

Whistling is one of the universals, and it is done in the same way all the world around. When a Chinaman whistles he does it exactly like a Yankee, and it is in the same way, whether the boy be a Cossack riding bareback over the steppe or a Cracker picking oranges in Florida,

he shapes his mouth precisely as the lad who goes fishing with great expectations.

Encourage whistling. The boy who never whistles do you look out for. It is the natural language of youth. He should not disturb the household, but out of doors he should be allowed to put on steam, for that is just what whistling means. Perhaps you have already noted that the mean boy has a mean sort of language. It is entirely natural that he should swear. Profanity is not artificial; it is the Esperanto of mean souls. They break into it involuntarily. You wish to know where Tom learned such vile words; he did not have to learn them; it is the expression of inside vulgarity.

Japan and Russia

We see no cause for alarm in the visit of Prince Katsura and Baron Goto to St. Petersburg. If it means what it is supposed to, that Japan and Russia have reached a good understanding, so much the better prospect for the continuance of world peace. It has been said that the treaty of Portsmouth was merely a truce, that the Nobel committee were wrong in giving the peace prize to Roosevelt, because in inducing the belligerent Powers to lay down their arms he was merely postponing an inevitable conflict, which would come later in a more terrible form. But it seems now that these pessimistic prognostications are wrong. It is rumored that the agreement portends the rapture of Manchuria and Mongolia from China, and that China has appealed in vain to the United States for protection against Japan and Russia. There is no evidence that these rumors are correct, but we take this occasion to repeat what we have often urged, that our Government has been gravely delinquent in failing to give its encouragement and moral support to the struggling republic, and if it should fail, as we pray God it may not, America would be largely responsible for the great disaster. As the first and greatest of republics we should have been the earliest and readiest to extend our congratulations to a people throwing off the yoke of tyrants. Instead of that we held coldly aloof and even allowed our name to be associated with the monarchical Powers which were supporting the Manchu dynasty. And nine months after the republic was proclaimed and six months after the abdication of the Emperor we still deny recognition. We are united with Russia, Japan, Great Britain, France and Germany in a refusal to grant such recognition unless China will borrow $300,000,000 of us all and will permit us to control the expenditure of it to see that it is spent for our own goods! It is just as if a rich man should say to his needy neighbor: "I won't speak to you on the street unless you will borrow money of me to spend in my shop for things I think you need." Read the touching appeal of President Yuan Shi-kai in a recent interview and see if it does not point to a neglected duty, a duty which we owe to civilization, to speak an encouraging word, if not to lend a helping hand, to the infant republic now trying "to stand alone":

"Peace is everywhere in China today; and without foreign interference peace will reign uninterrupted. We appeal as men, as a nation, to the men and nations of the world to give us without tampering that right which is the right of every householder, to keep his own premises in order.

"The Government, however, is moving cautiously in the matter of finances. We realize that a weak nation in debt is a pauper who must sooner or later go to the poorhouse or the graveyard. There are friendly Powers, such as the United States, for instance, which would make financial advances to us and give us time to pay; but if we do not have to borrow in this way we will be better off—for debts must be paid some time, and often the interest is a galling burden.

"New China wishes to stand alone. She is capable of it, and will stand well if no pitfalls or snares are made for her feet."

The Suffraget Sentences

We are glad to see that the British suffragets are being treated with the severity that their crimes deserve. Mrs. Mary Leigh, who threw a hatchet at Premier Asquith and hit John Redmond, and Miss Gladys Evans, who set fire to the Theater Royal, Dublin, where the Premier was to speak, were both sentenced to five years' imprisonment. The suffragets have urged that their violence be condoned on the ground of their motives and that they be entitled as "political prisoners" to especially kind treatment in jail. But to concede this would be a monstrous perversion of the Anglo-Saxon idea of justice, which is based upon the principle that crime is crime

however good the motive. That Guiteau shot Garfield to restore harmony to the Republican party, that the MacNamara brothers blew up the *Times* building to advance the cause of labor, that Miss Evans set fire to the Dublin theater to obtain the vote for women does not in any way palliate their crimes. Tho the women of England are outlaws, that is no reason why they should be lawless. Attempts at arson and murder are not admissable forms of electioneering in a civilized state. Such action is more than a crime; it is a blunder. In many parts of the world women have now attained their political rights, but in no case by the use of violence. Campaigns for the suffrage are now being carried on in six States, Michigan, Ohio, Wisconsin, Kansas, Oregon and Arizona, but there have been no violations of law or even of propriety, and the same was true of the campaigns by which six States have already gained the suffrage. In England, on the other hand, the militant tactics have accomplished absolutely nothing so far, and it looks as tho they had destroyed all prospects for its success in the immediate future.

Coppered Food

Who says now that the Referee Board is too conservative? They seem, on the contrary, determined to out-Wiley Wiley. It was not many years ago, when Dr. H. W. Wiley was the head of the Bureau of Chemistry, that he was reported as saying that he liked French peas greened with copper and he did not see why anybody should prevent his having them. But now, when he is out of the Department of Agriculture, Secretary Wilson rules out all food greened with copper salts as adulterated, basing this ruling on the authority of the Referee Board of Consulting Scientific Experts, which reported that "it appears from our investigations that, in certain directions, even such small quantities of copper [as 10 to 12 milligrams a day] may have a deleterious action and must be considered injurious to health." Unfortunately the Department will not publish till later the evidence on which the board bases its decision, so it is impossible to judge of the validity of this somewhat surprising conclusion. The practice of brightening peas and beans and cucumbers with copper salts has been common in household and cannery for generations, and no one appears to have been harmed by it. Our grandmothers used to borrow the neighbor's brass kettles to scald up their pickles to give them a good color, and if they could not get one they would drop a penny into the hot vinegar. How it would have shocked these notable housewives to know that they would be in danger of fine and imprisonment as adulterators if they sold or exposed for sale their gherkins, chow-chow and piccalilli. And now what shall we do with the Parisian chemist who, in order to test the question, put copper salts in his food until it all was green and had a metallic taste. According to the Board of Food and Drug Inspection he should have died, or at least been sick, but being unaware of their opinion, he felt none the worse for it.

The Devil

Have we got rid of the devil or have we not? That is the question. In the April number of the *Journal of Religious Psychology*, published by Clark University, Worcester, an article by Collys F. Sparkman is confidently headed "The Rise, Growth and Death of Satan." But in Cambridge, only a few miles away, they evidently have not heard of his death, for in the July *Harvard Theological Review* appears an article on "The Evil One: A Development," in which John Edwards Le Bosquet, of Boulder, Col., argues that

> "Evil is not usually—so far as experience goes—a negative matter, a sign of immaturity alone or chiefly; it is positive, keenly hurting, affrighting. . . . One may theorize in one's study as tho it were negative, but for those who have struggled with a habit that is ruinous, or have felt the grip of a hard temptation, sin is something with its own appealing individuality, with its own thews and muscles, loves and hates. . . . Go into politics, fight for a clean municipality, and one must soon realize that evil is, tho not so strong in the long run, yet every whit as positive as good. . . . . So with calamity, sickness, microbes, they are not mere 'growing pains'; they have a hateful, devouring, crushing aspect. They live for themselves and against what is for our weal."

The author points out that this view is in accordance with the present trend of philosophic thought—that is, the opposition of the pragmatists, pluralists and

realists to the absolute idealism formerly dominant, and he concludes by saying

"Whether or not one goes on to believe that it is characteristic of the real evil in the world to be personal, will depend upon how fundamental to reality of existence the concept of personality is held to be. There are many, like myself, who cannot conceive of an impersonal positive force for evil."

Rousseau—Musician

The bicentenary of Jean Jacques Rousseau serves M. Lalo, the critic of the *Temps*, as an excuse for discussing his musical attainments—one part of the recent celebration at Paris having consisted in a performance of his opera, forgotten except by title, the "Devin du village." "What is curious," writes M. Lalo, "is that there isn't the slightest trait common to the style of Rousseau musician and the style of Rousseau, writer," As a musician he was superficial, "falsely simple," and inanimate. To be sure, he was the most powerful musical critic of his day: the more the pity, since he was "the mortal enemy of French music," no one surpassing him, not even the German, Grimm. Rousseau as a lover of Italian music was sure to incur the wrath of M. Lalo, whose one idea it is, in all his articles, to protest against the departure from national and classical ideals by French musicians or French opera houses. As to Rousseau's real value as composer and critic of music, we are not rash enough to hazard an opinion. At any rate he copied music when out of funds. His reputation would certainly have been safer had he confined himself to that and botanizing—but then he wouldn't have had a reputation to jeopardize.

A Municipal Nurse

Two Rivers, Wis., is to have a visiting municipal nurse. She will be provided by the Ladies' Charitable Association. It is expected that the nurse will be at the service of the public to assist surgeons in difficult surgical cases in the homes of the city, where it is impossible to send for a nurse in time to be of use. She will visit from house to house, aid mothers in the proper care of infants and children who may be in need of nursing; in such cases the people may pay a regular visiting fee, so that they are not dependent upon charity, the money so received being paid into the treasury of the Charitable Association. In the schools the nurse will assist the medical inspector in the examination of school children and the education of schoolgirls and factory girls in matters of hygiene and health.

Many people say we have too many societies nowadays, but when you ask them how to put a stop to it the only thing they can think of is to organize an Anti-Club Club, with a president, three vice-presidents, secretary, treasurer, constitution, by-laws, and a silver badge with the letters A, C. C. artistically intertwined and a motto from Ibsen inscribed underneath: "The strongest man in the world is he who stands most alone."

Doctor Eliot, who has just returned from his world tour in behalf of international peace, "found in China and Japan the strongest and most universal desire for peace." There it was that he found, in all ranks of society, war "hated and feared." Verily doth the sun rise in the east!

Some people nowadays base their faith in miracles on a woman in England who can tell the ace of spades with her eyes shut. Strange that what our Puritanic forefathers called the "Devil's Picture Book" should to their descendants become confirmation of Holy Writ.

In the fashion notes from Paris this week comes a prophecy of gowns with neither hooks nor buttons, back or front. If they come into vogue women will have less use for their husbands than ever.

Every man is to be presumed innocent until he is proven guilty except a judge.

Toleration of faults is a good thing so long as we don't extend it to ourselves.

Duty is what makes you feel bad when you don't do it.

But, anyway, the crops are good this year.

INSURANCE

Life Insurance in 1911

We are in receipt of Part II of the annual report of the New York Insurance Department, covering the financial condition at December 31 last, and the business operations during 1911 of the life insurance companies subject to the jurisdiction of that department.

The aggregate assets of the thirty-four companies reporting is shown to have been, on the date mentioned, $3,942,144,356. This shows a gain of $248,896,028 over the previous year. The liabilities, excluding gross surplus and special funds, were $3,727,340,150, leaving as surplus and special funds the sum of $214,804,206. Of the latter, $78,946,053 belonged to New York companies.

The total income for the year was $754,533,218, of which the premiums were $564,754,884. The eleven New York companies received of this amount $289,933,398, and the twenty-three companies of the other States, $274,821,486. The increase in total income was $37,880,482, that of the New York companies being $7,028,108, companies of other States, $30,852,374. Of the total disbursements, which were $526,742,699, the sum of $390,098,215 was paid to policyholders. The cost of management, including dividends to stockholders, was $136,644,484—about 18 per cent. of the income.

The dividends to policyholders, paid in cash or its equivalent, aggregated $80,073,569, which, calculated on the basis of premiums, average about 14 per cent. These figures do not include dividend accretions during the year to the outstanding deferred dividend policies.

During 1911 the thirty-four companies issued 811,462 policies, covering $1,577,846,249 of insurance, the gain over the previous year being 64,434 policies and $142,005,043 of insurance. Of these amounts the New York companies issued 389,628 policies for $686,677,019, the increases being, respectively, 7,587 policies and $8,670,635 insurance. The companies of the other States gained 56,397 policies and $133,334,358. As will be seen, the average of gain per company, as between New York companies and those of other States, is in favor of the latter.

As to total insurance in force on December 31, 1911, there was $12,802,989,204 under 6,621,386 policies, an increase over the same days in 1910 of $682,141,142 insurance and 345,195 policies. All the foregoing as to insurance in force applies to what is known in the business as "ordinary" as distinguished from "industrial."

During 1911 there was a gain of industrial insurance amounting to $201,282,613, the full amount of that class in force on the last day of the year being $3,199,098,003.

Adding "ordinary" and "industrial" together we find that the thirty-four companies reporting to the New York Insurance Department have in force in excess of $16,000,000,000!

The Superintendent of Insurance concludes from the reports compiled in his office that the business of life insurance is in a healthy state. There has been a marked increase in the dividend returns to policyholders; the amount of new business issued and paid for has steadily increased during the past few years; the lapse ratio, while a fraction higher, has not been unsatisfactory, and is probably due to the increased cost of living; the investment earnings on the companies' assets have been larger; and management expenses have been lower. The life insurance business, "taken as a whole," he says, "is in a remarkably healthy and satisfactory condition and in great contrast to that obtaining prior to the passage of the legislation affecting life companies in 1906."

By way of comment on this observation we are to bear in mind that the legislation referred to mainly affects New York companies, and, as the figures quoted indicate, these seem, as to the rate of growth, to be at some disadvantage as compared with the companies of other States. We are certain that the general effects of the legislation have been beneficial; but there are features which, in the judgment of conscientious and skillful underwriters, are unnecessarily harsh and result in retarding the progress of New York companies.

FINANCIAL

Another Good Crop Report

On the 9th another favorable crop report was issued. A yield of 680,000,000 bushels of wheat was indicated on the 1st, and fine weather since that date may have added enough to make a total of nearly 700,000,000. If only 680,000,000 are harvested, however, this quantity will exceed last year's crop by 59,000,000, and will be quite satisfactory, in view of losses which have made the winter wheat crop the smallest since 1904. The promised crop of corn, 2,811,000,000 bushels, has been surpassed only twice, and a great crop of oats will make a new high record, exceeding last year's by 285,000,000 bushels. Present indications and last year's crops are shown below:

	Indicated, Aug., 1912.	Harvest, 1911.
Corn	2,811,000,000	2,531,488,000
Spring wheat	290,000,000	190,682,000
Winter wheat	390,000,000	430,656,000
Total wheat	680,000,000	621,338,000
Oats	1,207,000,000	922,298,000
Rye	35,000,000	33,119,000
Barley	202,000,000	160,240,000
Buckwheat	16,000,000	17,549,000
Flaxseed	28,000,000	19,370,000
Rice	23,000,000	22,934,000
Potatoes	371,000,000	292,737,000
Tobacco (lbs.)	980,000,000	905,109,000
Hay (tons)	73,000,000	55,000,000

A new record for barley is promised, and the condition of hay advanced 6 points in July. The apple crop (as to which the report gave only a condition percentage) is the largest since 1897, and a considerable increase of exports is predicted.

Investment Bankers' Association

It has been shown by the Post Office Department that the people of the United States were robbed last year of $120,000,000 by scoundrels who used the mails to commend and to sell worthless bonds and stocks. One of the aims of an organization, the Investment Bankers' Association, formed last week in New York at a convention of more than 150 representative investment bankers, doing business in many cities, will be to defend the public against such rascals. There will be a bureau of investigation, which will inquire carefully as to the character of issues referred to it. The association will also work for uniformity of State laws governing the issue of municipal and public service securities, and in many ways will serve the interests of the investing public and of the bankers and brokers who are associated in it. The convention was held under the auspices of a committee led by George B. Caldwell, vice-president of the Continental Trust and Savings Bank, of Chicago, who presided as chairman and made an excellent address. The officers elected are as follows:

President, George B. Caldwell, Chicago; first vice-president, A. B. Leach, New York; second vice-president, Ex-Governor Frank W. Rollins, Boston; third vice-president, William R. Compton, St. Louis; fourth vice-president, Lewis B. Franklin, Guaranty Trust Company, New York; fifth vice-president, Warren S. Hayden, Cleveland; secretary, Frank R. Fenton, Chicago; treasurer, C. T. Williams, Fidelity Trust Company, Baltimore; and a board of governors, having twenty-four members.

We are confident that this new association will promote the public welfare by discussion, inquiry, publicity and the exertion of its influence in many directions. Its first annual convention will be held in October or November next.

....It is announced that The Aluminum Company of America will invest $26,000,000 in a new plant, two and a half miles from Knoxville, Tenn., taking power from the Tennessee Power Company.

....Experts of the Department of Agriculture say that more than $45,000,000 is lost every year by American egg producers and dealers by improper handling and packing.

....The index number (for commodity prices) compiled by *Bradstreet's* is 9.1595 for August 1, against 9.1119 for July 1, and 8.6568 for August 1 a year ago.

....July's pig iron output was 2,410,889 tons, against June's 2,440,745. Steel prices, which were increased in July, are now about equal to the high record of 1911.

....The British income tax yielded, in the year ending with March last, £44,334,000, of which England contributed £38,421,000, or nearly 87 per cent.

Survey of the World

National Politics

Addressing members of the Maryland Editorial Association at the White House, on the 16th, Mr. Taft spoke as follows of the new party and its Presidential electors:

"All we ask is a fair fight. A man cannot be in the Republican party and in a third party at the same time and should be compelled to make his selection. Regularity or the feeling of regularity and respect for the Republican party, for what it has done, what it is capable of doing, are going to bring over into the Republican party many a man who has been doubtful, and it is going to increase that number, in my judgment, as we approach the election. It is, therefore, essential that we make the cleavage as clear as it can be made, so that those who are Republicans shall be Republicans, and those who are with the bolters shall bear their name and title, and not be Republicans and bolters, because they cannot be—at least they ought not to be in all fairness. We ought to have electors in each State bearing the emblem of the Republican party, bearing the names of the candidate of that party for President or Vice-President at the head of the ticket, covering the electors who are going to vote for those names. If there are any men on that list who are not going to vote for the men at the head of that ticket, I don't hesitate to say that they are dishonest men, in that they are holding out to the people who are to vote for them an implied promise that they will vote for the names on the ticket, when they, in fact, intend to vote for somebody else. I think that is just following the plainest kind of principles of ordinary morals."

William Barnes, Jr., chairman of the New York Republican Committee, has been appointed a leading member of the campaign advisory committee. Among the other members are John Wanamaker and Senators Root, Burton and Lippitt. ——Walter K. Landis, postmaster at San Juan, Porto Rico, has been removed for neglect of duty. His successor is Robert O. Todd. Mr. Landis is a supporter of Mr. Roosevelt, and his brother has been nominated for Lieutenant Governor of Indiana on the Roosevelt ticket. The charge of neglect was supported by the report of an inspector sent to Porto Rico.——Senator La Follette announced, in the Senate last week, his unswerving allegiance to the Republican party and attacked Mr. Roosevelt, during the term of whose administration, he said, the number of Trusts was increased from 149 to 1,020.——Ex-Senator Edmunds, who drafted the Sherman act in 1890, said last week that if Mr. Roosevelt should be elected, the Trusts would flourish without molestation during his term. He criticised Mr. Roosevelt's course with respect to the Steel Trust and Harvester Trust. Mr. Roosevelt (who supported Mr. Edmunds for President in 1884) said in reply that the ex-Senator was in accord with the Standard Oil and Tobacco Trusts, and that his views were those of every great crooked corporation.——Mr. Roosevelt began his series of campaign speeches on the 16th in Providence, attacking the bosses and denouncing both of the old parties. In his remarks about the tariff he spoke of reports that the present cotton goods schedule was written by Mr. Lippitt, a manufacturer, who is now a Senator from Rhode Island. He said:

"If the Democratic platform were carried out in good faith your factories would have to close altogether for their proposal is to prevent the Mr. Lippitts from prospering by the simple process of preventing every one from prospering. The Republican proposal is only to give prosperity to the Mr. Lippitts and then to let it trickle down according as they may condescend to permit such trickling. Our proposal is to keep the factories open, to see that the Mr. Lippitts receive full justice, but to see also that they do justice

as well as get it, that they do justice to the wage workers whom they employ and to the customers whom they serve, and make their own profits only as an incident of thus rendering service to the advantage of the public as a whole."

He made four speeches in Boston, and much that he said related to the labor paragraphs of his platform. George W. Perkins and William Flinn had come to him, he asserted, declaring that they desired to support a movement for improving the relations of capital and labor, in order that the country might be a good place for their children.——Rolla Wells, formerly mayor of St. Louis, has been made treasurer of the Democratic National Committee, which has established a bureau to deal with questions of race and religion, owing to inquiries as to Governor Wilson's opinions about immigrants, the Catholic Church, etc.——The Governor spoke to 2,500 farmers at a picnic in New Jersey, on the 15th. Our present tariff, he told them, was one of the greatest impositions upon the farmer that had ever been devised. Mr. Taft's veto of the steel tariff bill had affected the cost of farmers' tools. Business enterprises should stand on their own bottoms and not be propped up by taxes which all were compelled to pay. That great dam running around all our coasts was called a protective tariff:

"I would prefer to call it the restrictive tariff. I would prefer to call it the tariff that holds us back. I should prefer to call it the tariff that hems us in, the tariff that chokes us, the tariff that smothers us, because the great unmatched energy of America is now waiting for a field greater than America itself in which to prove that Americans can take care of themselves. . . . You people own a big house, but you have let the other fellow live in it. It is time to turn him out. What I modestly suggest is that you proceed to break into your own house and live in it. The tenants who have been there a long time have been making you pay them the rent, instead of paying rent to you. You have paid the money that enabled them to live in your own house and dominate your own premises. Turn them out."

Congress

The wool tariff bill was passed in the House over the President's veto by a vote of 174 to 80. Sixty Republicans were absent, and 21 were counted with the Democrats in the affirmative. But in the Senate the veto was not overridden, the vote there being 39 to 36. In the House, the veto of the steel tariff bill was overcome by a vote of 173 to 83, with the help of 16 Republicans, but in the Senate the veto was sustained, 32 to 39, by a party vote. At the end of last week it was not expected that further action upon the tariff would be taken at this session. The Senate had passed the Democratic cotton bill. The conferees upon the sugar bill had not been able to agree. Mr. Taft vetoed the legislative, executive and judicial appropriation bill because it indirectly abolished the Commerce Court and made a seven years' tenure of office for employees in the Washington departments. This veto was not overridden, the vote in the House being 153 to 107. Against the President 13 Republicans were counted, and 18 Democrats broke away from their party.—— In caucus, the House Democrats decided, 95 to 11, to support the construction of one battleship. On August 19, a conference of representatives of the House and Senate agreed to provide one battleship at a cost not greater than $15,000,000, with an appropriation of $2,535,000 available for beginning the work. No agreement was reached as to size, dimensions or armament. The naval bill adopted was in other respects as approved by the last conference, providing eight submarines and a round-the-world wireless system.——Theron E. Catlin, Republican representative from Missouri, was unseated by a vote of 121 to 71, because he and his relatives spent $10,200 to promote his election.—— There is a movement for the impeachment of Senator Penrose because of the payment of $25,000 to him in 1904 by John D. Archbold, of the Standard Oil Trust. The Senator says the greater part of the money went to the campaign committee and was used in carrying New York for Mr. Roosevelt.——The House bill for an industrial commission of nine has been passed in the Senate. ——President Schurman, of Cornell University, has been appointed Minister to Greece.

Panama Canal Bill

The Panama canal bill, as shaped in conference, was passed in the Senate on the 16th by a vote of 48 to 18, and in the House on the following day without a division. In confer-

ence the toll exemption of American ships engaged in the foreign trade was eliminated, but the other provisions passed by the Senate were in substance retained, and there was added a remission of tariff duties on imported materials to be used in building or repairing American ships. These provisions include American registry for American-owned foreign-built ships used in foreign trade, the exclusion of Trust-owned ships, free passage for American coastwise ships, and the paragraphs relating to ships owned by railroad companies. These companies must divest themselves of the ships if they cannot prove that competition is not excluded, prevented or reduced by their control. At the end of the week some thought that the bill would be vetoed, as the President, in letters to members, had given indications of disapproval or shown a desire for delay with respect to certain parts of the measure.

Trusts The Government has begun a civil suit in Philadelphia against what is called the Moving Picture Trust, asking for a dissolution of the Motion Picture Patents Company and the General Film Company. Ten corporations and eleven officers are the defendants, and the cancellation of interlocking license restrictions which tie patents together is sought. It is alleged that the people are deprived of the advantages of competition. More than $100,000,000, it is stated, has been invested in the business, and from 2,500,000 to 3,000,000 feet of pictures are printed and distributed every week. The suit is an important one because the relation of our patent laws to the Sherman act is involved.——There is to be a suit in Illinois for the dissolution of the Elgin Butter Board of Trade, which, it is asserted, controls prices in several States. ——The Senate Judiciary Committee has declined to report Mr. Pomerene's resolution directing the Attorney-General to bring criminal suits against officers of the Standard Oil and Tobacco Trusts. The resolution has been taken from it and placed on the calendar. Mr. Pomerene says the Attorney-General has not done his duty.

Labor The wages of 15,000 street railway employees in Chicago have been increased, and the demands of railway employees in Springfield and Worcester, Mass., have been laid before arbitrators.——An arbitration board has taken testimony concerning the demands of the locomotive engineers of fifty Eastern railroad companies, and now similar demands, involving $25,000,000, have been made by the firemen. It is expected that a settlement will be reached in some way, but the companies desire to wait for the approaching decision in the engineers' case.——Clarence S, Darrow, counsel for the defendants in the McNamara dynamite case, who has been on trial in Los Angeles for bribing a juror, was acquitted on the 17th. He may be tried again, on a second indictment relating to another juror.

The Islands Our Government has asked Cuba to pay American claims for about $500,000, due on contracts for waterworks and sewers at Cienfuegos.——Replying to the mayors of several cities who visited him recently, President Gomez said he might accept a renomination if the interests of his party could be served in that way. It has generally been understood that he would not seek another term. ——Haytian exiles in Jamaica are preparing to attack the Government of the new President. Their leader is ex-President Simon, who was driven from office by the revolutionists whose commander was the late President Leconte.—— Refugees arriving in New York from the northern part of Santo Domingo say that 400 soldiers, a majority of them in the service of the Government, were killed when the revolutionists captured Dajabon, a few days ago. An impression prevails in Santo Domingo that the revolutionists are aided by Hayti.—— Porto Rico's foreign trade in the last fiscal year was $92,000,000, or $14,000,000 more than that of the year immediately preceding.——An inter-island parcels post will be in use in the Philippines after October 1, and the maximum weight allowed for a package will be 11 pounds.——Secretary Fisher intends to

start on the 25th for Hawaii, where he will make an inquiry as to the charges against Governor Frear.——No additional cases of plague were reported last week in Porto Rico or Cuba.

The Revolt in Nicaragua

Nicaragua's revolutionists, led by General Mena and General Zeladon, bombarded Managua, the capital, for four days, beginning on the 11th. This was done against the protest of the American Minister and in violation of an armistice agreement. Twelve women were killed in the city. Shells struck a hospital, where several patients were killed. One fell within a few feet of the American Legation; another struck a table at which President Diaz and members of his Cabinet were sitting. None of these was hurt. Dispatches from Managua say that the 100 marines guarding the Legation and other American property assisted in the defense, and that their marksmanship was effectively exhibited. On the 14th, 354 additional marines, with 11 officers, landed at Corinto and went at once to Managua. On the following day the rebels withdrew. Reports from the Government side say that the rebels have suffered heavy losses. Mena offered peace if Diaz would restore him to office, appoint a new Cabinet in his interest and expel the Federal military commander from the country. In the Senate at Washington, on the 15th, Mr. Bacon introduced a bill designed to prevent such a use of American marines in foreign countries without authorization by Congress. The action of the marines at Managua was disapproved by him.

Mexico's Revolutionists

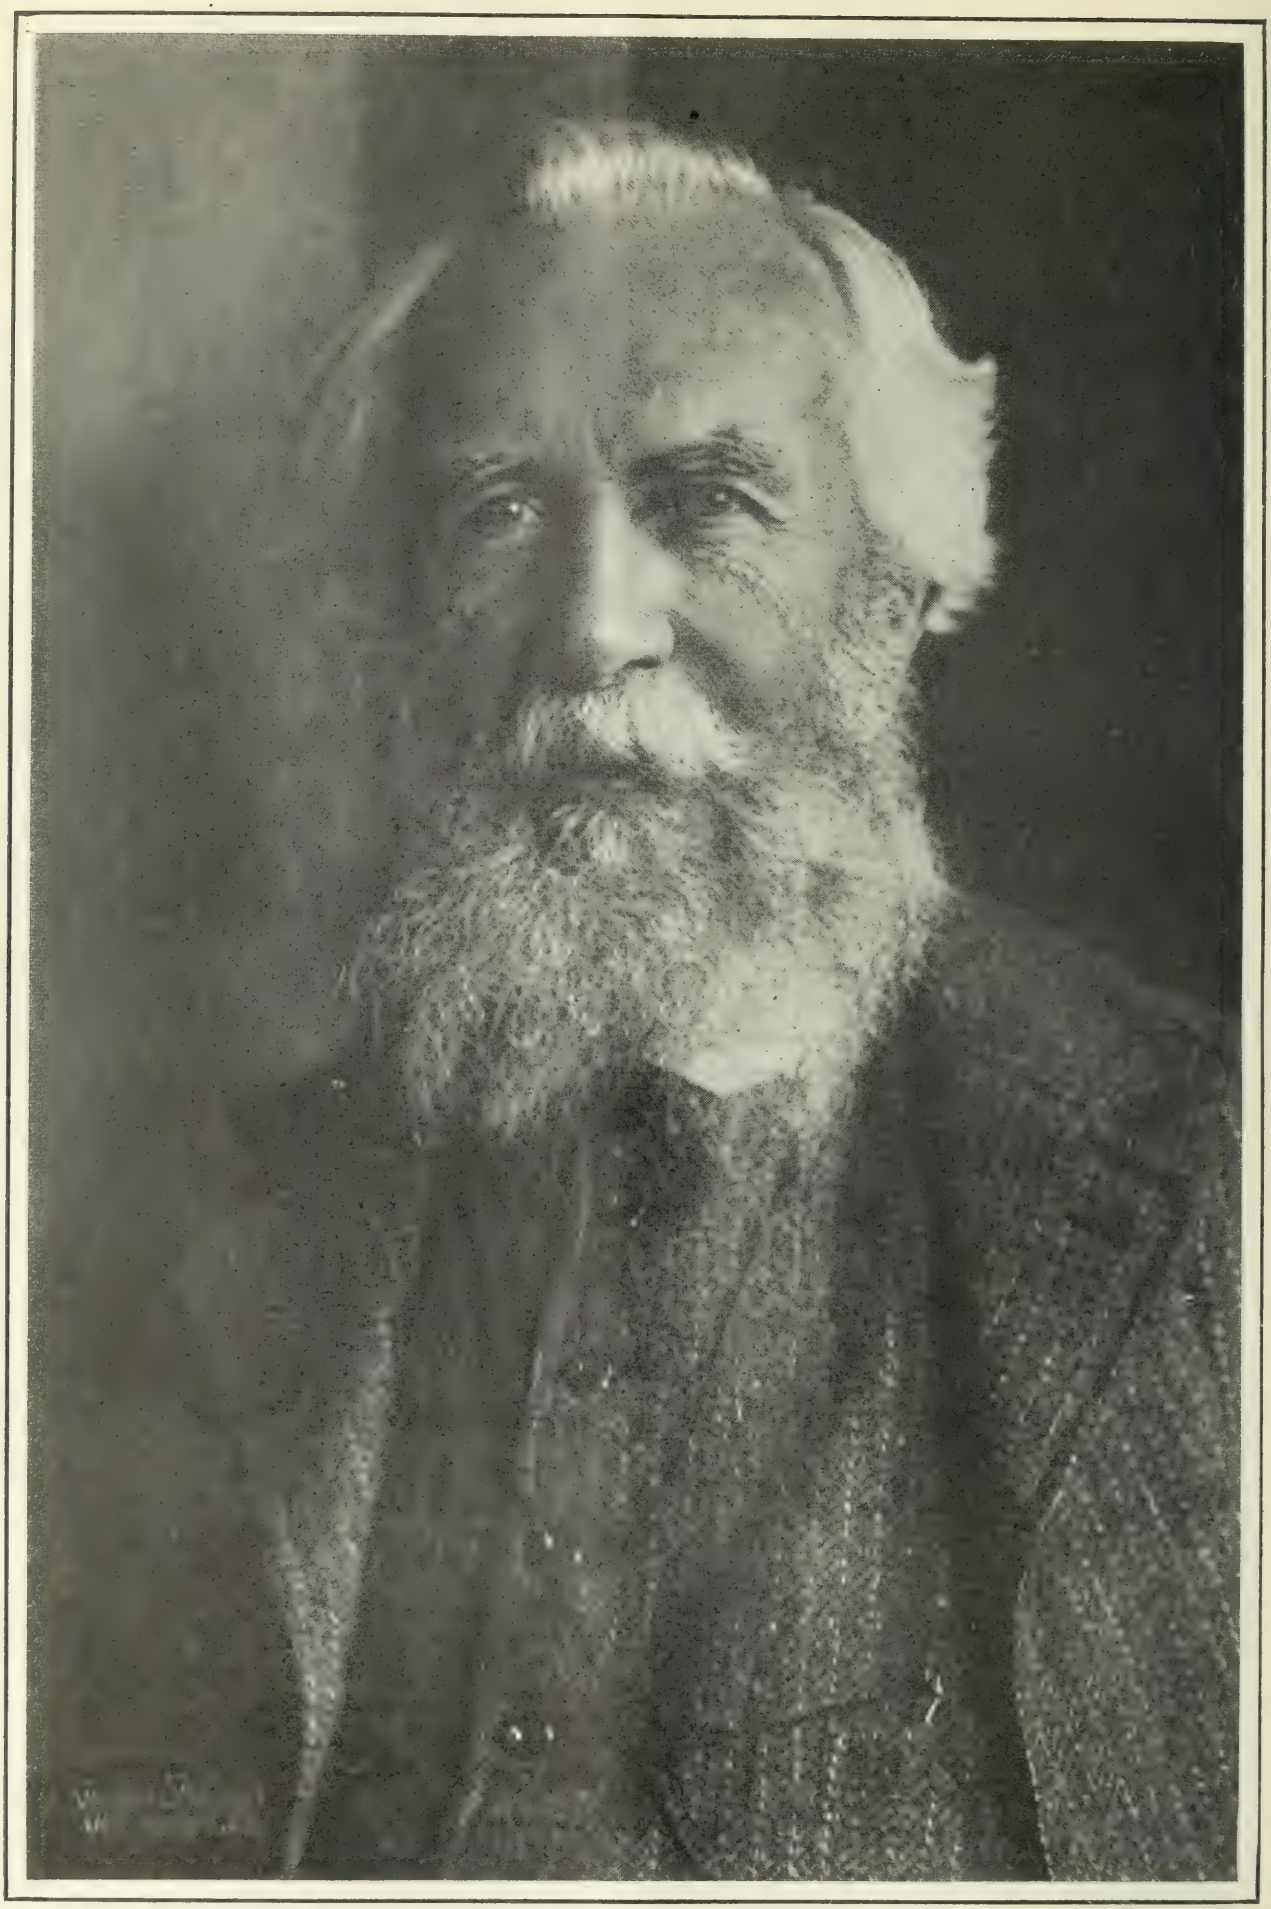
While Orozco, in the north, has been beaten, and his followers are making their way westward, on routes not far from the boundary, Madero's Government is menaced by the Zapatist revolt within a short distance of the capital. On the 11th, Zapata's men derailed a passenger train in a canyon near Ticuman, 110 miles southeast of Mexico City, and killed thirty-five soldiers and twenty other passengers. Only eleven of those on the train escaped. Many were shot in their seats, and others were shot or clubbed to death when they left the train. The Zapatists set fire to the wreck, and many of the wounded were burned to death. Among the dead were three well-known correspondents of Mexican and other newspapers. One, Gerald Brandon, the son of a Panama merchant, had been educated in New Jersey, and was a follower of Madero in the latter's revolution. Another, H. L. Strauss, was the son of Leon Strauss, representative in New York of *La Prensa,* the leading newspaper of Buenos Ayres. In Ixtapa, the Zapatists killed all of the 100 rurales who garrisoned the town, and about 100 citizens. The State of Mexico is almost wholly in their hands. Federal troops have recently suffered three defeats there, with a loss of 200 men. Zapatists appeared in the night, last week, on the ranch of Porfirio Diaz's son, only 7 miles from the national capital, but were driven away by cavalry. There are said to be 5,000 of them in the State of Mexico, and for a long time they have been dominant in the State of Morelos.——In the north, Orozco evacuated Juarez on the 16th. His army is scattered along westward, near the boundary, which his men occasionally cross to steal horses. American troops attacked a party, last week, near Fort Bliss, Tex., after the rebels had fired upon them. One rebel was killed, and several were captured, with 50,000 rounds of ammunition which they were smuggling across the line. Americans on the border are exposed to the raids of Orozco's men and are asking for protection. The negotiations with Orozco for peace appear to have come to nothing. He demands the resignation of Madero, the appointment of a provisional President satisfactory to himself, and then a new election. The Rev. Dr. Tupper, of Brooklyn, N. Y., vice-president of the International Peace Forum, had a conference with Orozco last week. It is reported that American officers have unearthed a plot for a new revolt or uprising, distinct from Orozco's and hostile to him as well as to Madero. Rowan Ayers, an American civil engineer engaged in railway construction, has been captured and beheaded by rebels in Michoacan.

South America William B. MacMaster, vice-consul of the United States at Cartagena, Colombia, since 1904, was murdered by unknown persons on the 11th while he was hunting on his ranch, ten miles from the city. He was shot several times in the back. About two years ago he killed a native in self-defense, was tried for murder, and was acquitted by the lower court. By an appellate court, however, he was found guilty and would have been imprisoned if our Government had not procured a new trial. This resulted in his acquittal. Afterward he was attacked by several Colombians and dangerously wounded. He pursued these assailants in the courts, and it is thought they or their friends murdered him. He was born in Colombia, of American parents.——Mr. Dubois, our Minister to Colombia, who is now in Washington, has been discussing with the State Department plans for a settlement of the Panama controversy.——Answering inquiries, Peru says that her constitution will not permit the establishment of a Protestant mission in the Putumayo rubber district. Great Britain's charge d'affaires at Washington has asked Cardinal Gibbons to start a movement here for a Catholic mission. He also seeks the aid of our State Department. The commissioners sent by Peru to the district, reporting at Lima last week, said that conditions had greatly improved. The worst offenders, he added, were Barbadian negroes hired by the British company.——Bubonic plague has appeared at Santa Maria, Uruguay, where there were 15 deaths in one day of last week. ——A company in Tacoma, which supplies beef to posts in Alaska, finds the supply inadequate, and is about to import beef from Argentina.——Arrangements have been completed in Brazil for financing a plan for sustaining the price of rubber. The project resembles the valorization plan for coffee, to which attention was recently directed by our Government's suit, at New York, under the Anti-Trust law.——Secretary Knox has signed an order for the distribution of the $935,000 paid by Chili in settlement of the Alsop claims, under the decision made by King Edward.

Europe and the Near East A Liberal newspaper in Dundee says that it has "good reason for stating that the [British] Government is watching very closely the sayings and doings of Mr. Bonar Law, Sir Edward Carson, F. E. Smith and other leaders of the Unionist party," hinting that they may be arrested for making inflammatory speeches, and citing the example of Parnell's arrest and imprisonment in Kilmainham.——The drifting of the British population into the larger centers seems to have been counteracted by an increasing growth of the rural population as compared with the urban. During the year 1910-1911 the rate of increase in cities was only slightly greater than that in the country—10.2 per cent. as compared with 11 per cent.—— At a meeting at Havre on August 2 the naval reservists employed on board merchant ships adopted a resolution to the effect that, after hearing the delegates who were going to Paris to submit their claims, and knowing that they had nothing to hope for either from the ship owners or the Government, they had decided to resume work immediately. They added, however, that they did not intend to abandon the struggle, and were more than ever determined to obtain satisfaction.——A contract was signed at Athens on August 13 between the Greek Government and the Vulkan yards in Germany for the construction of a new armored cruiser of 13,000 tons. The vessel is to be delivered in two years' time. The armament and armor plating will be supplied by the Bethlehem Steel Company of Pennsylvania. The total cost, including the complete equipment, will be $6,200,000.——It is reported by the British press that, unless Holland withdraws her opposition to Germany's scheme to impose tolls on Rhine-borne shipping, the latter country will divert the Rhine traffic by constructing a canal via Emden from the German Rhine to the North Sea. This would virtually cut out Rotterdam as a port for European commerce. The proposed canal would be from Emden to Cologne, 200 miles. Antwerp, too, would suffer as a result of this innovation.——The people

of the island of Nikaria have deposed the Turkish authorities and declared their independence. This island is not one of those occupied by the Italians, and it is believed the inhabitants took this step in order to place themselves on the same footing as the people of those islands in the Ægean over which the Italians have established their authority and to establish a right to similar treatment.——Reports gained currency in Cettinje, the capital of Montenegro, on August 16, of another massacre of Christians by Mohammedans in Albania, in the Berana district. Refugees from this district have crossed the Montenegrin frontier. Meantime, 12,000 Albanians are said to have seized Uskub and to be marching on Salonika. One report is that they will release the former Sultan of Turkey, who is a prisoner there.—— The recent earthquakes along the shores of the Sea of Marmora are said to have cost 3,000 lives and to have injured 6,000 persons.——The approaching trip to Switzerland of Yussuf-Izzedin, heir presumptive to the Ottoman throne, is thought at Paris to be connected with peace negotiations between Turkey and Italy. —— The Portuguese authorities continue to discover Monarchist plots and to make many arrests. The convents and monasteries of the old regime are today Republican prisons and are filled with alleged conspirators.——A dispatch to London from Odessa professes to give the inner history of the recent mutiny on board the battleship "Ivan Zlatoust" at Sebastopol, for which ten men were sentenced to death. The revolutionists planned, it is said, to seize the imperial yacht "Standart" while the Czar and his family were on board, voyaging from Nolta to Sebastopol. The Czar was to have been compelled to abdicate his throne or abrogate his powers and proclaim a limited monarchy. The seizure of the imperial yacht was to have been the signal for a general mutiny of the crews of the Baltic squadron, who were to arrest or murder all the officers and attack Cronstadt and St. Petersburg simultaneously. Rigid censorship exercised over the press has prevented any reference to this incident or the recent symptoms of grave dissatisfaction among the rank and file of the army and navy, and the officers of all grades have been compelled to sign an agreement not to discuss any phase of the discontent. Cronstadt has been declared in a state of siege as a precautionary measure. This great fortress and military post is only 20 miles west of St. Petersburg.——M. Kokovsov, the Russian Premier, and M. Sosonov, the Foreign Minister, are to visit France next month to discuss details of the Russo-French alliance. Grand Duke Nicholas Nicholaieivitch is to attend the French army maneuvers as the representative of the Russian army.—— The trial of three youths arrested July 2 for their part in a plot to assassinate Lord Kitchener, the British Agent and Consul-General in Egypt, took place at Cairo, August 13. All were found guilty; their sentences are fifteen years' imprisonment each, only one of them being sentenced to hard labor.

Morocco Mulai Yussef was on August 14 proclaimed Sultan of Morocco in succession to his brother, Mulai Hafid, who abdicated on the 12th. The ceremonies attendant upon the accession of the new Sultan were accompanied by the usual salutes, etc., but the population of Rabat remained indifferent and unimprest. Mulai Hafid has proceeded to France, accompanied by a suite and by his harem. At Marseilles he soon established a record for rapid spending—showering banknotes on beggars, postcard vendors, churchmen and custodians.——The real control of the Moroccan Government continues in the hands of the French Resident, General Lyautey. A severe engagement between troops under the command of General Gouraud and Moorish followers of El Hiba, the Pretender of Sichtala, in which the French routed the enemy, but lost eight killed and forty wounded, occurred at Muley-Bouchta on August 15. The French have lately been on the defensive, and the Resident-General has abandoned Marakesh, one of the three Moorish capitals, until he shall have received further reinforcements. General Lyautey has organized a flying column of 4,000 men under the command of



Colonel Mangin, thus hoping to control the situation in the meantime.—Germany's demonstration at Agadir last summer, and reopening of the Morocco question at the risk of bringing on a war with France, Russia and England, won for the empire a large strip of French Kongo. The German Colonial Office has just issued its report on the freshly acquired territory, renamed "New Kamerun." Press dispatches suggest that Colonial Secretary von Lindequist was justified in his resignation of his office on the ground that he was unwilling to become an accomplice in the settlement with France on the terms arranged. The report admits that whites in New Kamerun are not immune from the sleeping sickness; that all tropical diseases, as well as smallpox, are present in their severest forms; that a stay of even a few months is "murderous" where Europeans are concerned; that the mosquitoes are unbearable; that the southernmost part of the ceded territory is uncommonly subject to inundations; that sand storms are prevalent to the north, and that the economic future of the land is questionable.

The Funeral of Mutsuhito

The funeral service for the Emperor Mutsuhito of Japan, who died July 30, will open at the palace in Tokyo at 6 a. m., September 13, in the presence of the Emperor Yoshihito and the Empress Dowager. The same evening, at 7 o'clock, the Elder Statesmen, the Peers, all the high officials, and the foreign representatives are to assemble at the palace, from which the procession will start at 8 o'clock. The Emperor will meet this procession, which will be very long, interspersed with musicians, torch bearers, priests and officials, on the Aoyama Parade Ground. The coffin containing the body of the late Emperor Mutsuhito is to be drawn by a team of oxen. The entire route will be lined by soldiers of the regular army. Immediately after the arrival of the procession at the Aoyama field the Shinto funeral services will begin. Subsequently the Emperor Yoshihito will read a tribute to the dead monarch, and will be followed by the Empress Dowager, the Ministers of State and others, the musicians meanwhile continuing to play funeral airs. Next the imperial funeral train will depart for Kyoto. The Emperor and the Empress Dowager will accompany the body of Mutsuhito. Further funeral services will be held at Momoyama and Kyoto September 14 and 15. From now on until September 14 the body lies in state in the palace at Tokyo.——Prince Henry of Prussia, brother of William II, will represent the Emperor of Germany at the funeral of the late Emperor of Japan. President Taft will be represented by the Secretary of State, Philander C. Knox, who has been appointed Minister Extraordinary. Mr. Knox departed from Washington August 16. Brig.-General John J. Pershing, commanding the Department of Mindanao in the Philippines, has been appointed Mr. Knox's military aide, and will join the Secretary of State at Yokohama. Rear Admiral Reynolds, commanding the Pacific reserve fleet, will serve as naval attaché to the special embassy. It is reported from Washington that Mr. Knox will meet Prince Henry in Tokyo and discuss Oriental policy. By sending impressive missions the United States and Germany will emphasize, in the eyes of Russia and Japan, their continued interest in the Far East.

In China

Excitement was created in Peking on August 16 by the arrest of the Hupeh generals, who came to the capital from Hankow a few days earlier. General Chang and another general, the original leaders in last October's outbreak at Wu-chang, were tried by a drumhead court martial and put to death at once. The rest were sent to Hankow for execution. These officers were charged with complicity in a recent unsuccessful attempt to provoke a second revolution. They belonged to the Tung Men-Hui, Dr. Sun Yat-sen's original southern revolutionary organization. President Yuan Shi-kai is said to have become alarmed at the violence of the protest; it is understood that the Advisory Council will attempt to impeach him. Yuan is so convinced of the danger of assassination that he has surrounded himself with troops.

Ernst Haeckel

"Monistic investigation of nature as knowledge of the true, monistic ethic as training for the good, monistic esthetic as pursuit of the beautiful—these are the three great departments of our monism; by the harmonious and consistent cultivation of these we effect at last the truly beatific union of religion and science so painfully longed for by so many today. The True, the Beautiful, the Good, these are the three august Divine Ones before which we bow the knee in adoration; in the unforced combination and mutual supplementing of these we gain the pure idea of God. To this triune Divine Ideal shall the twentieth century build its altars."—Haeckel's *The Confession of Faith of a Man of Science.*

THE geographical distribution of German universities is such as to shock the orderly mind of our General Education Board, which, like a trained forester, believes in weeding out, or rather, in not cultivating institutions growing close together. But in Germany the soil is so rich as to support three great universities—Leipzig, Halle and Jena—planted within a circle of twenty miles radius and nevertheless all thriving. Even the overweening development of Berlin University since that city has become the imperial capital has not yet overshadowed the smaller institutions. For, curious as it seems to us Americans, students in Europe are not influenced in the choice of a university chiefly by its size, the splendor of its buildings, or even its athletic record. They seem rather to consider the personality of the professors as the important thing, and will often travel considerable distances, at a cost of 1.16 cents per mile, third class, in order to put themselves under the instruction of a particular man they have taken a fancy to, quite ignoring some other university which from our point of view had a claim upon their allegiance, from the fact that it was nearer or had been attended by their fathers. Jena, the least of the three in the matter of numbers, is not by reason of that willing to confess inferiority to any of its rivals, not even to big Berlin. On the contrary, Haeckel, in his famous controversy with Virchow, apologized with satirical politeness for his opponent's ignorance of zoölogy, on the ground that he could not be expected to keep up with the advance of the science when he had left the little institute of Würzburg for the luxurious appliances and the political and social duties of Berlin. In fact, Haeckel with his fondness for formulation, laid down a law on this point thirty-five years ago which, he says, has yet to meet with contradiction, that "the scientific work of an institution stands in inverse ratio to its size."

Certainly, if seclusion and scholarly traditions are conducive to intellectual achievement, Jena is the place for the thinker.

The university, with 1,817 students, is about a third the size of the University of Wisconsin. The population of the city is about the same as that of Madison. But while Madison has other interests, political especially, Jena is absorbed in the university. Its chief industry, the glassworks, is the offspring of the university, for it was thru the fortunate collaboration of Ernst Abbé, a professor who could figure out indices of refraction, with Carl Zeiss, a glassmaker who was willing to put money into queer formulas, that the new lenses were discovered which make possible our modern photography and microscopy. Generously has the debt that the industry owes

to science been repaid, for the Zeiss company has borne a large share of the expenses of maintaining the university and erecting its new buildings, besides giving to the city many public buildings, among them a splendid bathhouse, an auditorium and a free library and reading room, where are on file 115 daily papers and 360 periodicals (American librarians, take notice).

From this it may be seen that Jena is an up-to-date town. Yet at the same time it retains more of medieval picturesqueness than most, mingling the new and the old as none but Germans know how to. "*Das liebe närrische Nest,*" as Goethe called it, is hidden away among the Thuringian hills so that the railroad was a long time finding it. The cobblestoned streets stroll out from the market place in a casual sort of a way and change their minds about where they are going without notice, twisting about Gothic churches, diving under old towers, wandering slowly along the banks of the Saale, or starting suddenly straight up hill. The gossipy gables of the old houses lean toward each other like peaked eldritch faces in fluted red caps. So close they stand sometimes that you can touch the walls on either side, and you have to walk with one foot on the sidewalk and the other on the pavement, like the absent-minded German professor who thought he had gone lame. When I saw Jena I understood something which had long puzzled me, that is, how the dachshund originated. It is manifestly a product of evolution according to the principle of the survival of the fittest, for only a creature constructed according to the specifications "dog and a half long and half a dog high" could make his way with convenience and celerity thru this maze of narrow streets. But all sorts of vehicles and beasts of burden get around somehow, too; oxen and horses, automobiles and bicycles, dog carts and women carts. Most in evidence everywhere are the students, who swagger thru the town with the consciousness of owning it, their bright colored corps caps at a cocky angle, and their faces looking like advertisements of the dangers of not using safety razors, for the Jena student has 350 years of university tradition to live up to and he realizes the responsibility of it to the full.

The ancient and honorable history of Jena is unescapable. It is woven into the very fabric of the place, and he who runs may read it from the street signs. The Volkshaus, which I have mentioned, is very appropriately approached thru Ernst Abbé Strasse and Carl Zeiss Strasse. On the other side of it is Luther Strasse, for Jena harbored the great reformer for two years at a critical period in his career. This leads to Goethe Strasse—Goethe composed the "Erlkönig" at Jena. The next turn brings us into Schiller Strasse—Schiller was professor of history in the University for ten years, carrying an active side line of poetry the while. A big stone in the old garden marks the spot where he wrote "Wallenstein," 1798. At the garden gate is Ernst Haeckel Platz, from which Ernst Haeckel Strasse leads us to our destination, the Villa Medusa. What other town could give a ten-minute walk so rich in names worth remembering?

The Villa Medusa, mind you, is not named from the Greek gorgon, but from the beautiful jelly fish with the long trail of waving threads, one of the living comets dredged up by the "Challenger," which Haeckel depicted and described thirty years ago. The house is a square-built, white, two-story dwelling, half hidden by the tall trees. The furniture is of the conventional German type. The room into which I was shown was not small, but it seemed so when Professor Haeckel entered it, for the first impression one gets is largeness. For he is a large man any way you take him; tall, heavy-limbed, large-featured; his hair is now white but thick, and his beard broad and bushy. He moves with some stiffness now, but otherwise his seventy-eight years have not impaired his vigor. His bearing is erect and his handclasp strong. His laugh is hearty and his blue eyes twinkle as he relates some amusing incident in the controversies of which his life has been full.

For Haeckel has been a storm center of the cyclonic movements that have swept over the whole earth during the last century. His name has been a battle cry in the scientific, religious and polit-

ical wars of more than one generation, and never more than at present, when a new religion with many thousands of adherents has set out to conquer the world under the sign, "There is one Substance and Haeckel is its prophet." I inferred from what he said to me and still more from what he did not say that he was not very enthusiastic over the semi-ecclesiastical form which the propaganda is now taking in Germany, but is more interested in the quieter and wider acceptance of his ideas which he regards as virtually complete in scientific circles. He disclaimed emphatically any intention of establishing a cult or ritual, like Comte.

To see Haeckel at his best one should get him to talk of his beloved Jena, which indeed is not difficult to do, for he is ever ready to speak with enthusiasm of its beauty, its freedom of thought and its leadership in many of the great intellectual movements of German history. When I remarked upon the many delightful roads and pathways upon the hills round about the town, he explained Jena was the last of the university towns to be reached by railroad. Professors and students were poor and they had to walk, so they learned to walk well and to take pleasure in outdoor exercise and to appreciate fine views. That Haeckel himself is a great lover of landscape as well as of the beautiful in all forms of life is well known to readers of his travel sketches. For this he gives credit to his mother, who, as he says in dedicating to her his "Indian Letters,"

"aroused in me in my earliest childhood a sense for the infinite beauty of nature and taught the growing boy the value of time and the joy of labor."

His skill as a draftsman and colorist appears in his zoölogical works, and besides this professional work he has in his portfolios more than a thousand original sketches in oil and water colors of scenery from Norway to Malay; in fact, of every quarter of the globe except America. When he was twenty-five he was so captivated by Sicily that he almost gave up science to adopt landscape painting as a career.

The freedom of instruction which Jena has enjoyed to an exceptional degree, even for Germany, Haeckel ascribes in part to the fact that the university is located in one of the minor states, remote from the great political centers, and derives its support from several sources. "We had four masters," said Professor Haeckel to me, "and so we remained free." He closes his address of 1892 on "Monism as the Bond Between Religion and Science" with a grateful eulogy of the Grand Duke Karl Alexander, who, he says,

"has during a prosperous reign of forty years constantly shown himself an illustrious patron of science and art; as Rector Magnificentissimus of our Thuringian university of Jena, he has always afforded his protection to its most sacred palladium—the right of free investigation and the teaching of truth."

We see that Haeckel has reason to be grateful for the protection accorded him when we realize that he first championed the cause of Darwin in 1862, only three years after the publication of "The Origin of Species," and that twenty years after that professors were being dismissed from American universities or were viewed with suspicion for believing in evolution. Even today there is probably not a university in the United States where a man of Haeckel's views on religion and his blunt way of expressing them could retain a chair. In Germany a professor may be almost anything he pleases—except a Socialist—and hold his job.

A song of the Jena students contains the couplet:

"Wer die Wahrheit kennet und saget sie nicht,
Der ist fürwahr ein erbärmlicher Wicht!"

But according to Haeckel the students of Berlin University have a different version:

"Wer die Wahrheit kennet und saget sie frei,
Der kommt in Berlin auf die Stadtvogtei!"*

The grand duchy of Saxe-Weimar-Eisenach, of which Jena is one of the chief cities, has about the same area as Rhode Island and fewer inhabitants. It was the first of the German states to acquire a constitutional government, in 1816. The community is rather rigidly orthodox in the evangelical Lutheran faith, which it was among the first to espouse. How well the Grand Duke Karl

*An undergraduate friend of mine to whom I referred these verses for translation into the vernacular of the campus gives me this version:

"Who knows the truth and speaks not out
He is indeed a sorry lout!"
"Who knows the truth and speaks too loose
In Berlin gets in the calaboose"

Alexander maintained the Jena tradition of *Lehrfreiheit* is shown by an incident that happened when Haeckel first scandalized Germany by espousing the cause of Darwinism. A prominent theologian came to the palace of the Grand Duke at Weimar and begged him to dismiss the heretic professor. Karl Alexander asked, "Do you suppose that he really believes the things he publishes?"

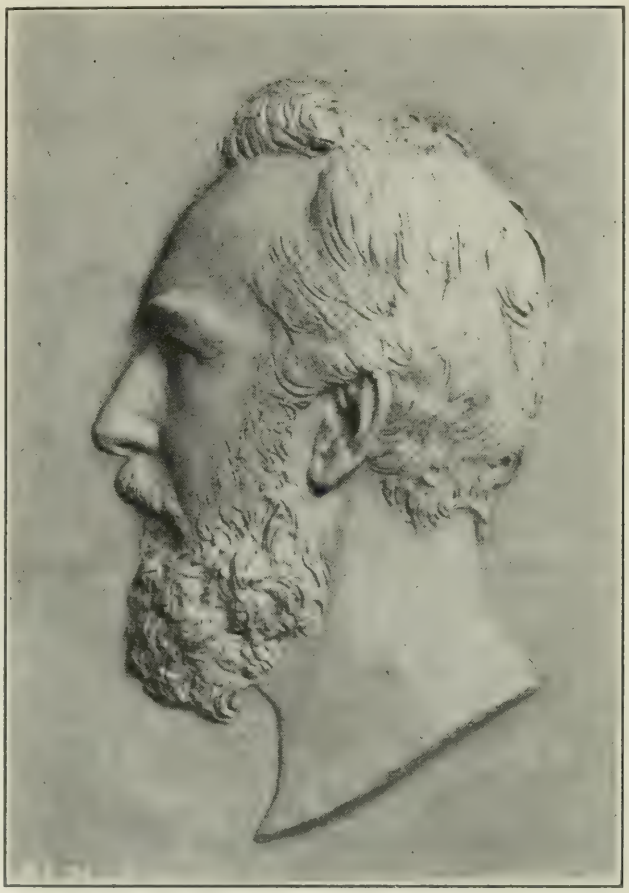
"Most certainly he does," was the prompt reply.

"Very well," said the Grand Duke, "then the man simply does the same as you do."

Nowadays, when evolution is generally accepted, when it is preached from the pulpit as well as taught in the school, it is hard for us to realize the scorn and incredulity that greeted the theory on its first formulation. We who see about us laboratories of experimental evolution where new species of plants and animals are produced at will, according to specifications drawn up in advance, can hardly put ourselves in the position of those who fifty years ago believed that to question the immutability of species was to induce intellectual confusion and invite moral chaos. So we can scarcely appreciate the courage and perspicacity of the young Haeckel in openly championing Darwinism at a time when that theory was regarded as an absurdity, not alone by theologians, as one would infer from Andrew D. White's "Warfare of Science with Theology," but by most of the leading authorities in all fields of science. But we may picture him on that memorable Sunday evening of September 19, 1863, as he rose to give the opening address of the Scientific Congress at Stettin; a tall, handsome young man, blond bearded, bright eyed, sun browned, hard working, athletic (that same year he won a laurel crown at the Leipzig festival for a record-breaking jump of 20 feet). It was certainly presumptuous in a zoölogist of only twenty-nine years, who had just secured a position in the university circle as Extraordinary Professor at Jena (which means below the Ordinary in Germany); who had just published his first book, the *Monograph on the Radiolaria,* so to attack the convictions of his elders and masters there assembled. Haeckel was no halfway man. As soon as he espoused Darwinism—which was barely a month after he had laid eyes on "The Origin of Species"—he drew from it conclusions that Darwin himself hesitated to suggest: on the one hand that life originated in inorganic matter, on the other that the human race originated from the lower animals. He at once drew up a pedigree not only of the radiolaria but of mankind. Here is a passage from the very beginning of his Stettin speech:

"As regards man himself, if we are consistent we must recognize his immediate ancestors in the ape-like mammals; earlier still in kangaroo-like marsupials; beyond these, in the secondary period, in lizard-like reptiles; and finally, at a yet earlier stage, the primary period, in lowly organized fishes."

And this, be it remembered, was eight years before Darwin published his "Descent of Man."



"Without Haeckel there would have been Darwin, but no Darwinism," says one of his enthusiastic disciples. But this immediately suggests the question of whether it was altogether an advantage to have made an "ism" out of Darwin. As a mere question of taxonomy his theory would have been regarded by the lay world as harmless and uninteresting. But heralded by Haeckel as evidential of materialism, as antagonistic to the Church and as destructive to Christianity, Darwinism raised up foes on all

A RADIOLARIAN
Lychnaspis Miranda
One of Haeckel's "Art Forms of Nature," reproduced in Bölsche's Life of Haeckel

sides who would not otherwise have concerned themselves with it. This, however, is a question of what-might-have-been like to that of whether the slaves might not have been freed without bloodshed *if* the abolitionists had not been so extreme and if the Southerners had not been so intolerant. So in this case; Haeckel was extreme, his opponents were intolerant, so the war had to be. The gentle-natured Darwin more than once had to caution his ardent German champion to be less violent and sweeping in his attacks upon those who held the older views. They were more to be pitied than blamed, said Darwin, and they could not keep back permanently the stream of truth. In England Huxley at the same time, with quite as sharp a pen as Haeckel's, was waging a similar warfare against clerical antagonists.

It may be said that Haeckel spent the rest of his life in filling in the outline he had sketched at the Stettin Congress of 1863, for however detailed the work on which he was engaged, he never afterward lost sight of the guiding clue to the labyrinth of life, evolution. We are here not concerned with the zoölogical studies on which his fame securely rests, but only with the philosophical views to which they led him. His convictions were very definitely established in early manhood and he occupies today essentially the same point of view as fifty years ago. During this time his efforts have been increasingly directed toward reaching a wider audience. In 1866 he developed the fundamental principles of his monistic philosophy in the two large volumes of his *General Morphology of Organisms*. This gained few readers outside the circle of savants and little acceptance there. In 1868 he put his theory of evolution into more popular form in *The Natural History of Creation*. This had an unusual sale for a book of its kind, but Haeckel was dissatisfied to see that the general public remained indifferent and unaffected by the new conceptions of the world and man arising from the discoveries of modern science. Worse still, he observed with alarm a rising tide of reactionary thought at the close of the century and a growing dominance of the clerical

HAECKEL IN 1890
From a relief by Kopf

power in German politics. So he determined to make a final effort to influence his generation, an appeal to the court of last resort, the Cæsar of today, the people. He packed his science and philosophy into one volume of moderate size, filled in the chinks with *obiter dicta*, and published it in 1899 under the title of *The Riddle of the Universe*. This time he hit the mark. The success of the book was immediate and amazing. An author of a detective tale or a Zenda romance might have envied him. Ten thousand copies were sold within a few months, one hundred thousand within a year, and by this time the sale of the German and English editions has doubtless passed the half million mark, not to speak of the fourteen other languages into which the book has been translated. Since a book like this usually has several readers for each copy, it is probable that those who have been directly reached by Haeckel within thirteen years must be numbered by the million. Besides this, of course, the spread of his views has been further extended by a similar volume, *The Wonders of Life*, five years

later, and by the widely circulated pamphlets of the Deutscher Monistenbund. Haeckelism, then, whatever one may think of it, is undeniably an important factor in the thought of today.

I found Professor Haeckel not altogether pleased that he owed his popular reputation to that one of his works in which he took the least pride. He seemed to hold it in almost as light esteem as his opponents and was frank in acknowledging its defects of style and content. "But," he said in substance to me, "I had set forth my philosophy with due dignity and order in my *General Morphology* more than thirty years before and nobody read it. Nobody reads it now, even when they criticise my ideas. So what could I do but put them forth in a way that would secure attention?"

We must observe that to secure this wider audience he did not resort to any of the ordinary expedients, such as palliating unpopular views, skipping dry details and avoiding technical terms. *The Riddle of the Universe* is not the sort of writing that goes by the name of "popular science" and that is commonly regarded as necessary to catch the attention and reach the understanding of the lay reader. Haeckel discusses questions of physiology, zoölogy, botany, paleontology and astronomy, each in its own tongue, the bare facts stated without any poetic disguise or flowery adornment. Far from dodging long words when necessary, he invents them when unnecessary. Few men have done so much word coinage. In his work on the radiolaria alone he had to christen more than 3,500 new species, two names apiece. So it is no wonder that when he comes to talking metaphysics and religion he sticks to the habit of making up his language as he goes.

In the case of other authors of this series I have had to distill the essence of their philosophy from the leaves of many volumes. I have had sometimes to translate poetry into prose and sometimes to piece together scattered suggestions and faint allusions into a coherent and compact doctrine. But in the case of Haeckel my task is easy, for nothing of the sort is necessary. He has himself exprest his views in succinct form and the plainest of language. He takes as much delight in creeds and dogmatic statements as any scholastic theologian, and he has the same implicit faith in formulas as capable of expressing all things in heaven and earth. One reason why his conflicts with the clergy have been so sharp and bitter is because he has much the same type of mind and uses similar language. Ordinarily, in the so-called warfare of religion and science, the adversaries revolve helplessly around one another, like double stars, without ever coming into contact.

The most convenient formulation of Haeckel's philosophy for our purpose is that which he prepared as a sort of confession of faith for his lay church, the Monistenbund. It is here translated entire and for the most part literally, tho in a somewhat condensed form.*

THE THIRTY THESES OF MONISM.

I.—Theoretical Monism.

1. Monistic Philosophy. The unitary conception of the world is based solely upon the solid ground of scientific knowledge acquired by human reason thru critical experience.

2. Empiricism. This empirical knowledge is attained partly by sense observations on the external world and partly by conscious reflection on our mental internal world.

3. Revelation. In opposition to this monistic theory of knowledge is the prevailing dualistic conception of the world, that the most profound and important truths can be gained thru supernatural or divine revelation. All such ideas are due either to obscure and uncritical dogmas or pious frauds.

4. Apriorism. Equally untenable is the assertion of Kantian metaphysics that some knowledge is acquired *a priori* independent of any experience

5. Cosmological Monism. The world is one great whole, a cosmos, ruled by fixed laws.

6. Cosmological Dualism. The idea that there are two worlds, one material or natural and the other spiritual or supernatural arises from ignorance, cloudy thinking and mystical tradition.

7. Biophysics. Biology is only a part of the all embracing physical science and living beings are under the same laws as inorganic matter.

8. Vitalism. The so-called "vital force," which is still believed by some to direct and control physical and chemical processes in the organism, is just as fictitious as a "cosmical intelligence."

9. Genesis. Organic beings and inorganic nature alike have been developed by one great process of evolution thru an unbroken chain of transformations causally connected. Part of this universal process of evolution is di-

*Thesen zur Organisation des Monismus.

rectly perceptible; its beginning and end are unknown to us.

10. Creation. The idea that a personal creator made the world out of nothing and embodied his creative thought in the form of organisms must be abandoned. Such an anthropomorphic creator exists as little as does a "moral world-order" ordained by him or a "divine providence."

11. Theory of Descent. That all existing beings are the transformed descendants of a long series of extinct organisms developed in the course of millions of years is proved by comparative anatomy, ontogeny and paleontology. This biogenetic transformation is established whether we explain it by selection, mutation or any other theory.

12. Archigony. When the earth's crust had cooled sufficiently organic life came into existence thru the katalysis of colloidal compounds of carbon and nitrogen in the form of structureless plasma globules (Monera) represented today by the Chromoceæ.

13. Plasmic Metabolism. The innumerable forms of plant and animal life arose from the ceaseless transformation of the living substance in which the most important factors are the physiological functions of variation and heredity.

14. Phylogeny. All plants and animals form a single genealogical tree rooted in the Monera.

15. Anthropogeny. The position of man in nature is now fully understood. He has all the characteristics of the vertebrates and mammals and developed out of this class in the later tertiary period.

16. Pithecoid Theory. Man is most nearly related to the tailless apes, but is not descended from any of the existing forms. On the contrary, the common ancestors of all the anthropoid apes and man are to be looked for in the earlier extinct species of old world apes (Pithecanthropus).

17. Athanism. The soul consists of the totality of cerebral functions. This soul or thought organ in man, a certain area of the cerebral cortex, acts in accordance with the same laws of psychophysics as in the other mammals. This function of course ceases at death, so it is nowadays utterly absurd to believe in "the personal immortality of the soul."

18. Indeterminism. The human will, like all other functions of the brain (sensation, imagination, ratiocination), is dependent upon the anatomy of this organ and is necessarily determined by the inherited and acquired characteristics of the individual brain. The old doctrine of "free will" is therefore seen to be untenable and must give way to the opposite doctrine of determinism.

19. God. If by this ambiguous term is understood a personal "Supreme Being," a ruler of the cosmos who, after the manner of men, thinks, loves, generates, rules, rewards, punishes, etc., such an anthropomorphic God must be relegated to the realm of the mystical fiction, no matter whether this personal God be invested with a human form or regarded as an invisible spirit or as a "gaseous vertebrate." For modern science the idea of God is tenable only so far as we recognize in this "God" the ultimate unknowable cause of things, the unconscious hypothetical "first cause of substance."

20. Law of Substance. The older chemical law of the conservation of matter (Lavoisier, 1789) and the more recent physical law of the conservation of energy (Mayer, 1842) were later (1892) by our monism united into a single great universal law for we recognized matter and energy (body and spirit) as inseparable attributes of substance (Spinoza).

II.—Practical Monism.

21. Sociology. The culture which has raised the human race high above the other animals and given it dominion over the earth depends upon the rational cooperation of men in society with a thorogoing division of labor and the mutual interdependence of the laboring classes. The biological foundations of society are already perceptible among the gregarious animals (especially the primates). Their herds and groups are kept together by the social instinct (hereditary habits).

22. Constitution and Laws. The rational arrangement of society and its regulation by laws can be attained by various forms of government, the chief object of which is a just Nomocracy, the establishment of a secular power based upon justice. The laws which limit the freedom of the citizen for the good of society should be based solely upon the national application of natural science, not upon venerable tradition (inherited habits).

23. Church and Creed. On the other hand, all means should be used to fight the hierarchy which cloaks the secular power with a spiritual mantle and makes use of the credulity of the ignorant masses to further its selfish aims. The confessional obligation as a certain form of superstition is particularly to be attacked, since it only serves to evoke the distinction between those of other beliefs. The desirable separation of Church and State is to be accomplished in such a way that the State leaves equally free all forms of belief while restricting their practical encroachments. The spiritual power (Theocracy) must always be subordinate to the secular government (Nomocracy).

24. Papistry. The strongest hierarchy which today exercises spiritual domination over the greater part of the civilized world is papistry or ultramontanism. Altho this mighty political organization stands in sharp contradiction with the original pure form of Christianity and wrongfully employs its insignia to obtain power, it nevertheless finds strong support even from its natural opponents, the secular princes. In the inevitable *Kulturkampf* against papistry it is, above all, necessary to abrogate by law its three strongest supports, the celibacy of the clergy, auricular confession and the sale of indulgences. These three dangerous and immoral institutions of the neo-Catholic Church are foreign to original Christianity. So also is the strengthening of superstitions dangerous to society thru the

cult of miracles (Lourdes, Marpingen) and of relics (Aix la Chapelle, Trèves) to be prevented by law.

25. Monistic Religion. If we understand by religion not a superstitious cult and irrational creed but the elevation of the mind thru the noblest gifts of art and science, then monism forms a "bond between religion and science" (1892). The three ideals of this rational monistic religion are truth, virtue and beauty. In all civilized states it is the duty of the representatives of the people to see that the monistic religion is officially recognized and its equal rights with other confessions assured.

26. Monistic Ethics. The rational ethics which forms a part of this monist religion is derived, according to our modern theory of evolution, from the social instincts of the higher animals, not from a dogmatic "categorical imperative" (Kant). Like all of the higher gregarious animals man strives to attain the natural equilibrium between the two different obligations, the behest of egoism and the behest of altruism. The ethical principle or the "Golden Rule" has exprest this double obligation 2,500 years ago in the maxim: "Do unto others as you would that they should do unto you."

27. Monistic Schools. In most civilized countries, and especially in Germany, the instruction of youth in upper and lower grades is still largely bound in fetters which the scholastic tradition of the Middle Ages has retained to the present day. Only the complete separation of Church and school can loose these fetters. The prevailing confessional or dogmatic religious instruction is to be replaced by comparative religious history and monistic ethics. The influence of the clergy of any confession is to be removed from the school. The inevitable school reform must be accomplished upon the basis of modern natural science. The greater part of education should be devoted, not to the study of the classical language and history, but to the various branches of natural science, especially anthropology and evolution.

28. Monistic Education. Since the sound development of the soul (as a function of the cerebral cortex) is closely connected with that of the rest of the organism, the monistic education of youth, free from the dogmatic teachings of the Church, must strive to upbuild soul and body equally from earliest youth. Daily gymnastics, baths and exercises, walks and tours, must develop and strengthen the organism from early youth. Observation and love of nature will be thus awakened and intensified. Thru public libraries, continuation schools and popular monistic lectures will the more advanced be provided with mental nourishment.

29. Monistic Culture. The admirable hight of culture which mankind in the nineteenth century has attained, the astonishing progress of science and its practical applications in technology, industry, medicine, etc., gives grounds for expecting a still greater development of culture in the twentieth century. This desirable progress will then however be possible only if the beaten paths of the traditional dogmas and of clerical superstition

THE PHYLETIC MUSEUM, JENA
Planned by Haeckel to contain collections illustrating evolution

be abandoned and a rational monistic knowledge of nature attain the mastery instead.

30. The *Monisten-Bund*. In order to spread the natural unitary theory of the universe to the widest circles and to realize practically the beneficent fruits of theoretical monism it is desirable that all efforts in this direction find a common point of application thru the founding of individual monist societies. In this universal monist association not only all free thinkers and all adherents of the monistic philosophy find place but also free congregations, ethical societies and free religious associations, etc., which recognize pure reason as the only rule of their thought and action and not belief in traditional dogma and pretended revelations.

There is a strong resemblance in form between this creed of the monistic religion and the creeds that have been formulated by many other religions in the history of the world; the same juxtaposition of cosmogony and ethics without any apparent connection; the same mixture of the fundamental and trivial, the permanent and ephemeral; the same affirmation of idealistic aims mingled with attacks upon what is assumed to be the beliefs of the opposition.

It is not my purpose in these papers to criticise the views I present or to obtrude my personal opinions, so I shall not discuss this monistic confession of faith except to point out the striking contrast between the theoretical and practical sections of the statement. The second is in no sense a deduction from the first and they are so different in character as to give the effect of an anticlimax. Haeckel's fundamental principles are bold and revolutionary. His practical conclusions are timid and conventional. It would be a dull faculty meeting which did not bring out more heretical views on education than Haeckel expresses. Why is it necessary to storm the battlements of heaven and create a new earth in order to make Greek optional and get the students to take baths and walks?* Any session of the American Sociological Society will bring out more suggestions for the radical reorganization of society from professors in good and regular standing than are to be found in all of Haeckel's works. He seems blind to what would appear to us the glaring evils of his country, the burden of militarism, the oppression of government, the conflict of classes, the monopoly of land, the injustice of hereditary rank, the superstition of royalty, and the like. If he touches on these at all it is in mild and cautious terms. All his fury is directed against the Church, Protestant and Catholic alike, yet he remained until the age of seventy-seven a member of the orthodox Lutheran Church.

The reforms he advocates in social customs are for the most part very moderate. He is himself no smoker, and he thinks that the German students devote too much attention to beer and dueling. This is sensible but not startling. He declaims against the tyranny of fashion and denounces corsets as injurious to the health.* In this, however, most men and not a few women would agree with him. He asserts that marriage is not a sacrament, but a civil contract, and as such may be dissolved.† This is a doctrine common to Hebrew and Puritan. One of the chief objects of the founding of the Monistenbund was to force the separation of Church and State and the secularization of the schools. This seems so obviously just and desirable that it is hard for us to realize on what grounds it should be opposed. And as for the demands exprest in Article 25 it is almost inconceivable to us that a government could refuse a man the right to declare himself a Monist, instead of a Lutheran or a Hebrew, if he wants to.

It would, however, be an injustice to Haeckel to assume that, because such things seem trite and timid to us, that they do not require perspicacity and courage in Germany. The fact is that Germany, advanced tho it be intellectually, is still medieval in government and usages. If, for instance, a German clergyman should visit this country and stay in the home of an American minister, the latter would probably be distrest by the views held by the visitor on the inerrancy of the Scriptures and the value of beer, while, on the other hand, the German would be equally shocked to hear his reverend friend advocate secular schools and ridicule the divine right of kings.

Haeckel practically takes over intact the fundamental principles of Christian

*"Riddle of the Universe," p. 393.

†"Wonders of Life," p. 430.

‡"Wonders of Life," p. 428.

ethics, making the Golden Rule the basis of his system, altho characteristically refusing to give Jesus any credit for it by saying that it had a "polyphyletic origin." He attacks, indeed, certain extreme forms of it, asceticism, belittlement of family life, absolute self-sacrifice, etc., but he adopts substantially the moral standards which the Christian men of his time and environment profess and endeavor to practice. I do not say that he is wrong to borrow ethics from Christianity. I do not suppose he could do better. But he would have done the world great service if, instead of taking a ready-made ethical system, he had worked it out from his fundamental principle of evolution, as Spencer, Drummond and Kropotkin have tried to do. If, having done this, he had arrived at the same conclusions as the Christian moralists, his aid would have been invaluable just now, when, almost for the first time, attacks are made not so much on the theology as on the ethics of Christianity, and this, too, in the name of science. The air is filled with questions which arise in Haeckel's peculiar field. Is, for example, Nietzsche justified in preaching ruthless egoism as the logical lesson of evolution? Or is it true, as many now say, that the preservation and protection of the weak in body and mind necessarily leads to the degeneration of the race? In the incidential references he makes to these questions,* he condemns Nietzsche, but advocates euthanasia for the hopelessly diseased, reaching the first conclusion from his "own personal opinion" and the second from "pure reason." As the individual views of an evolutionist these are interesting and even valuable, but they can hardly be regarded as established principles of the science of evolutionary ethics.

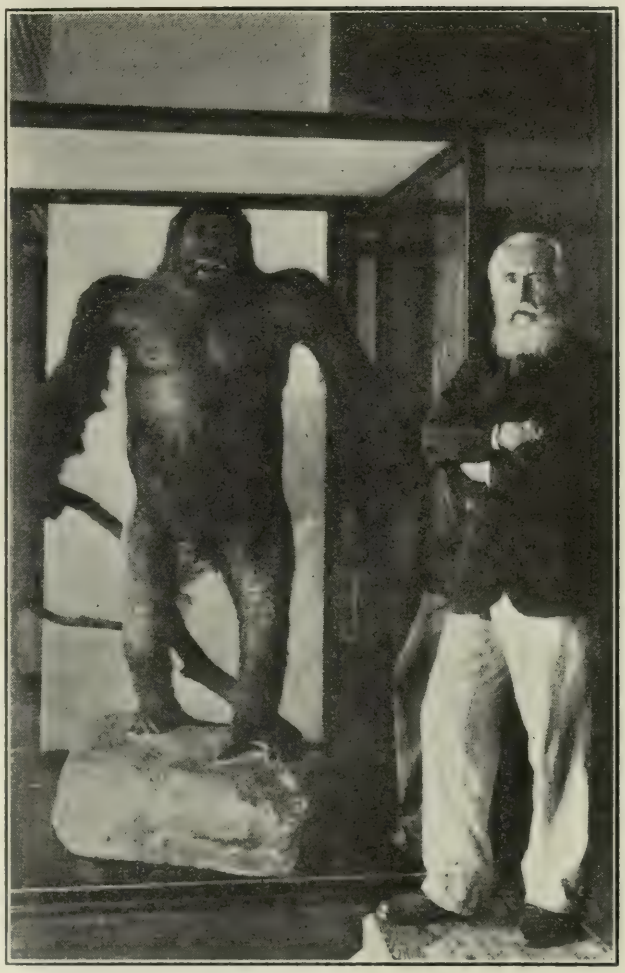
Haeckel's politics may be summed up by saying that he is anti-clerical and not much else. He concerns himself little about the form of government or economic conditions, regarding them indeed as comparatively unimportant matters.

The monistic and the socialistic movements in Germany are closely associated, but chiefly, it seems to me, because both are anti-clerical rather than because the evolutionary philosophy necessarily leads to either democracy or socialism. Many Social Democrats profess themselves Monists, and doubtless a large proportion of that party would agree with Haeckel in the matter of religion. But on the other hand, they can derive little if any support for their doctrines from the Monistic literature. Haeckel states his opinion with his usual frankness in a contribution to Maximilian Harden's magazine, which concludes with the words:

> "I am certainly no friend of Herr Bebel, who has attacked me repeatedly, and among other things has slandered me in his book on Woman. Besides, I hold the utopian aims of the official social democracy to be impracticable and its ideal future state to be a big workhouse. That, however, cannot prevent me from recognizing the kernel of justice in the great social movement. That this can be overcome by the repressive acts of the Berlin council, by the power of the police and of the State prosecutors, can be believed only by one who knows neither the history nor the natural history of mankind."—*Zukunft*, 1895, No. 18. Quoted in the introduction to *Freie Wissenschaft und freie Lehre*, p. 9.

The immense popularity of *The Riddle of the Universe* is, I think, largely to be accounted for by the personality of the author. The man behind the gun was what gave it power. I do not mean that the reception given to the book was due to Haeckel's standing as a zoölogist. The outside world knows little and cares less for scientific reputation. It was rather that the book revealed a man tremendously in earnest who had made up his mind on questions of the most vital interest to all and who said what he thought in the plainest and most emphatic language, without regard to whose feelings he hurt. *The Riddle of the Universe* and *The Wonders of Life* are, it seems to me, more valuable as contributions to the psychology of genius than to philosophy. The personal interest he aroused is evinced by the thousands of letters he received and is still receiving about these books, ranging in tone from the warmly sympathetic to the furiously antagonistic. He years ago had to give up the task of answering them save by a printed slip.

Few books have ever excited so much heated controversy. Hundreds of criticisms and replies have been published, and new ones appear frequently yet, twelve years after. The book was in-



*Wonders of Life, pp. 115 and 119.

tended to draw the fire of the enemy, clericalism, and it did. Nor did the philosophy of the chair receive it any more favorably. It will be sufficient on this point to quote the sharp criticism of Prof. Friedrich Paulsen, of Berlin University, whose idealistic monism comes into direct conflict with Haeckel's materialistic monism:

"I have read this book with burning shame for the state of general culture and the philosophical culture of our people. That such a book was possible, that it could be written, printed, sold, read, admired, believed by a people which claims a Kant, a Goethe, a Schopenhauer, is painful."

It is one of the curiosities of controversy that the Church should often be found defending with desperation, not her own positions, but some of the old, abandoned redoubts of Science. This was largely the case in the evolution controversy. The "origin of species" was in the scientific mind. It was Science that discovered that all the multifarious forms of plant and animal life could be classified into distinct types, which, it too hastily assumed, were absolutely separate and fixed. When later Science came to revise that view, it discovered that the immutability of species had somehow in the meantime become a theological dogma, to be zealously defended by curates who could not tell a species from a genus.

It was the same in regard to the theory of spontaneous generation or the production of living beings from non-living matter. This was formerly good Christian doctrine, accepted by St. Augustine and taught by the medieval schoolmen, and when in 1674 the Italian physician, Francisco Redi, showed that the maggots that appeared in dead matter came from eggs he was persecuted for unbelief. But it was still maintained that microscopic living forms could arise spontaneously in bouillon and infusions of hay until Pasteur proved that this was false, for in sealed and sterilized tubes no trace of life appears. Such negative experiments are, of course, not competent to prove that at some time and under other conditions life might not be produced from the non-living. Yet, strangely enough, Haeckel's theological opponents voluntarily adopted this untenable position and waged war against

PROFESSOR HAECKEL STANDING BESIDE THE GIANT GORILLA IN THE PHYLETIC MUSEUM, JENA

him especially on account of his belief that when the earth's crust cooled down, compounds of cyanic acid were transformed into globules of albumin, from which developed unicellular organisms. In more than one laboratory experiments in the generation of life are being hopefully carried on, and an announcement of their success at any time would not amaze biologists in general. But even tho abiogenesis should forever remain impossible as a laboratory experiment, it would not be untenable as a hypothesis of the origin of life under the exceptional conditions of some earlier stage in the world's history. Such a supposition, whether true or not, is at least no more irreligious than is a recognition of the fact that non-living matter is being continuously transformed into living within our own bodies.

The volume invited attack because it was not only intentionally provocative, but unintentionally vulnerable. One does not have to be very learned in order to

discover in it occasional errors as well as many extravagant and questionable statements. The fact that few people could treat of such a wide range of topics without making more mistakes than Haeckel did not, of course, protect him from criticism. Huxley, who enjoyed crossing swords with the clergy as much as Haeckel, was more careful to guard himself from counter attack. If a discussion of demonology led unexpectedly to the question of the exact status of the district of Gadara in the Roman Empire, he was prepared to meet his opponents on that ground as well as in biology. Not so Haeckel. He picks up his church history from infidel pamphleteers* and recklessly caricatures Christian beliefs.

In attacking the dogma of the Immaculate Conception of Mary he confuses it with that of the Virgin Birth of Christ, and at the same time uses language needlessly offensive to those who regard the Mother of Jesus with adoration.†

A more serious charge than ignorance of ecclesiastical history was later brought against Haeckel by Dr. Brass, namely, that he had fabricated evidence in support of his theory of evolution by falsifying his drawings of embryos, that he had, among other things, taken away vertebræ from the tail of a monkey embryo and had extended the backbone of a human embryo in order to enhance the resemblance. Since accuracy is the soul of science this is as serious as it would be, for instance, to charge a minister with preaching miracles when he does not believe in them. In his reply Haeckel acknowledged

"that a small part of my numerous embryo pictures (perhaps six or eight per cent.) are actually 'falsified' (in the sense of Doctor Brass), all those in fact in which the material at hand for observation was so incomplete or unsatisfactory that one was forced to fill up the gaps by hypothesis and to reconstruct the missing members by comparative synthesis in order to produce a connected chain of evolution."

Haeckel emphatically denies any deception or misrepresentation, and calls attention to the fact that such diagrammatic and reconstructed drawings are common to all physiological works and are necessary to bring out the desired points. As to whether Haeckel has transgrest the permissible limits of such schematization of material I should not be competent to decide. Thirty-six German men of science signed a condemnation of Haeckel; forty-seven German men of science, "tho they did not like the kind of schematizing which Haeckel practised in some cases," signed a condemnation of Brass and the Keplerbund. The numbers have no significance, since majorities never decide anything but balance of opinion.

This whole affair is a striking illustration of Huxley's observation that a controversy always shows an unfortunate tendency to slip from the question of what is right to the relatively unimportant question of who is right. Haeckel's critics have rarely attempted to controvert his scientific work and in fact would not in most cases be competent to discuss it. Even if he were guilty of all the mistakes alleged it would not materially affect his scientific conclusions.

In noting Haeckel's faults we are in danger of failing to appreciate the marvelous constructive genius of the man; the creative imagination which is characteristic of the great scientist even more than of the great poet. It was this gift that enabled him to discern in a handful of slime dredged up by the "Challenger" from the depths of the sea an orderly system of living beings wherein each microscopic skeleton of silica found its natural niche. It was this power which enabled him to assist so largely in the transformation of zoölogy from a purely observative and descriptive science, as it was when he began his labors, to a rational, experimental and prophetic science, as it was when he closed them. As Cuvier from a few bits of bone could construct a whole animal, so Haeckel from scattered species ventured to construct, as early as 1865, a family tree, including all living forms from monera to man. Faulty it is from the standpoint of our present knowledge, but yet it must command our admiration because of the insight he showed in perceiving natural relationships and the skill with which he bridged the gaps in his living chain by hypothetical forms. Just as the great Russian chemist Mendeléef was able to describe in advance elements then un-

*President Thomas, of Middlebury College, exposed the source of his theory that the father of Christ was a Roman officer named Pandera in THE INDEPENDENT, Vol. 64, p. 515.

†Some of the more offensive of these passages are modified or eliminated in the later editions of *Die Welträtsel.*

known, but which were discovered later and found to fit into the vacant places he had assigned to them in his periodic law, so Haeckel's anticipations have been in many cases confirmed by later science. It was his good fortune to be able to hold in his hand the skullcap and femur of the "missing link" which had for years been the jest of the anti-evolutionists. The ape-man or Pithecanthropus, which he had in 1885 described and named, was in 1894 discovered by Dubois in Java. The mind of Haeckel has such high tension that it leaps over the gaps in a demonstration like a 10,000 volt current.

Ernst Heinrich Philipp August Haeckel, to give him for once his full baptismal name, was born in Potsdam, February 16, 1834. He has a double inheritance of talent, for both the Haeckels and the Sethes, his mother's family, have contributed prominent names to German history, and the two families have intermarried more than once. It is a curious fact that Gustav Freytag, in his series of "Pictures from the German Past," should have chosen for his representative men of the nineteenth century two of Haeckel's ancestors: his mother's father, Christophe Sethe, Privy Councillor and defender of Prussia against Napoleon, and his father, Karl Haeckel, State Councillor.

But Ernst did not follow the family tradition and take to the law. He showed an unmistakable bent for natural science, so, as a compromise profession, his father had him trained as a physician. He took the medical course, and in obedience to his father's wishes consented to practice the profession for a year to see if he could make a success of it. During the year only three patients came to him, owing perhaps to the fact that Haeckel in order to get time for his biological researches had fixed his consultation hours from five to six in the morning. His father then gave up trying to make a doctor out of him and allowed him to go to Messina in 1859 to study marine animals. Haeckel straightway became engaged to his cousin Anna Sethe and as soon as he got his appointment at Jena married her. Their happiness was brief. Two years later she died, leaving Haeckel, then 30, so stricken that he felt that he could not long survive the blow, so he plunged with feverish haste into the preparation of his *General Morphology* in order to leave to the world his science and philosophy in a systematic form. It was written and printed, two thick volumes of more than 1,200 pages, in less than a year, during which Haeckel lived like a hermit, working all day long and half the night, getting barely three or four hours sleep out of the twenty-four.

Haeckel immortalized his wife by giving her a living monument instead of one of marble or brass. He named for her one of his beloved medusæ, a fairy-like jelly-fish whose mass of long trailing tentacles reminded him of his wife's blond hair. The Mitrocoma Annæ is described in his *Monograph on the Medusæ*, published in 1864, and a note states that it was so named*

"in memory of my dear, never-to-be-forgotten wife, Anna Sethe. If it is given to me to do something during my earthly pilgrimage for science and humanity, I owe it for the most part to the blessed influence of my gifted wife, who was torn from me by a premature end in 1864."

Thirty-three years later he married again, Agnes Huschke, daughter of a Jena anatomist. They have three children, two daughters and a son who has inherited his father's artistic talent and has devoted himself to art in Munich.

Haeckel's esthetic taste is shown not merely in the thousands of paintings and drawings that fill his monographs but especially in his *Art Forms of Nature*, which consists of ten portfolios of large color plates depicting strange and beautiful creatures from all realms of animal life but particularly in little known lower forms, fishes, crustaceans, corals, radiolaria, diatoms and desmids. Here are to be found real gargoyles, more grotesque than a sculptor's unaided imagination can create. Here the designer and decorator can find hundreds of suggestive themes for almost any purpose.

A large part of these "art forms" Haeckel discovered in the course of his investigations of deep-sea life on the material gathered by the "Challenger," which was commissioned by the British Government in 1872-75 to explore the ocean. The results of this expedition, published in fifty large volumes, consti-

*Another medusa also named for his wife, Desmoniena Annasethe, will be found on one of the color plates of the New International Encyclopedia (Vol. 12, p. 68).

tuted the greatest contribution to oceanography that has ever been made. Haeckel contributed the volumes on the medusæ, the siphonophora, the keratosa and the radiolaria. To the radiolaria Haeckel devoted ten years, 1877-87, and described 4,318 species and 739 genera, from the curiously complicated siliceous skeletons deposited on the bottom of the ocean by these minute one-celled creatures.

Altho Haeckel's life was largely devoted to the closest study of the minutest forms of life yet he never lost sight of the broader aspects of his science. It seems as tho he felt the need of resting his eyes by raising them from the microscope and looking out of the window to focus on infinity. Haeckel is essentially a specialist with a fondness for generalization. He welcomed the change in the current of thought that set in at the close of the nineteenth century, the effort of the new century to get at the inner meaning of the mass of miscellaneous facts that the old century had heaped up. It was with intent to assist in this movement that he produced, at the age of sixty-five, his *Riddle of the Universe*, intending this to be the final expression of his view of the world, a fragmentary sketch instead of the complete "System of Monistic Philosophy" which he had projected many years ago and could not now hope to complete. But five years later he supplemented this with a similar popular volume, *The Wonders of Life*, in which he replies to certain criticisms and explains the biological principles on which his philosophy is based. This, unlike the *Riddle*, was not composed at various intervals in the course of many years but was written uninterruptedly during four months spent at Rapallo, on the Italian Riviera, when he was

"stimulated by the constant sight of the blue Mediterranean, the countless inhabitants of which had, for fifty years, afforded such ample material for my biological studies; and my solitary walks in the wild gorges of the Ligurian Apennines and the moving spectacle of its forest-crowned altars, inspired me with a feeling of the unity of living nature—a feeling that only too easily fades away in the study of detail in the laboratory."

Professor Haeckel retired from active service as teacher and investigator in 1909 at the age of 75. "Indeed I am wholly a child of the nineteenth century and with its close I draw the line under my life's work," he said, and the publication of *The Wonders of Life* in 1904 confirms rather than contradicts this, for it shows that he maintains his position altogether unshaken by the revolution that has taken place in philosophic thought. Like Herbert Spencer he lived to see a reaction against many of the opinions for which he fought most earnestly.

The nineteenth century was cocksure of so many things about which the twentieth century doubts. We are not so certain that, as Haeckel says, everything can be reduced to the motion of the atoms. The atom itself is crumbling and as for motion, what is it? The ether in the reality of which Haeckel puts implicit faith is to us a doubtful, perhaps an unnecessary hypothesis. Vitalism and teleology are coming back again into biology in new forms. Pluralism, not monism, is the fashion of the day and some carry it almost to polytheism. Indeterminism finds more advocates nowadays than determinism. Haeckel makes the first law of thermodynamics (conservation of energy) one of the corner stones of his philosophy but has little regard for the second (degradation of energy). Modern thought considers the second law more important than the first.*

And what shall we say about the "Law of Substance," which is Haeckel's contribution to the fundamental principles and which he apparently regards as of equal importance to the discoveries of Lavoisier and Mayer.† Speaking for myself, the reason I cannot accept it is because it is absolutely meaningless to me. We know what the law of the conservation of matter means. It means, among other things, that 12 pounds of carbon when burned make 44 pounds of carbon dioxid, which we may decompose and get back 12 pounds of carbon again. The law of the conservation of energy means, among other things, that when we burn 12 pounds of carbon we produce 135,305,600 foot-pounds of energy. But what does it mean when we say that

*The significance of this change of emphasis in its bearing on metaphysical, religious and ethical ideas I endeavored to explain in the preceding article of this series (Ostwald, in THE INDEPENDENT of May 2, 1912).

†See No. 20 of the thirty theses given above.

matter and energy, or body and spirit, are somehow the same substance? Even if true, does it make a bit of difference to anybody or anything; or to put the query into the pragmatic form, can it be true if it does not make a bit of difference to anybody or anything? But we must bear in mind that the rigid application of this formula to many famous attempts to solve the "riddle of the universe" would leave less of them intact than in the case of Haeckel.

The Christian reader is likely, in his irritation at what appears to be wilful misrepresentation of his beliefs, to be too sweeping in his condemnation of the ideas of Haeckel. Even in the matter of religion Haeckel is not nearly so heretical as he assumes or is presumed to be. Many of the things he attacks are almost unrecognizable caricatures of modern religious views. It should be remembered that the *Riddle* and the *Wonders* were written at a time when he saw the German Government coming under the domination of the Blue-Black Block, and when it seemed to him that this coalition of conservatives and clericals threatened to suppress free speech and to check the advance of science. In his earlier writings his views are exprest in much more conciliatory language. Indeed, his pantheism is hardly distinguishable at times from theories of divine immanence such as are now held very commonly in orthodox churches. Wherein lies the magic of the word "monism" if not in our ingrained prejudice in favor of unity, inherited from the fierce monotheism of the Jews? Is not Haeckel then borrowing the thunders of Sinai to enforce his new religion?

How To Read Haeckel.

The Riddle of the Universe (Harper; $1.50) is the best popular presentation of science and philosophy from Haeckel's point of view. This may be supplemented by *The Wonders of Life* (Harper; $1.50), in which he develops more fully the biological side and defends himself against certain criticisms. To these should be added the very interesting life of Haeckel by W. Bölsche (Jacobs; $4). Cheap editions of these three are published by the Rationalist Press Association, London, at sixpence. They, as well as other works of Haeckel, are translated by Joseph McCabe, who was trained as a Catholic priest but now devotes himself to anticlerical propaganda.

The Natural History of Creation (Appleton; $5) and *The Evolution of Man* (Appleton or Putnam; $5) are both intended to explain in a way comprehensible to the general reader the fundamental principles of the theory of evolution and the biological facts on which it is based. Special addresses by Haeckel are translated under the titles of: *Monism as Connecting Religion and Science* (Macmillan; 80 cents) and *Last Words on Evolution* (New York: Eckler; $1). Of his *Indische Reisebilder* there are two versions in English; one by Mrs. S. E. Boggs entitled "India and Ceylon," which is neither literal nor complete, and one by Clara Bell, "A Visit to Ceylon" (Eckler; $1), which is better. An article by Haeckel on "Psyche" was printed in The Independent, September 21, 1911. On the personal side may be read Herman Schauffauer's sketches, "Haeckel, a Colossus of Science" (*North American Review*, August, 1910), and "A Talk with Haeckel at Home," in *T. P's Magazine*, 1912; Elbert Hubbard's "Little Journeys to the Homes of Great Scientists," and Joseph McCabe's "A Scientist's Sunset Years," in *Harper's Weekly*, August 7, 1909. A few of the more noteworthy of the books and articles on Haeckelism in English are: "Life and Matter," by Sir Oliver Lodge, a criticism from the standpoint of a spiritualist; the discussion between Lodge and McCabe in *Hibbert Journal*, Vol. III, pp. 315 and 741; "The World View of a Scientist," by Frank Thilly in *Popular Science Monthly*, Vol. LXI, pp. 407-425; "Ernst Haeckel, Darwinist, Monist," by V. L. Kellogg, in *Popular Science Monthly*, Vol. LXXVI, pp. 136-142; "Haeckel and Monism," by J. Butler Burke, in *Oxford and Cambridge Review*, 1907; "Lucretius and Haeckel," by F. B. R. Hellems, in *University of Colorado Studies*, Vol. III, 1905; "Religion as a Credible Doctrine," by W. H. Mallock; "Haeckel's Monism False," by Rev. F. Ballard; "The Old Riddle and the Newest Answer," by Father Gerard: "Haeckel's Critics Answered," by Joseph McCabe (London: Rationalist Press): "Haeckel's Answer to the Jesuits" (New York: *Truthseeker*); "Haeckel and His Methods," by R. L. Mangan, in the *Catholic World*, May, 1909. The monism of Dr. Paul Carus, of Chicago, is a different variety from Haeckel's as he has pointed out in the *Monist*, Vol. II, p. 498; Vol. IV, p. 228, and Vol. XVI, p. 120.

Of the immense body of literature in German on Haeckel it is impossible to give space even to titles. The bibliography appended to *Ernst Haeckel: Versuch einer Chronik seines Lebens und Wirkens*, by Walther May (Leipzig: Barth, 1909), devotes 14 pages to the titles of Haeckel's writings, 4 pages to a list of biographical books and sketches, and 13 pages to a list of criticisms and discussions of Haeckelism.

Die Welträtsel and *Die Lebenswunder* are published by Alfred Kröner, Leipzig, at 8 marks each, or 1 mark for the popular editions. The monistic movement may be followed by the pamphlets of the society, which may be obtained, at 50 Pf. ordinarily, from the *Verlag des Deutschen Monistenbundes*, Berlin, W. 57.

New York City.

Sleeping in the Open

BY ROBERT H. VAN COURT

ONE of the encouraging signs of the times is found in the revival of interest in country living and in the increased zest in every form of outdoor activity which has seized upon the American people during the past fifteen or twenty years. This love of life in the open and the sports and pastimes which it makes possible has become part and parcel of our national life, and is shared everywhere by people of all ages and classes.

It is but natural, therefore, to find that our new attitude toward this important phase of life has influenced our habits of living and consequently the planning and arrangement of our homes. Fresh air and sunshine, which our grandparents strove so earnestly to exclude from the house, are now regarded as vitally necessary, and our homes are being built to provide the maximum amount of sunlight during as many hours of the day as possible. One would almost as soon think of planning a home without heating apparatus as of arranging living rooms or bedrooms without cross current ventilation, which means the placing of windows or outer openings to make possible a constantly moving current of fresh and uncontaminated air.

This new appreciation of fresh air and a wider knowledge of the benefits of proper ventilation have very naturally led to the desire of securing more of it, and everywhere the custom of sleeping with windows at least partially open during the entire year is finding acceptance. Camping and summer life in the woods, where sleeping must perforce be more or less in the open, first demonstrated the healthfulness of the practice of sleeping out of doors, and has led to its being adopted to a great extent in permanent homes, for who would willingly sleep in a stuffy and poorly ventilated bedroom during the warm nights of an American summer with recollections still green in memory of other nights spent in the cool freshness of the open air?

Then, again, the benefits of open-air sleeping have long been urged by physicians who insisted that their patients inhale, during their sleeping hours, even in winter, the dry air of Colorado or the balsam-scented air of the Adirondacks, and it is but logical to suppose that if this treatment be efficacious in making the weak strong it may also be the means of making the strong more healthy and vigorous. It is said that in one city of Colorado, noted particularly for its delightful climate, almost one-half of the homes are provided with some form of open-air sleeping arrangements, many of which are in use during the greater part of the year. The sleeping porch or veranda, or the same thing called by another name, has everywhere become a really recognized institution, regarded no longer as a fad or an innovation, but almost as necessary as a system for lighting or heating, particularly if the home be in the country or in even a semi-suburban locality.

The originators of any custom are called upon to do considerable missionary work before their tenets obtain any wide acceptance, and this is particularly true of those hardy and adventurous souls who first proposed and actually put into practice so daring and startling an innovation as the actual sleeping in the open air. Consumption was prophesied, or that pneumonia or diphtheria would surely be their reward, but when those who put their theories into consistent practice were found to be in better health and strength and more robust than ever, the custom met with a grudging acceptance, and after a time made many converts. The missionary days of out-of-door sleeping have now, however, passed away; the idea has come into its own, and the sleeping porch is accorded a welcome and honored place in the country or suburban home, as will be seen if one examines any of the books or magazines dealing with the planning, building or furnishing of the modern home. Its utility is recognized and its use estab-

lished and in every part of the country its benefits are being extolled—and they are legion. The objection is sometimes made that open-air sleeping rooms are ugly and awkward in appearance, and that their use is apt to upset the carefully planned dignity and balance which is so important a consideration in the building of the home. These sleeping verandas are generally in the form of upstairs porches, usually semi-enclosed, and there is no reason why their use should not add to rather than detract from the appearance of the exterior. This can often be done by placing the sleeping porch directly over the first floor veranda, and by treating it as a part of the building itself rather than as an

A BED MOUNTED UPON WHEELS IS EASILY MOVED TO THE SLEEPING PORCH

In this illustration is shown an out-of-door sleeping room leading from an indoor sleeping room in a house at Salem, Mass., over the lower story veranda. This sleeping room is inclosed with wire netting and canvas.

HOW TO SLEEP IN THE CATSKILLS
This log cabin is built with a veranda for general lounging and an upper porch for sleeping purposes

addition tacked on as an afterthought. These two porches may be planned as a wing and given an architectural dignity highly becoming their importance as so necessary a part of the house. The verandas, upper and lower, should be carefully placed where they will have a southern exposure or where they will catch the prevailing breezes, and the sleeping porch might be so planned that it may be reached from at least two bedrooms by windows extending to the floor. Its exterior may be arranged to agree with the character of the rest of the house, and in a way to emphasize its dignity, for there is no end to the ingenuity and variety of good taste or to its expression in the arrangement of such domestic utilities. An upstairs porch may be easily made into the most comfortable and inviting of open-air bedrooms. Curtains or movable screens may be arranged as protection against drafts, or glass panels may enclose the porch, and be opened as much or as little as one may desire. Wire screens or frames covered with mosquito netting are easily fitted into place if their use is required. The furnishings of such a sleeping veranda are, of course, quite simple, being confined chiefly to beds either of iron or else of wire-covered cots, covered with thin mattresses. A chair or two is generally in order, with perhaps a rug upon the floor at the bedside. Even a really enthusiastic out-of-door sleeper will want to undress and dress in a heated room if his love for the open air be strong enough to prompt his use of the sleeping balcony during the cold months of winter, and in planning such an arrangement it should be made to open from a bedroom. A family of children enjoy an arrangement for out-of-door sleeping which is practical and ingenious and yet exceedingly inexpensive. The room which serves as their nursery connects by a wide French window with a balcony which is so screened with glass that it may be entirely or par-

THE SLEEPING BALCONY IS AS ESSENTIAL IN MODERN HOUSE MAKING AS THE VERANDA
Here the balcony shown is on the left, opening from a bedroom and placed where it catches all the breezes from three directions

tially opened to the air. The window is made without the usual sill, and as the little beds are upon wheels, the children are undrest before the nursery fire, tucked snugly into their beds, covered with the lightest and yet the warmest of eiderdown quilts, and then wheeled out into the open air. As this practice is continued the entire year, their nurse has been known to find their beds covered with snow in the morning. Their neighbors have threatened to report the case to the Society for the Prevention of Cruelty to Children, but the boys and girls themselves delight in it, their parents strongly advocate it, and the sturdy growth and perfect health and strength of the children themselves are the most potent answer to the criticisms of neighbors, some of whom are now beginning to adopt open-air sleeping themselves.

In many city homes use is made of flat roof surfaces upon which to plan the most fascinating of roof gardens, which are also sometimes used as open-air sleeping rooms. In a certain old-fashioned quarter of downtown New York is a house where, in the upper story, a young artist has his studio. The floor below possesses an extension so that a flat roof some 20 by 30 feet lay just outside his studio windows. Wonderful opportunity for a roof garden, particularly as the roof is almost covered by the overhanging boughs of a huge tree which has managed somehow to escape destruction! A floor of light slats was laid to protect the roof of tin, the garden made beautiful with jardinieres of growing plants, and a hedge of privit, which is grown in a number of long, narrow boxes and which surrounds the roof garden. Hammocks, wicker chairs and other out-of-door furnishings are used, and rugs and cushions add to the beauty and interest of the place. In the evening dinner is served upon the roof and here the family may linger amid the

RAISING THE ROOF HAS GREATLY IMPROVED THE APPEARANCE OF THIS HOUSE
Furthermore it has made practicable a spacious open-air sleeping room. The house shown in this illustration stands at Garden City, Long Island.

shrubbery and flowers. The roof garden later on becomes an open-air bedroom, where, under an awning, or merely under the branches of the old elm, much of the peace and comfort of rural out-of-doors is enjoyed within a stone's throw of roadway and not far from the "Sixth Avenue Elevated." The success of this roof garden and its usefulness as a sleeping place may have inspired a more modest but quite successful arrangement in a suburb of Boston. Here was a flat roof about 5 by 10 which covered a bay window and which is just

outside the window of a living room. As the house is merely rented it seemed unwise to incur any undue expense in converting the space into any but the simplest of breathing places, but ingenuity and good taste have produced very interesting results at a very small expenditure of dollars and cents. A very simple railing was placed about the roof, a floor of wooden slats was laid and an awning was put in place, so arranged that it may be easily lowered or raised. The little retreat, which is very attractive with a few vines and plants, is beloved by its owners, for it supplies a tiny but comfortble lounging place during the day and an open-air sleeping room at night.

In still another suburban home an open-air "dormitory" has been secured. In planning the house the architect merely provided for raising the roof some 8 or 10 feet higher than the level upon which it would ordinarily have been built, and has planned, as supports, piers which are covered with the shingles of which the house itself is built. The result is a decided improvement in the exterior of the house and the most delightful of open-air rooms, which, as it extends over the greater part of the house, is of unusual size. Being shaded from the sun during the day and yet open upon all sides, it is generally cool, and it affords a view over a particularly beautiful stretch of suburban country. During the day it fulfils various functions as a playground or a tea garden, and at night, with the arrangement of screens, it becomes a number of sleeping rooms, which are used by the entire family.

A home upon the banks of the Desplaines River, near Chicago, is provided with an out-of-door sleeping porch so unusual and interesting that it deserves a passing mention. The district is altogether rural and the house is set almost literally in a forest. The flat deck of a porch upon which opened a bedroom window has been arranged with a roof of glass which is usually open, but which may be readily lowered should a shower occur. About the sides are hung curtains of "khaki," which are attached by brass rings to slender metal rods, and which are pushed back unless needed as protection from dampness or a draft. This very simple arrangement makes it possible to sleep almost in the heart of a forest, for only a few feet away and above the iron beds which are used are the trunks and boughs and the foliage of trees, and the fragrance of pines is always in the air. In this wonderful sleeping place, entirely in the open, one may sleep under the silent stars or the silver moonlight may fall between the heavy foliage of the overhanging boughs. In the fall the rich tints of autumn leaves are just overhead, and during the winter, when the glass roof is lowered, the snow-laden branches of the trees are just outside. Perhaps only in such a place can the splendor and majesty of a thunderstorm be fully appreciated. Imagine being tucked snugly in bed, protected from the all-surrounding dampness, and watching just overhead the terrific downpour of rain and the flashes of lightning which accompany such an upheaval of nature.

One of the encouraging features of the interest which is taken in country living and in all forms of out-of-door enjoyment is the fact that it appeals to all classes of people, for it offers as much—possibly more—to the poor as it brings to the rich. An example of the longing for the open air and for the physical upbuilding which it gives may be seen in the crowded districts of any American city, and in the number of people who may be seen sleeping upon the grass in city parks and squares where, during the worst of the summer's heat, the practice is permitted. The opposite of this very simple means of enjoying the freshness of the open air may be seen in the beautiful and luxurious open-air sleeping roofs and balconies which architects are planning for city homes and upon country estates. Between these widely separated examples are all kinds of sleeping porches, open-air verandas, and many and divers contrivances which fulfil the same purpose, and the health and strength which sleeping in the open affords and the enthusiasm with which the movement is being received are greatly increasing the number of those who are putting the idea into consistent practice.

New York City.

The Mood of England

BY EDWARD PORRITT

BEFORE the reform of the House of Commons in 1832 the House, at the instance of one of its members, occasionally devoted a day to the consideration of the state of the nation. Those were the days when there was no pressure for legislation; when sessions were short; when everything at Westminster moved at a leisurely pace; when the landed aristocracy controlled both the House of Commons and the House of Lords, and thru this control of Parliament also dominated the Cabinet and every department of state. There is no member of the House of Commons today who can recall a discussion of the old-fashioned kind on the state of the nation; but it would seem to a recent visitor to England that the people themselves have taken over the discussion of the state of the nation, and are discussing it in newer and wider aspects; for there is no question on which public attention is riveted today so much as the hard lot of the class that has been described since the days of George III as the "lower orders."

Not long ago I made a call in London on a man of international fame as a writer on political science, and in particular on recent developments in the constitutional history of England. From me he wanted to know the issues on which the approaching Presidential election will turn. I told him that they were all economic, and that politics in the United States today were centered more than ever on economic questions. "It is beginning to be the same in England," he replied; and as I went about in London and in provincial England, I realized the truth of his statement. In the present session of Parliament there is a government bill for the disestablishment and disendowment of the church in Wales, as well as a home rule bill for Ireland. Thirty years ago a bill for the disestablishment of the church in Wales would have aroused much enthusiasm among nonconformists all over England. Today it is clear that in England few people are showing any enthusiasm for the proposal of the government for the disestablishment of the church in Wales. The only public meetings in England on the question are those of churchmen who are opposed to the disestablishment of the Welsh church; while the free churchmen, and those people who have no steady use for any of the churches, seem to be indifferent as to whether the church in Wales goes on as it is, or whether in the present session of Parliament it meets the fate that befel the Irish church at the hands of Gladstone in 1869.

Time and again I discust the work of the Parliamentary session of 1911—the veto act and the insurance bill, and also the work that the government had outlined for the Parliamentary session of 1912. I talked these over with men who are on the floor of the House of Commons and with men in the press gallery. I cannot recall any mention, sympathetic or otherwise, of the government proposal of disestablishment of the church in Wales. Had I gone into Wales, perhaps I might have discovered some enthusiasm over the prospect of speedy disestablishment of the church there. In England I found none at all. There was a time when the established church in England was much more than an anomaly—when tithes and church rates were a burden that was acutely felt by nonconformists, and when also the church was in possession of privileges that often meant rank injustice for men and women who were not of its membership. But most of these grievances, thanks to the agitation of the old school of nonconformists, were long ago remedied; and if the bishops were out of the House of Lords and the established church would lift its heavy and retarding hands from the common schools, it would not be much of a grievance that the church remained established. Established or disestablished, socially it will remain the dominant church, and nominally at least the church of the aristoc-

racy. Gladstone carried the election of 1868 on the question of the disestablishment of the Irish church. If Asquith were to go to the country tomorrow on the question of the disestablishment of the church in Wales, I do not think his policy would gain him a single additional seat outside the principality.

With home rule really in sight, Ulster was so much worked up that its people —or, at any rate, some of them—were threatening to refuse to pay taxes if a parliament is set up in Dublin. Ulster was apparently so much aroused that it would not be surprising if there were news that gatling guns had been smuggled into Belfast and Derry, as Kruger smuggled them into Pretoria in piano cases, when he became convinced that some unpleasantness was coming between the Transvaal and Great Britain. But just as keen interest in Welsh disestablishment was confined to Wales, so the fervent opposition to the home rule bill was seemingly confined to the province of Ulster. The Conservatives secured nearly twenty years of power at Westminster by their opposition to Gladstone's home rule bills; but the opposition of the Conservative leaders to home rule counted for little or nothing in England and Scotland at the general elections of 1906 and 1910.

A new generation of voters had come on the electoral lists between 1886 and 1906, a generation that could not be scared as were the voters in 1886 and 1895; and it cannot be affirmed that opposition to home rule carried a single parliamentary constituency in England or Scotland at the last three general elections. Home rule for Ireland now seems to be accepted as inevitable; and in view of the settlement of the land question in Ireland it will be accepted as a method of relieving the House of Commons of some of its enormous pressure of work by many people who in 1886 were shocked at the idea of any concession to the persistent demands of four-fifths of the Irish people.

I would not have it inferred that if Parliament were dissolved, and there were a general election on the home rule question as there was in 1886, that the Liberal government would come back with a large majority. Today there could not be an election exclusively on the home rule question; and if there were an election with home rule as one of a number of issues, the fact that the Conservatives are committed to protection might save the Asquith government from defeat. The government has lost much ground in the country. Since the general election it has lost seven bye-elections, including that in South Manchester on March 5, and that in Crewe on July 26, and with the Lords' veto question settled, if protection were not an issue, the Liberal party could go into a general election with but little hope of success.

There might be some gains for the Labor and Socialist parties, which today are not nearly so concerned in the fate of the Asquith government as they were from 1909 to the end of the session of 1911, when the budget of 1909 and the Lords' veto bill were in the balance. But there would be many losses and few gains for the Liberals; chiefly because the Liberal government has shed some of its liberalism since it came into power in 1906. Its foreign policy in regard to Morocco, Tripoli and Persia is Conservative at bottom, and more like the foreign policy of Beaconsfield from 1874 to 1880 than suggestive of a government that is dependent on Radical, Labor and Socialist votes in the House of Commons for its support. All thru the recent crises in foreign affairs the Asquith government had the support of the Tories in the House of Commons as is natural under the circumstances. But this would be no recommendation for Liberal candidates at a general election. Many Liberals and most Radicals of the rank and file would much prefer to see Conservative foreign policy carried out by Conservatives rather than by a Liberal government. In that case the opposition in the House of Commons and in the country might make itself felt, and to some degree affect the policy of the Conservatives. Similarly if seventy-odd millions sterling a year must be spent on military and naval forces and on death-dealing equipment for war, most non-official Liberals would prefer to see the Conservatives responsible for these huge and burdensome expenditures and for the policies responsible for them.

Another reason for the lack of en-

thusiasm for the Liberal Government last winter is the creation of peerages and baronetcies. More than fifty peerages have been created since November, 1905, and about as many baronetcies—all by a government kept in power by the votes of the democracy of England, Ireland and Scotland, a government whose more prominent members in the House of Commons are never tired of proclaiming at by-elections that the Liberal party stands for the people as a whole, while the Conservative party is the party of a class and of privilege. No Conservative government in the space of six years ever bestowed as many peerages and baronetcies as the Liberal government has done since 1905. Nearly every one of these creations means sooner or later a recruit for the permanent forces of Toryism and privilege, with a corresponding increase in the parasitic class —men in livery, gamekeepers, gillies and puppy-walkers—by whom the landed class surrounds itself to add to its importance or to minister to its pleasures.

It is obvious too that the Liberal government has lost ground by its shilly-shallying on the woman's suffrage question; and to some degree by the frequent and quick changes of men in the Cabinet from one office to another. A referendum at this time would almost certainly be in favor of home rule for Ireland; but this is quite another matter from prophesying that if the Asquith government were now to dissolve Parliament and go to the country on home rule there would be a majority in England and Scotland in favor of the government. If there were a Liberal majority it would be because the industrial constituencies dislike the protectionist policy of the Conservatives and dread the increased cost of living that would follow import duties in the interest of the landlords and farmers.

It is the increased cost of living that has to a large extent brought about the labor unrest that has marked 1911 and 1912 more than any years since the factory era began in England. It is this that accounted for the great strike on the railways in 1911—the greatest upheaval that England had ever seen, until the strike in the coal industry came in March this year. It is this increase in the cost of living, an increase that has outrun any increase in wages in nearly every industry for the last ten years, that has focused public attention on the condition of England question, and on the fact that there are nearly two-and-three quarter million men in regular employment in the United Kingdom whose wages do not exceed twenty-five shillings a week. Of these 320,000 receive less than fifteen shillings a week; 640,000 wages between fifteen and twenty shillings, and 1,600,000 earn between twenty and twenty-five shillings a week. Housekeepers in London assured me that today the sovereign—twenty shillings—has only the purchasing power of fifteen shillings in the nineties; and it is the widespread and acute realization of the increase in the cost of living that explains why popular sympathy was so generally with the railway men at the time of the strike in 1911 and with the miners in their recent successful demand for a minimum wage.

Nine-tenths of the railway men in England are paid wages that do not exceed twenty shillings a week. A large proportion of them are paid not more than sixteen shillings. Wages of railway men in England are lower than those of railway men in any other English-speaking country; and with the exception of agriculture, lower than in any other large industry in England. They have always been low, because when the railway era began railway men were drawn from farm laborers, and at that time wages in all industries were deprest by the statute-made conditions, so vividly described by Mr. and Mrs. Hammond in their new book on the Village Laborer from 1760 to 1832—conditions directly due to the adverse changes in the social economy of rural England brought about in the eighteenth and first three decades of the nineteenth century by the wholesale enclosure of commons and waste lands. Except the engine men, and mechanics employed in the railway shops, wages of railway men have always lagged much behind those of men in all other industries except agriculture. The rank and file of the men engaged in handling the traffic—porters, shunters and signal men and drivers of teams for the railways—were

never paid more than a mere subsistence wage; and it was because this wage, with the increased cost of living of the last few years, fell below subsistence level, that there came the great strike of 1911 and the strikes following it.

Not all of the unrest of the labor world of England is due to the increased cost of living. Over and above this there is a widespread and constantly growing conviction that at no time in the history of modern industry has labor in England had a fair share of what it produced. The reasons that are advanced for the growth of this feeling in the working classes were variously described to me. By some it was ascribed to the budget of 1909 and to the statistics as to the wealth of England that were the commonplaces of popular discussion of the budget that went on from April to November of that year. By others it was attributed to the Socialist propaganda so vigorously and continuously waged in most of the larger urban centers of population. One journalist with thirty years' experience of London and of the Press Gallery with whom I discussed it, pointing to the continuous procession of motor cars that was passing westward along the Thames Embankment, declared "these things are more responsible for the labor unrest this winter than all the Socialist speech-making.

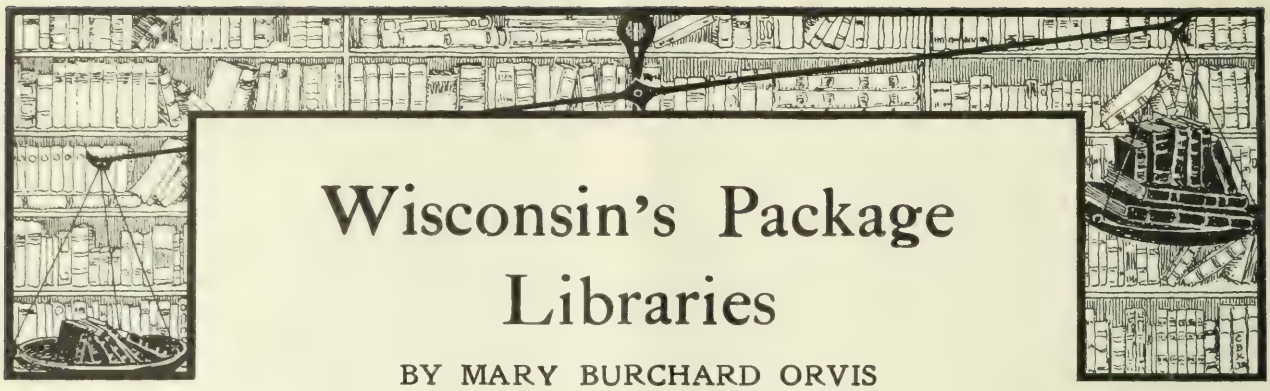
The motor car is a constant and irritating reminder of the wealth of the landlord and the employing classes; and I am inclined to think that the motor car has had its influence in bringing about the existing social unrest and the growing disposition of the working classes to demand a larger share of the produce of their labor. But after allowing for the increase in the cost of living, and the ostentation of the wealthy, the fact that best accounts for social unrest is the compulsory education legislation since 1870. The governing class, from its own point of view, did well to neglect the education of the common people—to order things so that until 1870 generation after generation of wage-earners grew up unable to read or write. The older conditions as to education and also as to the Parliamentary franchise, gave the employing class an admirably docile proletariat. Today this proletariat can read and write. The half penny newspapers are everywhere available; and moreover this proletariat has votes. Until near the end of the nineteenth century the governing class could rest in the assurance that poverty was the inevitable and hereditary lot of the "lower orders." Today the lower orders are disputing that comfortable theory of their "betters." Hence the new and widespread discussion of the state of the nation that was the dominant note in England of the winter of 1911-12.

HARTFORD, CONN.

Homeward

BY ANNE RICHARDSON TALBOT

However far her eager feet
Have wandered since she went, I know
In Spring they fain would turn to greet
Our homely lilac's purple blow.



Perhaps along Elysian ways
She sees the asphodel unfold,
And yet I think in Spring she prays
To find our dandelion's gold.

Altho in Heaven the atmosphere
She breathes be sweet with perfume rare,
I know she longs, as Spring draws near,
To scent our fruit blooms on the air.

Tho green the fields of Paradise,
Its waters still, its pastures new,
She sees 'mid all the glad surprise,
Home meadows, cowslips, wet with dew.

So when life quickens, and I hear
The reveille the Bluebirds sing,
I feel that somewhere, very near,
She waits to know the joy of Spring.

KENNEBUNKPORT, ME.

Wisconsin's Package Libraries

BY MARY BURCHARD ORVIS

THE University of Wisconsin employs many unique methods of educating the people of the whole State, but none is more effective than the little "package library," whose sole mission is the assistance of organizations and individuals that are engaged in the study and discussion of important public problems. Composed of especially prepared bulletins, carefully chosen magazine articles and newspaper clippings, association and Federal reports, the library is a most useful tool. "Politics, propaganda," you say? By no means. Political questions of the utmost importance are discussed, but never in a partisan way, for the library is composed of the best material on *both sides*. The debating bulletin invariably gives arguments and references for the affirmative and the negative, and if no arguments can be found on a given side, the attention of the public is called to the fact that the subject is new, and the opposition, or support, not yet developed. Not even the inevitable enemies of a State university have ever been able to pick a flaw in the management of this delicate work, involving the most careful selection of material to be presented for public discussion and debate.

"The package library," composed of from two to one hundred articles, is sent out in response to any request from within the State, whether the petitioner be the district school pupil or the president of the Milwaukee Civic Association. There are no charges except the payment of express one way, and material may be kept three weeks and then renewed. From June, 1911, to June, 1912, there were 2,450 of these little torch-bearers loaned to 313 different localities, and they covered 684 different subjects; 2,450 groups, not individuals, were made acquainted with the most authoritative literature on important questions, literature chosen from the most reputable sources. No wonder Wisconsin lawmakers come to the State House well equipt to cope with the problems of the day! No wonder a legislature composed largely of farmers can pass intelligent laws on primary election, workmen's compensation and forestry, when they are in the habit of discussing and hearing their children debate those very subjects in the district school, guided by the State's highest institution of learning!

The ten libraries receiving the most calls during 1911 and 1912 are very significant of the trend of public interest:

Subject.	Number lent.
Woman's Suffrage	217
Taxation—Income Tax	104
Commission Government	103
Initiative and Referendum	65
Parcels Post	57
Immigration—Restriction	44
Recall of Judiciary	42
Schools as Social Centers	36
Senators—Election of	35
Recall—General	31
Capital Punishment	29

These are the matters in which the people of Wisconsin are interested, not the people of the university, but the rank and file of citizens, the butcher, the baker and the candlestick maker. Woman's suffrage, because the last Legislature passed a bill putting it up to the people at the November election; commission government because the same Legislature passed a very good law, under which citizens may adopt it; income tax, because it is being given a practical test in the present assessment.

Municipal ownership is another subject in which the people of Victor Berger s State are interested; so is that of the closed versus the open shop. Certainly only a wide-awake people care to discuss subjects demanding any such amount of preparation. A man from a foundry in the northern part of the State writes: "I wish to thank you for them (articles sent on the subject of workingmen's compensation), as they proved to be a success, and last evening's meeting was the most enthusiastic meeting we have ever had. Thanks to the University of Wisconsin Extension Division for its valuable assistance." That is a letter typical of hundreds received every month from all classes of people.

But it was not ever thus! In the early days requests came only too often for material on the most trivial of subjects —material to be used by stalwart youths, who should have been preparing themselves for the solution of the nation's problems. Debates innumerable have been headed off by Mr. Hutchins, secretary of the Department of Debating and Public Discussion, who frowned on the question, "Resolved, That summer is pleasanter than winter," and its counterpart, "Resolved, That poverty is preferable to riches." What a field for the conservation of human energy, this work of leading the young mind into the paths that it must follow, if it is to be of service in the world!

When I said that package libraries were sent on any subject, I should have qualified it. For the university is not in the business of furnishing material for the discussion of trivial matters. Its primary function is to lead the people of the State to the consideration of matters that have some value, either cultural or practical. So, when requests of this sort come, Mr. Hutchins writes the young (it is to be hoped it is "young") offender a letter in which he tactfully suggests that perhaps his teacher can help him to find something more suitable for public discussion. In addition, he often writes "teacher" a word of advice as to how the youthful oratorical impulse may be better directed. Above all else, he impresses upon the mind of teacher, pupil, debater or leader of discussion the fact that the material sent ought to be used to search for truth rather than to win a given debate; above all else, he urges dispassionate discussion, and warns of the pitfalls common to oratory. Practically the first bulletin got out by this department dealt with the organization of debating societies, and gave careful and clear instructions as to parliamentary procedure. Indeed, so clear was its chart of rules that it has since been printed separately for the use of members of the Legislature, and during sessions you will see it propped up on the desk of many a Wisconsin lawmaker.

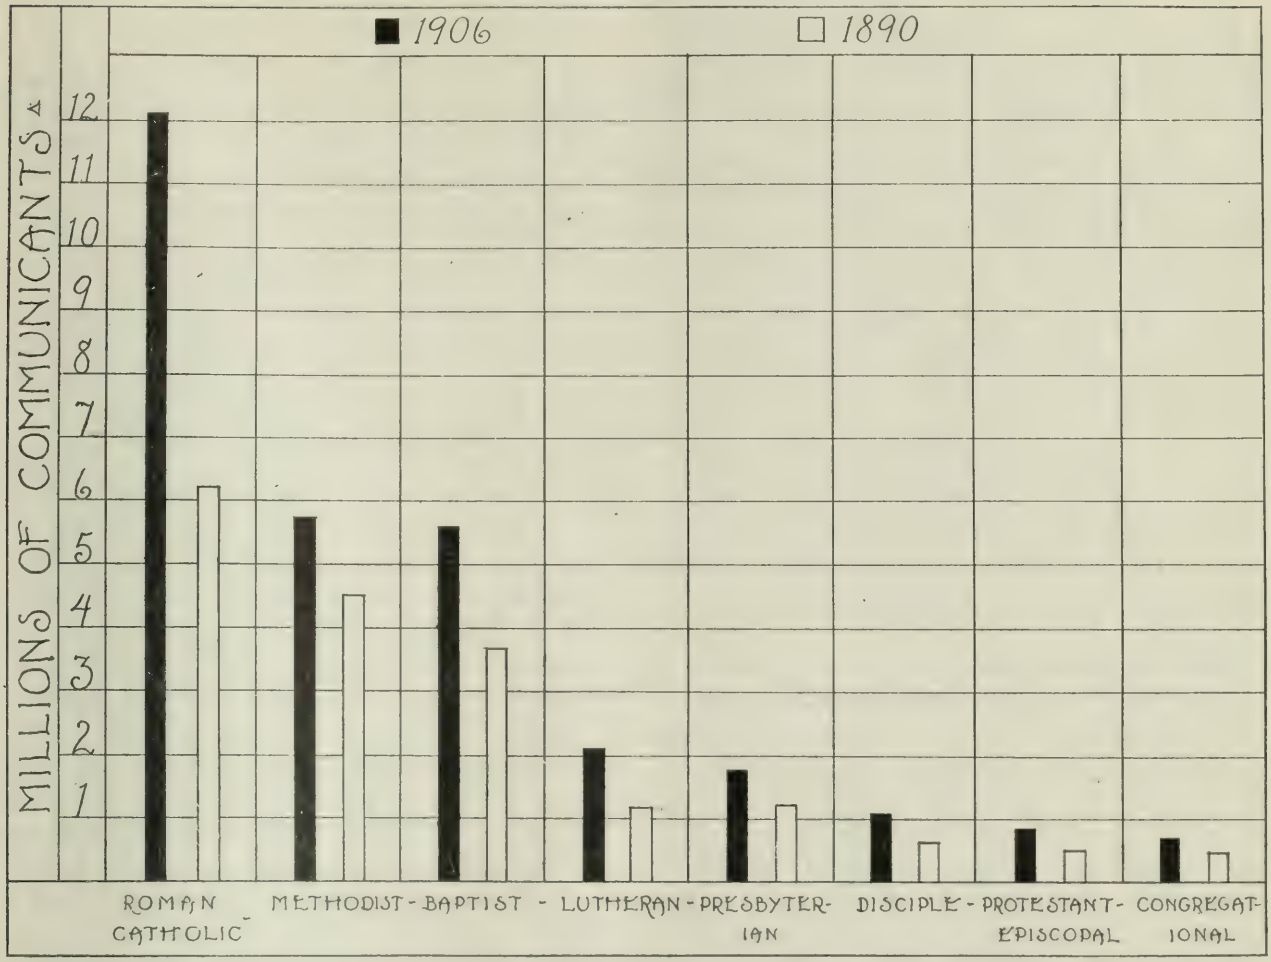
Not only is there a complete change in the character of public discussion, but in the manner. With some of the best library facilities of the world at hand (University of Wisconsin Library, Legislative Reference Library, Madison City Lobrary, State Law Library), it is natural that the university should be able, with the additional aid of its experts, to provide the citizen with infinitely better material than is obtainable in his own town. The package library, like the Legislative Reference and the Municipal Reference libraries, is bound to be a success if properly managed. But only Miss Almere Scott and her assistants engaged in its actual making, can know the difficulties that have to be overcome in order to make limited financial resources do the enormous day's work of sending "by return mail" a judiciously chosen library on any subject under the sun.

Who can estimate the value of an institution that teaches people how to discuss vital matters intelligently and dispassionately? That is what the University of Wisconsin is attempting with great success. Its debating bulletins on various important subjects give general, affirmative and negative references and facts, stating issues definitely and clearly. Who can estimate the influence on the public mind, on the mind of the individual, of such guidance? Farmer Jones, inclined to pouf pouf any "new fangled thing," learns to look facts in the face and to discuss, according to facts, parcels post and good roads. Who can measure the benefit of friendly discussion under convivial circumstances, such as the gathering of the business men's club? Yet that is just the sort of thing

that the university is encouraging and organizing all over the State of Wisconsin. A lumberjack writes from the northern woods for a library on the tariff question, and returning it, tells gratefully of the renewed life that has come to his small group thru the discovery that there is an organization capable of supplying them with suitable material for discussion. A woman wrote from an isolated valley district, wondering if her little club, dying out for lack of stimulation, could obtain material on the subject of child labor, which she had heard is a national problem. On receiving it she sent a pathetic letter of thanks, telling of how she and her friends had tried for years to get help in the study of various educational questions mentioned in their newspapers; in vain had they applied to supposed sources of information, until they learned of the University Extension Division, which had "given them new life."

It is interesting to note that other States—Oregon, Kansas, Texas and Virginia—are pursuing the Wisconsin method of directing and aiding public discussion. And that is just what the Wisconsin people want, for two reasons. One is that they are sadly overburdened by daily calls from other commonwealths. Last year they sold bulletins to the citizens of thirty different States. When New Hampshire was having a series of suffrage debates, sixteen calls came in four days for Wisconsin "libraries," and at an earlier time whole counties in another State adopted the Wisconsin bulletin on debating as a textbook in their schools! Obviously there is a natural demand for systematic aid of public discussion; a demand which one State cannot possibly attempt to supply, however willing. So it has had to ask that non-residents pay the cost of the bulletins sent them, and is forced to deny all requests from outside the State for libraries.

The other reason why Wisconsin wants her libraries imitated is that she needs the co-operation of other States. The establishment of similar institutions, each preparing and exchanging bulletins with the other, is Mr. Hutchins's dream. If ten neighboring States would prepare bulletins on different subjects, the influence of each would be enormously increased thru the resulting efficiency of covering a few subjects fully. Here is a field for the Carnegies of the land! Wisconsin has pointed it out and has indicated how its ideal of promoting the enlightened discussion of public matters can be attained. She has shown how, by virtue of freedom from economic pressure, a State can run an efficient department of public discussion. Los Angeles, with her municipal newspaper, seems to be demonstrating how a similar institution can aid in the formation of public opinion. The municipal newspaper prints side by side the arguments on a given question; prints them without censorship, except as to facts easily proved. The "package library" does the same sort of thing, only instead of reaching individual readers, it deals primarily with *groups,* its function being the promoting of public discussion and debate.



To dwell upon the need for a definite sort of group education in this day of intense interest in public affairs is not necessary. If the people are going to rule the people, it is all important that the people study political problems. If we are to have the initiative and referendum, we must inform ourselves on the questions to be so decided. If women are to vote, after centuries of silence, they must first discuss intelligently at their clubs and thimble parties. It is true that the press has a vast influence in the formation of that very concrete thing called "public opinion" by the believer in the people and "mob mind" by his antagonist, but not all voters read the best papers and magazines, and not all of the best publications print the arguments and facts on both sides of any matter. Since we have only one municipal newspaper and no endowed press, let us make the most of a very potent weapon in the fight against ignorance of governmental and social problems—the traveling "package library."

MADISON, WIS.

Church Membership

BY WILLIAM B. BAILEY, Ph.D.

ASSISTANT PROFESSOR OF POLITICAL ECONOMY AT YALE UNIVERSITY.

OF our total population of about 92,000,000, almost 33,000,000 are communicants or church members. Of these 20,300,000 are members of Protestant bodies and 12,000,000 members of the Roman Catholic Church. The Latter Day Saints reported in 1906 a membership of about 250,000, while there were a little over 100,000 heads of families who were members of Jewish congregations. The average size of the Protestant church membership is 104, while that of the Roman Catholic churches is 969. The membership of all bodies reporting over 500,000 was, in 1906 and 1890, as follows:

	1906	1890
Roman Catholic	12,100,000	6,240,000
Methodist	5,750,000	4,500,000
Baptist	5,660,000	3,712,000
Lutheran	2,112,000	1,231,000
Presbyterian	1,830,000	1,278,000
Disciple	1,142,000	641,000
Protestant Episcopal	886,000	532,000
Congregational	700,000	512,000

All of these denominations have shown a growth during the fifteen years covered by these figures, but the membership of the Roman Catholic Church has almost doubled.

In the Protestant churches 39.3 per cent. of the members were males, while in the Roman Catholic Church almost exactly half of the membership was composed of males. The seating capacity of the Protestant churches was, in 1906, a little over 53,000,000, while their membership was about 20,000,000. The seating capacity of the Roman Catholic churches was about 4,500,000 for a membership of over 12,000,000. The total capacity of the churches suffices to seat at one time about 70 per cent. of the population of this country.

The value of the church property is about $1,250,000,000. Of this $935,000,000 belongs to Protestant bodies and $292,000,000 to the Roman Catholic Church. 164,830 ministers are reported, 146,451 by the Protestant bodies and 15,177 by the Roman Catholic Church. The average salary paid to these ministers was $663 per capita.

NEW HAVEN, CONN.

Midnight

BY E. P. POWELL

Author of "The Country Home," etc.

THOSE who do not know midnight do not know the world in one of its happiest moods. Every insect claims it as his world, just as the clock strikes twelve. Frogs grow musical; and surely, in this campaign year, some of them are croaking politics. We can distinctly hear Wilson! Wilson!—while others are for Roose-velt, and one whole pond is devoted to Taft. They get together in conventions along the shores and croak it out to their hearts' content. Just the color of the bark, our tree toads are hid all day directly under our eyes and at night join in the primary, while the editor drowses on his country porch. The world does not belong to us at midnight.

Suddenly a chuck-wills-widow calls out from down the lane, and a genuine whip-poor-will laments in the pine grove. It wakes a mocking-bird, who cries out impatiently and sleepily, "Get out! get out!" and then "what-a-fellow! what-a-fellow!"—then he drops off drowsily into sleep, with "Shut-up-silly! shut-up-silly!" It is truly funny to hear a half awake mocking-bird trying to sing one of his rôles. When fully awake they mostly chatter whatever combination of sounds occur spontaneously; but at midnight their solos travesty song. This is not so with the catbird, whose rehearsals by moonlight rival Jenny Lind.

Let us take a stroll thru the orange grove and pick pockets full of figs and guavas. Lemon trees are in blossom, for they bloom every month, and they fill the air with delicate odor. Folk are afraid of midnight. Nonsense; the ozone in the air is heavy, and while we sit in a grape arbor we also remember that grapes are healthy for night lunches. The Black Hamburg reaches down its big clusters, along with the Niagaras and Ellen Scotts, and we do not refuse.

The moon has the remarkable good sense of lighting up midnight—never garishly; never to annoy our senses. How carefully everything is adjusted not to fret or tease. Ninety-eight at noon is now seventy-nine, and a sweet, soft breeze from the Gulf is better than a patent electric fan. It rolls sweet odors over us, plays with leaves, and almost articulates in the moonbeams.

The great golden flowers of the alamandas are softened into silver where they hang from the balcony and cover the whole side of the cottage. Marechal Neil roses remind us of their abundance only by their fragrance, and we walk down between the Jacks and the Paul Neyrons and the Killarneys, able to distinguish them one from another, not by sight, but by that delicate yet despised sense of smell. Cannas alone are golden enough to hold some semblance of themselves even at midnight.

Why not a row on Lake Lucy? The water is still, not a ripple. It is a mirror for the great pines that stand around it. It is full of fish, but we are not here to disturb them. They watch us safely, and once in a while one or two jump out ahead of the boat; is it to get a better view of us, or is it to reach the moon? Who knows the thinking that is going on around us? Only this we know, that the world is charged with thought.

Out in the middle of the lake we stop our oars. Let us dream over some old time rhythm that punctuated our boyhood or our mid-life. What has been real along our way? It is that which tonight we can realize, if we cannot recall it; a dozen friendships, and a lot of wholesome trials of our manhood. We know the world better and from a truer standpoint. Living is a mean thing, if it be carried on without any life.

Which is home, that cottage over on the bank, half covered with wistarias and honeysuckles, or is it this star-capped world—or is it both? Life should surely teach us to be at home with God. This is the one great thought, that our Father is in all the heavens. One has lived to little account if he has not learned this simple truth that it is not space which divinity requires. One may be great in a hovel. Midnight is a world of wonderful glory. Try it.

Sorrento, Fla.

Literature

Racial Progress

For the first time in history humanity is becoming conscious of social solidarity and is organizing for intelligent control and direction of the forces making for racial progress. It has been decreed that blind animal instinct, with its entail of misfits and destructive methods of selection, is to give way to human reason informed by the facts of science and inspired by the noblest aims. The decree is no less divine because it has been made manifest thru biology, the study of social conditions, and the new science of eugenics. It is now evident that the clear apprehension of the problems of race culture and the determination to solve them in the light of evolutionary science are destined to create a moral enthusiasm not unlike religious fervor. Significant in this respect is the title chosen for the series of booklets published under the auspices of the National Council of Public Morals in London. These *New Tracts for the Times*[1] recall in their name the stirring manifesto of the famous religious movement in England two generations ago, but instead of dwelling on sacramental rite or council decree they center around the dominant conception of the regeneration of the race, and might properly be styled, as the general editor, Rev. James Marchant, well says, New Tracts for *New* Times. Fundamental in racial progress are the *Problems of Sex,* which two of the greatest authorities on the subject discuss briefly in one of these volumes. In simple, direct language they set forth some of the biological, social and psychological aspects of sex evolution and their significance in modern life. It is worth much to have this candid and salutary presentation, for a just and fearless comprehension of these vital facts and relationships of sex must lie at the basis of any effective movement toward race regeneration. Another "tract" written by Dr. Horton is devoted to a consideration of *National Ideals and Race Regeneration,* for many motives must be utilized in quickening the social pulse, and patriotism is not the least effective. National solidarity and ambition for high attainment will in no way conflict with the spirit of world-federation, but rather contribute more fully to that end. Dr. Horton's ideal for the nation comprises the elements of health, wealth justly distributed with poverty blotted out, a wholesome intellectual life, and moral and spiritual culture, always preserving those fundamental principles of liberty for which Anglo-Saxons have so long struggled. And, best of all, the author is but one of many who believe this ideal is slowly moving into the realm of possible attainment.

This possibility has been brought about to some extent by the advancement of woman toward fuller rights and responsibilities, and it is certain that the future realization of racial progress depends largely upon the training, status and aspirations of womanhood. In still another one of these "tracts" Dr. Mary Scharlieb shows the intimate relationship between *Womanhood and Race Regeneration,* laying special stress upon the importance of proper training, and urging the assumption by women of those activities, both in home and public life, which influence racial welfare.

For a more ample and inspiring account of woman's part in social and racial uplift one may turn with satisfaction to the excellent volume by two American writers on *Woman and Social Progress,*[2] which is correctly described in the subtitle as "A Discussion of the Biologic, Domestic, Industrial, and Social Possibilities of American Women." The dominant biological function of woman as the conservator and transmitter of racial developments and characteristics, and

[2] Woman and Social Progress. *By Scott Nearing, Ph.D.,* Wharton School, University of Pennsylvania, and *Nellie M. S. Nearing,* B.A. Bryn Mawr, M.A. University of Pennsylvania. New York: The Macmillan Company. $1.50.

her special physical and mental capacities are made clear as a scientific basis with which to articulate the facts and forces of the new social environment, which, particularly in our country, is influencing the women of the present. The authors show how the domestic revolution following in the wake of the nineteenth century industrial revolution, the breakdown of traditional bonds, the establishment of larger educational facilities, and the opening of various doors to industrial activity have given to women almost unlimited opportunity for choosing the pursuits to which their lives shall be devoted. While this process of emancipation is not complete, so much has been achieved that the resulting responsibilities deserve careful attention. Every woman, the authors contend, should choose some occupation, the first alternative being motherhood, provided health and income allow it. Constructive industrial and social effort is a crying need which woman can do much to supply, but her first choice should normally lie along the line of racial development. In the processes of biological selection and social training woman is more and more "nature's supreme instrument of the future," and she must see in her own possibilities "a measure of the potentiality which is expressing itself in social evolution and progress." Thus concludes a book which, from the importance of its subject, and by virtue of its sound thought and worthy expression, ought to be in the hands of every intelligent woman in the land.

But one does not delve very far into these problems before he realizes that one of the greatest obstacles to be overcome is the far-reaching scourge of poverty, which lies like a blight on all the aspirations and efforts for conscious race betterment. From the standpoint of racial evolution it is strikingly true that "the destruction of the poor is their poverty." We welcome, therefore, the masterly little volume in The Art of Life Series by Charles F. Dole, who points out the nature and magnitude of *The Burden of Poverty*,[3] considers its cause and effects, and makes some practical suggestions about what can be done. There is no array of statistics, no fatuous pursuit of some panacea, but his noble vision of reconstruction is as stimulating as his vigorous presentation and analysis of facts is convincing. In reading this volume and Professor Nearing's stirring monograph in the same series[4] one feels that somehow society must throw off this oppressive burden and make such economic adjustments as will put a premium on the parenthood of the racially fit. By taking additional precautions to prevent the propagation of the unfit, it may be possible for us in America to usher in *The Super Race* which Professor Nearing believes possible thru the application of the science of race culture, the remolding of certain social institutions, and the freer educational development of the individual. "May these things be." In the meantime, perhaps Dr. Horton is right in his assertion that today "we need teachers in pulpits and college chairs, in schools, in papers and books, to bring home to our people today the truth that the best service we can render to the state is to bring up wholesome and efficient sons and daughters to be the life of the nation in the immediate future."

[3] THE BURDEN OF POVERTY. WHAT TO DO. *By Charles F. Dole.* New York: B. W. Huebsch. 50 cents.

[4] THE SUPER RACE. AN AMERICAN PROBLEM. *By Scott Nearing, Ph.D.* New York: B. W. Huebsch. 50 cents.

Italian Haunts for Traveler and Student

THE charm of Italy never ceases to lure thither travelers and students in large numbers. The variety of climate and natural scenery, the abundance of antiquities marking the progress of millenniums of civilization, and the rich stores of ancient, medieval and modern art, furnish satisfaction for quite conflicting desires. To exploit the treasures and attractions of that inviting land an increasing volume of literature is coming from the press. As one looks over the table of new books he finds worthy presentations of many aspects of Italian allurement and trusty guides in whose company he may enjoy the offerings which interest him most. First of all we may note that the traveler who wishes to get cultural value from his explorations in Italy's art and architecture will do well to supplement his

Baedeker with Grant Allen's *Historical Guides* to *Venice, The Umbrian Towns* and *The Smaller Tuscan Towns,*[1] which have just appeared in new editions. The discussions and comparisons made by illustrations are always illuminating and much interesting lore is added to the well-sifted historical information.

Not only as a preparation for traveling, but as a constant delight to the artistic sense, many will welcome a splendid collection of half-tones which bring most vividly to the eye more than three hundred important pieces of *Baroque Architecture and Sculpture in Italy.*[2] The introduction by Corrado Ricci, Director-General of Fine Arts and Antiquities of Italy, altho too short, contains a good résumé of the subject, and the workmanship on the reproductions is of the best German type. Those whose tastes incline them to look for less frequented ways of approach to the great life of the past will peruse with pleasure Miss Crumpton's *Leaflets from Italy,*[3] most of which are devoted to the life and times of the Empress Galla Placidia and an exploration of the historic and artistic haunts of Genoa.

For a student's excursion to the numerous sites of neglected and half-forgotten cities that once rivaled and imitated the architectural features of ancient Rome as she advanced toward the mastery of the world, one should be equipt with Professor Frothingham's absorbing account of the monumental remains of old *Roman Cities in Italy and Dalmatia.*[4] These archeological studies throw much light upon early Italian life and supply valuable information about the development of the Eternal City, so that Professor Frothingham seems justified in his opening declaration that "to know Rome well you must go elsewhere." The personal note in the volume gives additional zest to the reading.

But some will be brave enough to immerse themselves in the complex life of the Italian communes of the Middle Ages as a preparation for understanding the expressive art of the Renaissance and the modern movements toward political and national unity. For such enthusiasts a suitable book is at hand in the scholarly and exhaustive *History of Perugia,*[5] in Armstrong's series on the States of Italy. While modern progress is fast obliterating the medieval monuments of this fascinating old city, research is giving us a more adequate picture of her past, and this Mr. Heywood has done well to present so ably to English readers.

Not all, however, who write of Italy stand in awe of her ancient landmarks or sing the praises of her works of art. To a soul born in the atmosphere of free America, and nourished in institutions as expansive as the rolling prairie and as vigorous as the mountain storm, the art which grew out of a religion of miracle, of human repression and suffering, may often appear couched in forms too effete and depressing to bring other than disappointment. Such a soul, refusing to be bound by tradition, and in revolt against that particular spirit of Italian art that belittles nature and condemns normal human passions and experiences, is Mrs. Mary Austin, whose *Christ in Italy*[6] is worth reading for its freshness of imagination and vigor of style, to say nothing of its trenchant criticism of the art that clothes the Virgin's image in gold while it leaves the shivering mother to walk the street in rags. Perhaps in no other country could such great contrasts be found between the sublime visions of the other world and the stern and sometimes awful realities of this. For the sociologist as well as the lover of art and history Italy has her message, which she utters in no uncertain voice.

Democratic England. By Percy Alden, M. P. With an Introduction by Charles F. G. Masterman. New York: The Macmillan Co. Pp. xii, 271. $1.50.

Within the last seven years a revolution has taken place in England—a revolution not yet complete and one which, like all the great revolutions of history, has its rise in ideas. The nation has awakened to the misery of millions of its members, and the awakening has been accompanied by the determination to put an end to the misery. Already many steps have been taken in this social revolution. Old age pensions have removed the haunting shadow of the workhouse from the lives of honest, hardworking men and women whose weekly incomes cannot suffice to make any provision for their future. The sweated worker—man and woman, but especially woman—has the hope of a minimum wage fixed by law, a minimum which, paltry as it may seem, is in many cases more than double what these patient toilers had previously received for their long hours of work. The bodies of the children who attend the nation's schools are being cared for as well as their minds, and food and medical attention are being recognized as at least equally necessary for the welfare of the future generation with arithmetic or geography. Housing, unemployment and sickness of the workers have all been subjects of recent legislation by Parliament, while municipal ownership of what are essentials of life to the town dwellers is being extended and perfected. Above all, the question of the land and its use and ownership are causing much searching of heart, and the disinherited, landless peasantry of rural England may before long again come into their own. Many books have been written on different phases of this revolution, both of the nature of discussions of the problems, and histories and explanations of the acts of Parliament that have been passed to cope with them. Old age pensions, the insurance act and the land question are all subjects of numerous volumes. In *Democratic England* Mr. Percy Alden has gathered into short and readable form all the different phases of the social revolution. Mr. Alden has worked long and devotedly in the cause of social reform. For twelve years he was in charge of the Camden Town social settlement, and at the general election in January, 1906, he was elected to the House of Commons by the great urban constituency of Tottenham, practically part of North London. Like many others of the leaders in the movement for social reform, Mr. Alden is a member of the Society of Friends, and he writes in the sane, reasonable, truthful and sympathetic spirit that is characteristic of the Quakers. There is nothing yet in print that gives a better or more understandable account of the conditions which have aroused thinking England to the need of reform, and of the steps which have so far been taken to meet this need.

The Common People of Ancient Rome. Studies in Roman life and literature. By Frank Frost Abbott. New York: Charles Scribner's Sons. $1.50.

"Who is of so hardened a heart and so untouched by a feeling for humanity that he can be unaware, nay that he has not noticed, that in the sale of wares which are exchanged in the market, or dealt with in the daily business of the cities, an exorbitant tendency in prices has spread to such an extent that the unbridled desire of plundering is held in check neither by abundance nor by seasons of plenty!"

This denunciation of the high cost of living is not a quotation from a current newspaper, but dates from 1,600 years ago, when the Emperor Diocletian tried to check the pernicious tendency by an edict fixing the maximum of prices and wages. These price lists, under Professor Abbott's skilful handling, prove to be full of human interest and bring us closer to the people of ancient Rome than volumes of poetry or history. At first it strikes us as strange that there should be any complaint of the cost of food when eggs were less than 2 cents apiece, beef less than 5 cents a pound, and butter less than 10, but we perceive the reason when we turn to the other side of the ledger and see that skilled laborers got 21 cents a day and keep, teachers 33 cents a month per pupil, and lawyers $5 a case. The author calculates that the American workman gets from nine to fifteen times as much wages as the Roman of 301 A. D., and has to pay about three times as much for his meat.

The next chapter is equally timely, for it deals with "Private Benefactions and Their Effect on the Municipal Life of the Romans," and then we come to the subject of corporations and trades unions, and Professor Abbott tells us about the oil trust—olive oil, of course—and the general strike of the proletariat. In short, he succeeds marvelously in bringing Roman life to life and in showing us, without any sensational straining of analogies, that the people of that day were confronted with much the same problems as we are now, and were trying in much the same way to solve them.

The Promised Land. The Autobiography of a Russian Immigrant. By Mary Antin. Illustrated. Boston: Houghton Mifflin Co. $1.75.

The charm of *The Promised Land* lies in its frank egotism. The story of a young soul, thoroly self-conscious, eagerly beating against its narrow environment, and taking the measure of that environment with more than the usual certitude of a new inhabitant of what a poet has rightly called "this handsome house of dust." Frank egotism the charm, but a genius for self-study the informing spirit—genius and an environment for the "handsome house" that many millions have had and only the exceptional spirit has been able to make so clean an escape from and to make so accurate survey of from the outside. The Pale, within which the Russian Jew in that step-fatherland was tethered, and from which he could escape in only one direction—to the West, to the land of the untethered, to America—that was the birthplace of the little Mashke Antin. Eleven she was when the little soul in its diminutive body escaped from its early environment, which had become hateful to her, tho the soul had played prettily in the old house and thru its windows had seen how sweet the heavens are to the young. At eleven the land of the blest came in sight, and for fifteen years Mashke Antin was engaged in a complete readjustment of herself to the world as it had become in the West. The emigration and the immigration became to her a double world indeed.

"All the processes of uprooting, transportation, replanting, acclimatization, and development took place in my own soul. I felt the pang, the fear, the wonder and the joy of it. I can never forget, for I bear the scars. But I want to forget—sometimes I long to forget. I think I have thoroly assimilated my past—I have done its bidding—I want now to be of today. It is painful to be consciously of two worlds. The Wandering Jew in me seeks forgetfulness. . . . I take the hint from the Ancient Mariner, who told his tale in order to be rid of it. I, too, will tell my tale, for once, and never hark back any more. I will write a bold 'Finis' at the end, and shut the book with a bang."

Frank egotism, a genius for self-study, and a felicity of expression in the richer terms of the New World—these three qualifications—and a story to tell. At the end of it she is no longer "Mashke," but "Mary" Antin—a full-fledged product of American free schools, free thought, and noble enthusiasms. The reader feels that he has accompanied the little Jewess thru all that great, sad wandering and can now understand the gladness she felt in her heart when the song of the nation rang thru the rooms of the schoolhouse where she learned to be an American:

"O, say, does that star-spangled banner still wave
O'er the land of the free and the home of the brave?"

"Delicious tremors," she tells us, "ran up and down my spine, and I was faint with suppressed enthusiasm." She is no longer a little girl, but a wife and mother with a college degree hung up somewhere, and a vast hiatus between her present and her days of wandering. George Washington is now in *her* background, and "Old Glory" swings over her as one of the fellow-citizens in the land he won for all exiles.

The Toll Bar. By E. J. Buckrose. New York: G. P. Putnam's Sons. $1.35.

This book suffers from overdoing its pretensions to mystery. As a matter of fact there is nothing in the two tragic events out of which the action of the story principally grows that a reader of very moderate discernment cannot guess correctly by the time he has reached the end of the second chapter. The one real surprise of the book is the appearance in person, almost at the end, of a woman only rather casually mentioned in the earlier chapters, whose importance as a link between lives far apart socially would hardly have been suspected. Her

brief and dramatic entrance and exit are the most telling features of the story, for what she represses in her short confession leaves a more haunting memory behind as she drives away in her motor car than the agonies of the hero, for instance, which seem made much of without sufficient cause.

Literary Notes

....The addresses given at the Robert Browning Centenary celebration at Westminster Abbey last May have been edited by Professor William Knight (Houghton Mifflin; 75 cents).

....In the interest of the National Association for the Study and Prevention of Tuberculosis, Dr. S. Carrington publishes, for one dollar, *Fresh Air and How to Use It.* The book is elaborately illustrated, and is completely descriptive of ways of adapting ordinary houses to the needs of tuberculous patients.

....The decline of the apple crop on the small farms in the East is one of the commonest signs of unscientific farming. M. C. Burritt's handbook, issued thru the Outing Publishing Company, on *Apple Growing* (70 cents), is a volume of admirable simplicity and point on the care of the apple orchard, its protection from pests and the methods of handling and marketing the crop.

....The frontiers of travel for the summer tourist are being pushed farther and farther back. At last we have a new line of steamers sailing direct from New York to Libau in Russia. But there has been no guide-book to Russia published in English. Now comes Ruth Kedzie Wood's *The Tourist's Russia,* well printed and illustrated, and sold for $1.25 by Dodd, Mead & Co.

....The Very Rev. H. D. M. Spence-Jones, M. A., D. D., Dean of Gloucester, seems to have thrown together a good many odds and ends in his volume on *The Early Christians in Rome* (Lane; $4), discussing a variety of subjects from the Christian "schools of martyrdom" to the composition of the Talmud. Familiar ground is traversed again and again without discovering any new facts or making combinations of the old ones fraught with new meaning. Old errors, some of them very old, are repeated, and more recent ones are received with evident satisfaction. The most valuable part of the book is its collections of quotations from early sources, but even these lack the necessary critical exposition to make them yield their best historical fruitage.

Pebbles

HOSTESS (after presenting fan to prize-winner at whist drive).—Really, I'm afraid it's hardly worth accepting!

Winner (appraising its worth).—Oh, thank you so much; it's just the kind of fan I wanted—one that I shouldn't mind losing.—*Punch.*

R. R. M.—I am the person who shakes hands as if he were reluctantly offering a dead fish.

A. A. B.—I am the ready-to-wear clothing salesman who doesn't smile when a customer says, "I never had a ready-made suit before."

W. B. G.—I am the woman who always curls her finger when she holds a teacup.

W. E. L.—I am the traveling man who was invited out to the boss's house to dine and from force of habit wiped my plate, knife, fork, and spoons carefully with my napkin before beginning to eat.—*Chicago Tribune.*

"How many children have you, Mrs. Merrivale?"

"Three—two boys and a girl."

"That's fine. I congratulate you."

"Thank you. You must come out and see them some time. Everybody says they're the dearest little things that ever were. I must tell you what my oldest boy—Harry—said when his father came home late last night."

"Was Mr. Merivale late last night?"

"Late to dinner, I mean. Oh, he was all right. Harry met him at the door and said: 'Papa, you ought to be ashamed of yourself. We've been waiting more than half an hour for you.'"

PROUD MAZIE AND THE TYPEWRITER.

Mazie could write, and she could spell,
  Shorthand she'd learned from books,
But when she tried typewriting—well,
  a o
  iT$ h dEr Thani tl oks ?
  r

"That spacing don't look right," she said,
  "I wonder, wonder whether—"
As a result of being afraid,
  sheranthewordstogether.

Misfortunes never singly come,
  Nor typical mishaps:
The wrong key, pressed by Mazie's thumb,
  *95 5=8$, instead of CAPS.

And then things went from bad to worst
  As Mazie with a frown
Put in the paper wrong end first,
  And (YpEwroOte upside-down.

"If type-machines thus disobey,"
  Said she, "it's no use fighting.
"I'll let it have its way, and say
  I do shorthand typewriting."

The Independent

Entered at New York Post Office as Second Class Matter
Publisher, Clarence W. Bowen
130 Fulton Street - - - - New York

A WEEKLY MAGAZINE FOUNDED IN 1848
One Year, $3.00 Single Copies, 10 Cents

Single copies over six months old, 25 cents. Postage to any foreign country in the Universal Postal Union, $1.75 a year extra; to Canada, $1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as those offered by any responsible agency.

An order for the change of an address should be received two weeks before the change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of the publisher's price any book reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with $1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. Even so, we cannot hold ourselves responsible for their return. Authors should preserve copies of their manuscripts.

Advertising rates will be furnished on application.

The President's Vetoes

MR. TAFT was clearly justified in vetoing the appropriation bill for paying the salaries of legislators, executive officers and judges because a majority in Congress had attached to it "riders" relating to other matters of importance. If the Commerce Court, created only two years ago, ought to be abolished, it should be ended by direct legislation in a separate bill. We are not convinced that the court should no longer exist, but if it ought to go, there should first be thoro discussion of the subject, and the bill dealing with the question should stand by itself. The provision establishing a seven years' tenure of office for employees in the departments at Washington deserved earnest and vigorous opposition. Such a proposition should have been in a separate bill, and the bill should have been defeated by majority vote or by veto. Mr. Taft's action deserves general commendation.

His vetoes of the wool and steel tariff bills were overridden in the House, but sustained in the Senate. Doubtless he was convinced, as he said, that the rates in the wool bill were not sufficient to manufacturer, and that the enactment of them would so seriously depress certain industries that a great many persons would be thrown out of employment. He was willing to sign a bill making considerable reductions, a warrant for these having been shown by the tariff board's report. Unfortunately, the board's report is not and cannot be exact in its indication of production cost differences. It permits several interpretations. One man may say that it allows the reductions of the vetoed bill; another may say that it does not; and both may be honest and conscientious in the estimate or opinion. The President's action, undoubtedly, was in accord with his honest judgment. He was convinced, also, that the reductions proposed in the steel bill were so large that they would seriously affect and depress a great and important industry, and that they had been arranged unscientifically, without due regard to the sequence of processes and to past legislation. Here again we are confident that he was conscientious in the discharge of his duty. But it must be admitted that a considerable reduction of duties in the iron and steel schedule could safely be made.

It is unfortunate that by reason of these tariff vetoes the President should seem to be opposing the demands of a majority of the people and to be preventing a reduction of the cost of living. Such, in the minds of many, is the effect of his action. The tariff propositions of the Democratic party in Congress are acceptable to them because they affect, or promise to affect, the cost of living. Unquestionably, there should be a reduction of the tariff, but the leaders of the Republican party have been placed in a position where they appear to the public to be preventing it. They would consent to and work for a reduction at the present time, but their reduction would be less than the Democratic reduction and would be made with respect to an economic doctrine which the Democrats reject. The political and other difficulties of the situation, as affecting the Republican party, have all grown out of the colossal blunder of the revision of 1909, a revision which was promptly condemned at the polls, and for the correction of which the party has since been able to do little or nothing.

The Worst Opprest

RAILROADS—some railroads—oppress the people. Certain big corporations, trusts, oil trust, tobacco trust, steel trust, beef trust and dozens of others, large and small, oppress the people. Granted; how do they oppress the people? By monopolies that crush competition and create high prices to the advantage of the owners in the corporations and to the disadvantage of those who must buy the goods. The party platforms denounce the high prices and those who are responsible for them. Those who suffer are all of us, who are opprest because we have to pay something more than we like or ought to pay for railway tickets, oil, beef, cigars, etc. It is a real oppression—not the worst that can be imagined—and we complain of it, and the political men make the most of it, as they properly may.

There are others opprest because the price of their goods, namely, their labor, is not high enough. They are the men in labor unions, or many of them, who demand, and often justly, an increase in wages or less work given for their present wages. They make a living, but not as good or easy a living as they would like or ought to make. They too are opprest. It is a real oppression, but not the worst that can be imagined, yet something substantial, something to strike against, and we complain of it, and the politicians make the most of it, as they properly may.

These are the principal sorts of oppression against which complaints are made. They have to do with money, with prices and wages; certain men managing to get more money than their share, and certain others getting less than their right. This includes the worst forms of oppression that we hear of, the toiling of women and children with overhours and under pay and night work. We choose to buy, and we choose to work for wages, but we feel opprest because we must pay more than is fair, or because we do not get money enough for our work. We support the President when he punishes an oppressive oil trust or sugar trust or tobacco trust even, altho we do not observe that it makes much difference in the cost of our sugar or cigarets; and we rejoice in the restraint put on railroads by State and national commissions, and we ask for more commissions of the same sort.

And yet there are worse oppressions than these, of which we hear very little in the platforms.

We are occasionally asked why we have so much to say about negroes and their wrongs. It is because they are one of the very largest elements in our population, and they are the objects of oppression very much worse than that suffered by any other large class of our people. If it is right to protest against other and slighter oppressions, much more is it a duty to protest against those terms of oppression inflicted on one-ninth of our fellow citizens; for fellow citizens they are, and of native birth, real Americans.

Do we ever hear of an attempt to prevent other citizens from voting, or even the proposition to exclude them from the ballot? Never; but in a dozen States constitutions have been altered and laws enacted for the definite, confest purpose of keeping negroes from voting. They declare it must be a white man's government, and that black men must have no part in it. They must not hold office and must not take part in choosing the men to rule over us. We do not thus oppress the members of white labor unions, nor the immigrants. They can combine and vote as they please and elect their candidates. In a dozen or more States that is not allowed to the black man. Would not the labor unions howl, and justly, if laws were made to shut out their votes, and if the enrollment clerks refused to accept their names? This is vastly worse than the extra pennies on oil and beef.

Do we ever hear of laws past to the effect that carpenters or masons or railroad men cannot sit with lawyers and bankers in trolley cars or railway coaches? Would they not complain thru their unions if they could not travel in the sleeping car, or take as good a seat as they could pay for in a theater, or a good room in a hotel, or buy a house in a choicer section of the city, or send their children to the best schools? Yet in many States all these things are forbidden to negroes, even to the most de-

cent and intelligent of them. In traveling they cannot sit in the waiting room, nor eat in the restaurant at the station or in the dining car. What would our oppressed white men say if they were thus treated? Would not their present oppressions seem very slight in the comparison?

We hear of many scores of negroes lynched every year for all sorts of offenses, not all in the South either. White men are guilty of equally bad crimes; but we very seldom hear that they are murdered for it by a mob. Lynching is reserved almost wholly for negroes, as if the law was too good for them. What would white men say if white men were the victims? Would they not think their present oppressions small in the comparison?

Let us take a broad view. Let us consides all our people, all of whom should have a fair and equal show, with the law helping each to rise up to the limit of his powers, and no law holding him down. If colored men are treated far worse than white men, worse than any class of white men, then let us not shut our eyes to the greatest wrong of oppression prevalent in this country, and never fail to protest against it. It is not because THE INDEPENDENT was founded as an anti-slavery journal, nor because we are bigoted on the subject, but because we try to see things as they are and in their right proportion. Therefore the greatest wrong, the worst oppression of which our country is guilty, we must oppose and condemn.

Fortunately after thirty-five years of political silence, in which it was thought that the negro must take care of himself, we began to see a change. The negro is being heard of in this campaign, and he will make himself heard of in the States where he can vote. He will resent injustice and the politicians find he must be considered, for he has votes enough to be an important factor. He will vote for the party that treats him best. Fifty thousand negro voters in New York, as many in Illinois, half as many in Indiana, 70,000 in Pennsylvania, are a factor to give concern to the parties, even if Mississippi and Louisiana and Georgia flout equal democracy.

And there is a new demand even in the old Southern States, or some of them, for better justice to black men. Take these cases in Tennessee of late. A negro criminal was abused in a quarry gang by a white guard and actually died. He was brutally forced to labor when ill. All Nashville papers treated the case as fairly as if the victim had been white. They published facts generously and wrote editorials containing no *ifs* and *ands* about color; nor did they in a cowardly manner keep silence. There was another case of a brutal murder by two young white men of a defenseless colored farmer and two children. Their trial went straight thru to the bitter end with no regard to color, and the two youths were hanged, just as if they had killed white people, and the community approved. The square deal, in fair courts, for all citizens, is what we ask, with no exception for color. We are coming to it, but are yet far from it. The negro is still by far the worst oppressed element in our population, and the correction of the wrong claims precedence over all other reforms.

The Eugenics Congress

IT is not often that the promoters of a new movement, academic or practical, can be congratulated on their first efforts without a good deal of mental reservation. That a vigorous attempt to create a popular interest in the problems of eugenics should be an exception to the rule could not have been expected, for the subject offers large opportunities for self-advertising to the cranks and the faddists, not to mention more objectionable characters. Somebody is entitled to generous praise, therefore, for the fact that the first International Eugenics Congress, held at the University of London, July 24 to July 30, was an eminently dignified and reputable affair, as well as an exceptionally interesting and practical exchange of views.

The men connected with it were of the right sort. The president was Major Leonard Darwin. Among the vice-presidents, in addition to distinguished biologists, were Lord Avebury; Sir Archibald Geikie, president of the Royal Society; Sir William Osler, Regius Professor of Medicine at Oxford; Sir William Ramsay, and from America, ex-President Eliot, of Harvard; President

David Starr Jordan, of Leland Stanford University; Dr. Alexander Graham Bell and Hon. Simeon E. Baldwin. The papers, which make a volume of 490 compact pages, are an impressive body of reports of experimental studies and statistical analyses, in which the proportion of speculative application and of hasty generalization is astonishingly small. They are grouped in four sections, designated respectively as "Biology and Eugenics," "Practical Eugenics," "Sociology and Eugenics" and "Medicine and Eugenics."

Of individual papers two that seem deserving of particular mention, because they go far to clinch the eugenics argument, are by American contributors, namely, one on "The Inheritance of Fecundity," by Dr. Raymond Pearl, biologist of the Maine Experiment Station, and "Some Interrelations Between Eugenics and Historical Research," by Dr. Frederick Adams Woods, of the Harvard Medical School. The extensive experiments recorded by Dr. Pearl have apparently placed beyond all doubt the conclusion that fecundity is inherited strictly in accordance with Mendelian principles, and that therefore the question as to what stocks shall ultimately overspread and occupy the earth will be determined by biological forces (either left to themselves or consciously selected by man) and not at all by environmental reforms. The researches of Dr. Woods, while not so conclusive, establish an extremely strong probability that quality also, as well as fecundity, is a Mendelian phenomenon, with which environment has nothing to do except as it influences selection.

Such results of investigation as these and other papers in the volume set forth incline the open-minded reader to take seriously the thoughtful appeal of Major Darwin in his presidential address. With full recognition of the enormous amelioration of the human lot which mankind in the present generation owes to its improved surroundings, Major Darwin reminded his hearers that "our instincts, selfish and unselfish, may be trusted to ensure a large amount of attention being always devoted to the factor of environment in the evolutionary process," while we are in danger of neglecting the processes of heredity. And this danger increases with every step in civilization, which substitutes artificial arrangements for the conditions under which nature works.

"The unfit amongst men are now no longer necessarily killed off by hunger and diseases, but are cherished with care, thus being enabled to reproduce their kind, however bad that kind may be." We glory in this pity for suffering, and "the spirit which leads to the protection of the weak and afflicted is of all things that which is best worth preserving on earth."

Civilization thus creates a dilemma which civilization must meet. We cannot go back to the crude methods of natural selection, but the failure of selection threatens civilization itself. The alternative is conscious selection, which has become a paramount duty of society.

In Major Darwin's judgment society can no longer shirk this duty on the plea that we do not yet know enough about the laws of heredity to attempt a conscious selection. If we should tell the breeders of cattle "that their knowledge of the laws of heredity is so imperfect that it is useless for them either to attempt to avoid breeding from their worst stocks or to try only to breed from their best stocks, why, they would simply laugh at us." The first step to be taken, as Major Darwin sees it, is to establish such a moral code as will ensure that the welfare of the unborn shall be held in view; and it is his judgment that an intelligent conscious selection is destined to become the decisive factor in the future rivalry of the nations of the earth. That nation, he says, "which first takes this great work thoroly in hand will surely not only win in all matter of international competition, but will be given a place of honor in the history of the world."

The Supremacy of Christianity

EVER since the appearance in THE INDEPENDENT of June 5 of an editorial on "The Menace," we have received a succession of letters, not a few anonymous, informing us of our ignorance as to the danger that the "Romish" Church would strangle our liberties, and enclosing for our instruction copies of a blood-curdling oath said to be taken by Knights of Columbus (if not by Jesuits) who have

reached a certain high numbered degree in that order, and protesting that we have been fooled by our silly credulity. One of these letters affords us a proper text for comment.

The writer signs his name like a gentleman, and his handwriting indicates the scholar. He sends us an extract from a sermon by Dr. D. S. Phelan, and says:

"What do you think of that? If a Protestant had said such things about your Church you would draw your two-edged sword and dance on his flayed body."

We are not so easily excited or affrighted as the writer imagines. But what does Dr. Phelan say?

"Why is it everybody is afraid of the Catholic Church? And the American people are more afraid of her than any people of the world. Why are they afraid of the Catholic Church? They know what the Catholic Church means. It means all the Catholics of the world; not of one country, or two countries, but all the countries of the world. And it means more than that: It means that the Catholics of the world love the Church more than anything else, that the Catholics of the world love the Church more than they do their own governments, more than they do their own nation, more than they do their own people, more than they do their own fortunes, more than they do their own selves. We of the Catholic Church are ready to go to the death for the Church. Under God, she is the supreme object of our worship. Tell us that we think more of the Church than we do of the United States; of course we do. Tell us we are Catholics first and Americans or Englishmen afterward; of course we are. Tell us, in the conflict between the Church and the civil government we take the side of the Church; of course we do. Why, if the Government of the United States were at war with the Church we would say tomorrow, To hell with the Government of the United States; and if the Church and all the governments of the world were at war we would say, To hell with all the governments of the world. They say we are Catholics first and Americans decidedly afterward. There is no doubt about it. We are Catholics first and we love the Church more than we love any and all the governments of the world. Let the governments of the world steer clear of the Catholic Church; let the emperors, let the kings, and the presidents not come into conflict with the head of the Catholic Church. Because the Catholic Church is everything to all the Catholics of the world; they renounce all nationalities where there is a question of loyalty to her. . . . There need be no misconceptions there—the Catholics of the world are Catholics first and always; they are Americans, they are Germans, they are French, or they are English afterward."

Well, what of it? It is good, strong writing, and *mutatis mutandis* it is true, and we should say the same.

Dr. Phelan is editor of the St. Louis *Western Watchman,* and he likes to poke up the menagerie and hear the animals growl. We never mind the savage things he says about non-Catholics, for it is half in fun. But this is a sermon, and he is serious, and, believing as he does that the Catholic Church is *the* Church of Christ he can say nothing less.

The Christian Church was very young when it laid down the truth that it is better to obey God than man, even tho "man" represented the government. THE INDEPENDENT was in its youth when William H. Seward repeated the lesson of the "higher law" of Christianity as against the Fugitive Slave Law enforced by the President of the United States. The Church of Christ, so far as it represents Christianity, is supreme to every Christian, simply because God is more than man. It is a principle that is older than the Christian Church, that is recognized in stoicism, that appears sharply in the martyrdom of the seven holy children and their mother in Maccabean persecutions, and later, in the death of tens of thousands of martyrs down to the terrible persecutions in Madagascar and in the Chinese Boxer outbreak. If Dr. Phelan regards the Catholic Church as the true Christian Church, and the voice of the Church as the voice of God—and he does—then he is bound to obey it before any human government. He is bound to be a Catholic before he is a patriot. He must say with John Quincy Adams:

"If, then, thy country trample on the right,
Furl up her banner and avert thy sight."

Dr. Phelan's one error must be pardoned, altho it is a serious one. He assumes that the Catholic Church is the one Christian Church and that the Catholic Church cannot err, because it is the voice of God. The ecclesiasticism of the Church he makes of the essence of the Church; pope, bishops and all, all ordained of God. Believing so he must love it, just as those of us who are Christians but not of the Catholic communion, love the Church of Christ, and put it before presidents and kings, congresses and parliaments, and will at any time dis-

obey our country's laws when they contradict the law of Christ given to his Church. As Christians we hold that the Church is the highest power for good in the world, its highest blessing, its supreme guide, and we love it more than we love our country, and would sooner die for it.

But Dr. Phelan is mistaken if he thinks we fear the Catholic Church. A few timid, doubting souls do, but most of us see in it not a menace but an aid to what is honest and of good report—not all good, but chiefly so. And what is of error in it we expect will be dropt as superstitions are being dropt. We do not fear it because we have faith in the power of the truth and the supremacy of Christianity.

Black and White

To hear colors and to see sounds is an experience not vouchsafed to most of us. Yet we all do something of the same kind that is quite as remarkable, we ascribe colors to the ethical qualities. Universally do men call goodness white and wickedness black. Angels and devils, wherever they appear upon the surface of the earth, are clothed in these colors with an appropriateness that seems to be instinctive and inevitable. White may be the color of mourning as it is in China. Black may be the garb of respectability as it often is with us. These are matters of custom. But when it comes to ethics all men see alike and never confuse black and white. To turn from the power of Satan unto God is to turn from darkness unto light.

Wherefore this certainty about what no man can prove? Who has seen goodness that he can tell us whether it be black or white? If we are endowed with an ethical sense which some dispute, the eyeball is at any rate not the organ of it. What reason is there for ascribing whiteness to goodness? None whatever. But when we reverse the question, and ask is there any reason for ascribing goodness to whiteness, we see at once that there is.

For black is the most selfish of colors and white the most unselfish. They correspond then exactly with our conceptions of vice and virtue and the association of ideas is inevitable, since our highest ideal of goodness is perfect unselfishness, absolute altruism. "Freely ye have received, freely give" is the injunction of the Master. The white object obeys it literally. All the light rays it receives, whatever their kind, wherever their source, these it returns in full measure, undiminished, unimpaired, equally, and in all directions. But the black object does just opposite. What comes to it, it keeps. Blue rays, red rays or any rays between, all the colors of the rainbow, all that give beauty to the world, when they come to a black surface are absorbed and are seen no more. Never again will they flash about to gladden the sight and enlighten the mind. Their doom is forever sealed. For over the black portal is written, "Ye who enter here leave hope behind." Black is the Mephistophelian color. It is the Spirit That Denies. It is that which retains, destroys, annihilates.

Our common parlance is wrong from the point of view of the physicist. For black is to him not a color, but the absence of all color, while white is a color, *the* color, for it is all colors. A similar mistake was made when the electricities were named. It now seems likely to turn out that "negative" electricity is the only electricity there is, and "positive electricity" is merely the absence of it. So light is the real thing; pure disembodied energy, ever in motion, swifter than aught else can be, flying thru empty space without retardation or deviations. But black is nothing but the place where light has been stopped and killed; every black object is its funeral pile.

"How far that little candle throws his beams!
So shines a good deed in a naughty world,"

mused sentimental Portia, having doffed her lawyer's robe. A trite thought, because a true one, that virtue is always to be distinguished by its activity in radiation, by the brightness and penetration of its beams, by its effects upon its environment. It is, at any rate, the best text we have of goodness. The particular virtue Portia had in mind—was it Antonio's generosity to Bassanio or her own skill in foiling Shylock?—gave forth its full one candle-power of light. But many a 16 c. p. incandescent or 1,000 c. p. arc fails to live up to its rating

when measured by this ethical photometry.

A bad deed cannot radiate. At most it is a stain, a blot, which only becomes visible by contrast, which must depend upon its eternal antagonist to give it existence. Its influence is local, for the reason that it is essentially ungenerous. Its blackness is confined to itself. It has no power given it to shed darkness upon surrounding objects, as everything white or colored has of making all things about it more like itself.

There is, strictly speaking, neither black nor white in this world of ours. There are merely things darker and lighter and variously colored. We all specialize in the virtues, devoting our attention to such as suit our purposes. Some of us favor the lower end of the moral spectrums and display the red badge of courage. Others cultivate the more delicate vibrations of the blue end, purity, constancy and truth. Most of us are prismatic and changeable, flashing forth sometimes one color and sometimes another; perhaps in the course of a lifetime giving them all, but never all at once and equally in all directions. For the best of us reflect brokenly and partially what comes to us from the Supreme Source of all goodness.

Eliminating the Middleman

THE very great increase in the number of middlemen, and the growth of a system, whereby the farmer's productions must be repeatedly handled, each time with additional charges, before reaching the consumer, is at least one of the causes of the very high cost of living. The railroads have taken a notable stand in co-operation with the farmer, to secure largely increased crops, their corn trains now constituting a very prime factor in the improvement of agricultural methods. The Bessemer & Lake Erie Railroad announces its determination to take a hand in the marketing of the farmer's goods. It will establish at Pittsburgh a market house and a capacious cold storage room in connection with it, where producers may directly meet consumers, with the view of "eliminating the middleman and reducing the cost of living." Cars will be attached to morning passenger trains, thru all the country districts around, to convey garden stuff and orchard fruits as regularly and as quickly as possible to the market. Let us suppose this plan carried out and adopted as a rule by the railroads of the country.

It will greatly extend the suburban circuit of supplies for any city that comes into the plan. At present the shipment of perishable goods does not draw upon a circuit whose diameter is more than 25 or 30 miles. In a few cases, where roads are peculiarly favorable, this diameter will be 40 or 50 miles; that is, the grower of truck will drive 20 miles to his city customers. Plainly these market enlarged circuits will cut into each other even at this size, and when they become 75 or 100 miles in diameter they will intrude on each other very extensively. The main difficulty now with the local grower is the extended competition which railroads allow. The currant grower in Central Ohio finds market in Central New York. His goods being somewhat injured by long carriage, do not hold up the market price, and going down, they carry a better grade of goods with them. The strawberry grower at Ilion, N. Y., places on the Utica and Albany markets the best possible goods. He is, however, anticipated by growers in Florida, and close after by those in Virginia, and then by those in New Jersey and lower New York; and at last our Ilion farmer must take what prices repeated competition allows him.

It is very clear that railroad markets being opened, with rapid carriage, will not help this man in Ilion. When it comes to the grapes, those sections which can grow with the least cost will cut our New York grower entirely out. One result that will follow is this, that everywhere the farmer must be studying what he can most easily grow, with the least cost and the least competition. If a small fruit grower can find something that cannot be carried a great distance and brought into competition with his own production, that is plainly what he will have to grow. Where the strawberry competition brings prices down below compensative prices, the garden must be given over to red raspberries

possibly, which cannot be carried a long distance. There are a few crops, however, that will not be seriously affected in the way we suggest. Apples, we imagine, will suffer very temporarily, simply because, however thoroly distributed, the apple crop does not nearly meet the demands of consumption.

On the other hand, the apple gives us a very admirable illustration of the advantage of this new system. At present every farmer who is growing his crop at a point too far from market for personal carriage is obliged to let the middleman do precisely as he pleases with his apples, or he must let them rot in his orchard. It is an unfortunate fact that millions of bushels do mostly go to waste every year—enough to decently supply the city crowd and give the poor people once more a reasonable supply of "orchard bread." Distant competition may temporarily injure a local market for gardeners, but it cannot seriously affect any such crop as apples or wheat or corn.

The stimulus given by these railroad market adjustments will be well worth the while, in the way of making growers alert, tactful and accurate. They will have to be up in the morning, with all arrangements completed on time, and their selections and assortments for shipment must be such as will favorably touch the market. Instead of the middleman to deal with the grower will still have the marketman to deal with. He cannot go from house to house, finding his private customers and establishing with them personal relations. We shall never get rid of the necessity of trusting somebody unless we live within a very short radius of a good sized town.

But the middleman system that exists at the present time is injurious to the grower more from the prices he has to pay than for the prices he has to take. If he wants a barrel of flour from the Quaker Oats Company he cannot buy it direct. He must apply to the wholesale dealers, who will refer him to the jobber, who will refer him to the retailer, and finally after paying each one of these handlers he is able to get his goods. It is clear that he has paid enough, he and the rest of us, to support four men instead of one. Now if there be any way whereby he can get his flour or his cracked wheat directly from the grower, or even directly from the miller, he has got rid of two important members of the system.

The middleman who handles goods sent directly to him, from orange groves or apple orchards, should return a fair compensation, and is surely a very important factor in the production and distribution of food supplies. Is there any way whereby the grower shall make sure that he is placing his goods in the hands of a conscientious man? There is no question at present but what prices are crowded down, and occasionally boosted high, without any consideration of supply and demand. Our markets are very largely under the control of speculation. What has been said of the general farmer is true of all classes of producers, that they are liable to get about one-third of the value of the goods they create.

The National Grange places the farmers' chances at 35 per cent. This is rather high, for in some cases the grab or the waste is almost total. We have recently seen records of carloads of oranges netting fifteen cents to the box to the grower. It is impossible to trace these goods in such a way as to give the orchardist any knowledge of his fruit after it leaves his depot. On the whole we believe the railroad market house and cold storage room is going to prove to the long distance shipper of great value. The whole business can be placed in the hands of an agent, who can be easily kept under supervision. Instead of scattered middlemen by the hundreds, the business will be concentrated where it can be controlled by the producers.

However, we must not overlook the statement by the railroads, that this new movement is intended to have a specific effect on prices to the consumer; that the intent is to lower the cost of living to the city crowd. This does not necessarily mean lower prices to the grower, but less waste in transport. The profits that now go to the mere manipulators it is intended shall revert directly to the producers. The tendency will be greatly to prevent waste; waste at the garden end and waste at the market end. Carriage will be prompt, and cold storage

will put an end to rot when there is a glut. Shorten the circuit between wheat fields and bread eater; shorten the circuit from the apple orchard to the apple pie dinner; that is the philosophy of the new movement. Prevent waste and eliminate the middleman. The philosophy is good if it works out well in practice. At any rate, we are entering on a new market system, a system as sharply modifying the old ways as our fathers' local swappings were changed when railroads began to carry produce a thousand miles, from the farmers' fields to unknown consumers. The grower and the producer are coming nearer together once more; and the end is not in sight.

Another Cancer Cure

THE announcement from Paris that Dr. Gaston Odin has discovered and succeeded in isolating and cultivating the microbic cause of cancer naturally attracts wide attention. Cancer is the most important, most fatal disease we have, and is unfortunately, besides, the inevitable cause of more suffering to the human race than perhaps any other affection. At the present time, as indeed for many years now, cancer has caused more deaths than all the infectious diseases put together. That is, it causes a greater mortality than typhoid fever, smallpox, scarlet fever and all the so-called children's diseases and yellow fever and the various continued fevers. Tuberculosis is more fatal and pneumonia is now the "Captain of the Men of Death," to use Defoe's striking expression, but cancer is deservedly the most dreaded and the most hopeless of human affections.

While the mortality from all other diseases has been decreasing, that from cancer has rather been on the increase. This increase is more apparent than real, and is due to the fact that more people now live to the cancer age. While cancer may occur under thirty it is very rare at that period of life, but every decade after thirty provides more and more victims. We have reduced the mortality among children and young folks from the ordinary microbic diseases of childhood and of early adult life, and nature balances the account by taking off the grown-ups a little bit after middle life. All the degenerative diseases—cancer, kidney and liver disease—have become more common and more fatal in the decades after forty, because many persons possessed of comparatively low resistive vitality who used to die in early years from the disease dangers of childhood and early youth are now saved by our improved sanitation, but are not able to stand the strenuous existence of middle life, and succumb to the various degenerations of tissues and organs which represent, as it were, a premature old age.

Dr. Odin's discovery is said not to be a bacterium, but an amœba; that is, it is not one of the vegetable micro-organisms which are so familiar to us as the causes of disease, but one of the very low animal forms, perhaps a protozoon. This micro-organism is said to exist in large numbers in the blood of patients suffering from cancer. The amœbæ are very nearly like white blood cells, and according to Dr. Odin the cancer amœba is a flattened, apparently gelatinous mass, quite irregular in outline, with deep indentations, as if it had torn edges and a central nucleus. This is described as the primitive or static form. When this organism takes on developmental proclivities it multiplies rapidly and its arms project still further and perhaps are loosened and become daughter organisms. This is the description of the parasite as we get it by cable.

There are many details of the description thus given that would make a pathologist hesitate as to the acceptance of any such announcement without the severest of tests and thoro control observations and experiments. The existence of white blood cells, some of which in the anemic states that so often develop in the course of cancer, easily furnish a deceptive ground work for a supposed parasitic discovery of this kind represent one fruitful source of error. Many of these white cells become somewhat shadowy in appearance, others of them grow larger than usual, nucleated red blood cells occur in the blood and add to the possibilities of deception and in general only the most careful critical elimination would save an observer from deception.

This new parasite is said to exist more or less free in the blood, yet cancer at

the beginning of the affection is always a strictly localized disease. It occurs with special frequency in the midst of tissue that has been undergoing severe irritation for a long time. It occurs particularly on the lips, where the irritation of a jagged tooth has been allowed to continue for a long period or on the tongue from a similar cause or from the irritation of the hot smoke and the roughened end of a short pipe, or on the lips of the cornet player. It follows certain occupations, because of the chronic irritation set up in the midst of these occupations. Chimney sweep's cancer, for instance, occurs in the folds of the body of those who are covered with soot and who do not care particularly for cleanliness and especially if they do not remove the soot from the folds of the person. Its constant presence sets up chronic irritation that leads to the development of cancer. Many hundreds of such cases have been observed. Workers in certain turpentine products and in paraffin suffer in this same way from the presence of irritant particles on their hands. The x-rays, which were thought to cure cancer when we first discovered them, are now known to cause it, and a large number of cases of x-ray burns followed by cancer have been reported.

Certain curious Oriental customs illustrate how cancer may occur as the result of chronic irritation even among people who eat very little or no meat. The inhabitants of certain northern districts in India have the habit in their climate, which is liable to great extremes of temperature—they live in the foothills of the Himalayas—of wearing a small charcoal stove in a girdle around their waist. The heat of the charcoal is applied directly to the skin surface of the abdomen. Cancer frequently develops among these peoples at this point, tho it is practically never seen here under any other circumstances. The Oriental peoples who chew betel nut suffer from cancer of the tongue. They mix the nut with certain eastern spices that are very hot and the nut itself is intensely irritant, and the consequence is cancer from the frequently repeated irritation of the tongue. The Chinese in certain districts eat their rice very hot and tho they live exclusively on rice they develop cancer. The idea sometimes advanced that meat eating has anything to do with the development of cancer is entirely eliminated by the statistics published by Japanese physicians as to cancer among the vegetarian Japanese, who suffer from it in quite as great a proportion as the Occidentals.

Just how Dr. Odin's new parasite for cancer would fit in with these well-confirmed observations is a little hard to see. It is not impossible, of course, but it is at least improbable. On the other hand, we have had at least twenty announcements of the cause of cancer made during the last twenty years by serious scientific investigators, and all of them have proved mistakes. The discovery would be so important that the ardent endeavor to secure it easily leads to self-deception in observation. The scientific world is very sceptical and only the most careful, prolonged investigation and thoro confirmation of the observations would satisfy it. The temptation to make a reputation by the announcement of a cancer cure that news items that come thru irregular channels, may be rejected at once.

In the meantime there is one unfortunate sequela of all such announcements. They lead patients afflicted by cancer to put off the only known curative measure that we have for cancer—unless it is strictly localized on the skin surface, when caustic treatments may do good—and that is, surgical eradication of the malignant tumor. When this is done early in the case, considerably more than half the patients live out their lives without having existence shortened by their cancer or they die from intercurrent disease. Unfortunately, as the report of the State Board of Health of Pennsylvania showed not long since, more than half the cases of cancer that come for treatment have delayed application to a physician until there is a serious question whether operative intervention will be successful. Some time we may get a new cure for cancer. Probably that will not come till we know the cause for it. We may be in the presence of the first information with regard to both cause and cure in the present announcement from Paris, but that seems unlikely. We shall have to wait for the regular scientific course of critical investigation to determine that.

A Bergson Lecture

In the article on Henri Bergson which we published June 8, 1911, mention was made of the astonishing popularity of his lectures on philosophy. This is confirmed by the following lively description, translated from the Paris *Temps,* of a scene at the opening of one of his public lectures at the Collège de France. If Professor Bergson draws as well in New York as he does in Paris, when he comes here next fall, Columbia University will have to hire Carnegie Hall:

"In this twentieth century, which sees the multiplication of new dynasties of triumphing kings of steel and oil, philosophy, which yields no dividends, might seem to take a back seat And yet—an extraordinary thing and a real—it still has its believers. To make sure of this one only needs go, on a Friday afternoon, to the Collège de France, where M. Bergson speaks on creative evolution or on the idea of personality. An hour before the lecture-time, the seats of the amphitheater—or rather of the little chapel—are peopled by a pious and diligent flock. Some seats are empty, but they soon fill up. Already all the places are taken, but those pushing in, still good naturedly, discover new ones. Then elbows become less accommodating; dart their sharp points into the breasts of the friends of learning. Those crowded protest, and the uproar swells. In these last moments, the philosophy which triumphs at the doors is that of the Darwinian struggle for life. The doors creak now under the desperate effort of the belated. But the philosophical backs of the first-comers sustain the shoving with a victorious energy. Come too late into a room too full, those hungering for the new learning are reduced to herding in the corridors and seizing from afar some words, as, for example: The dynamic scheme, the symbolism of concepts, creative activity, discontinuous attention, a vague nebulosity, virtual personalities. . . ."

The Last Sigh of the Moor

Mulai Hafid, the last independent sovereign of Morocco, has abdicated and gone to Paris, where he will spend his days and his retiring allowance in such pleasures as that city can provide to alleviate the lot of an exiled monarch. Morocco now becomes openly a protectorate of France and will be subjected to a process of "Tunisation." The ex-Sultan landed at Marseilles in excellent humor, paying for picture postcards in good gold coin, making blind beggars rich, and tipping everybody like a lord—no, we mean like an American millionaire. He says he never enjoyed the pleasure of automobiling so much as on the magnificent French roads, and he has ordered two cars for his own use. This passing of the Moorish power from Africa inevitably reminds us of the passing of Moorish power from Europe. Four hundred and twenty years ago it must have been, for Columbus was standing by, waiting for an audience, when Boabdil the Unlucky handed to King Ferdinand and Queen Isabella the keys of the city of Granada. The poor monarch took the loss of his kingdom rather more to heart than does his successor of the present day. Let us turn to the glowing pages of Irving's "Conquest of Granada" and read again the familiar passage:

"Having surrendered the last symbol of power, the unfortunate Boabdil continued on toward the Alpuxarras, that he might not behold the entrance of the Christians into his capital. . . . At two leagues distance, the cavalcade, winding into the skirts of the Alpuxarras ascended an eminence commanding the last view of Granada. As they arrived at this spot, the Moors paused involuntarily, to take a farewell gaze at their beloved city, which a few steps more would shut from their sight forever. Never had it appeared so lovely in their eyes. The sunshine, so bright in that transparent climate, lit up each tower and minaret, and rested gloriously upon the crowning battlements of the Alhambra; while the vega spread its enamelled bosom of verdure below, glistening with the silver windings of the Xenel. The Moorish cavaliers gazed with a silent agony of tenderness and grief upon that delicious abode, the scene of their loves and pleasures. While they yet looked, a light cloud of smoke burst forth from the citadel, and presently a peal of artillery, faintly heard, told that the city was taken possession of, and the throne of the Moslem kings was lost forever. The heart of Boabdil, softened by misfortunes and overcharged with grief, could no longer contain itself: 'Allah Acbar! God is great!' said he; but the words of resignation died upon his lips, and he burst into a flood of tears. His mother, the intrepid sultana Ayxa la Horra, was indignant at his weakness. 'You do well,' said she, 'to weep like a woman, for what you failed to defend like a man!' . . . From this circumstance, the hill, which is not far from the Padul, took the name of Feg Allah Acbar, but the point of view commanding the last prospect of Granada, is known among Spaniards by the name of El ultimo suspiro del Moro; or, 'The last sigh of the Moor.'"

A National University

It is curious to observe that the State universities, which might be supposed to be jealous of the establishment of a national uni-

versity, are, on the contrary, the most earnest advocates of it, while, as President James says: "Private institutions, religious and secular, have opposed, thus far successfully, the movement." A quarter century ago Governor Hoyt, of Wyoming, and the first president of the University of Wyoming, urged upon Congress the founding of a great university at the Federal capital in accordance with the wishes of George Washington. The bill now before Congress embodies the plan of the Association of State Universities for opening the doors of the scientific bureaus at Washington to advanced students. It is not intended to give undergraduate instruction or to confer degrees. Only students who already have the master of arts or science will be admitted, and having completed their research work they may return to the institution at which they previously studied to take examination for the doctorate and receive the degree. This is what is known as the "renvoi system." The members of the Government scientific staff would be required, as part of their regular work, to give a certain amount of instruction to the students. At present it is the private institutions of Washington and vicinity that get the benefit of their services. President Van Hise, in advocating the bill at the Chicago meeting of the National Educational Association, showed that the Government was now spending more than ten times as much for scientific research as any single university in the country, and that the library of Congress and the national laboratories and museums offered incomparable opportunities for advanced study, now mostly unutilized. He also points out very frankly that the Government scientific departments are not doing as much as they should for the advancement of knowledge. The United States Geological Survey, he says—and here President Van Hise can speak with authority—is accomplishing less for science with all its millions than it used to do when its income was a tenth of what it is now and the Naval Observatory, splendidly equipt tho it is, does not contribute to astronomy. This argument, however, is a boomerang and will doubtless be used by the opposition to prove that Government institutions are bound to be inefficient.

Few of us are able to emulate the generosity of Mr. Julius Rosenwald, of Chicago, who celebrated his fiftieth birthday by giving away $687,500 to educational and charitable institutions. But we fear that still fewer of us, if we had the money, would show so broadminded a spirit in bestowing it. He gives $250,000 to the Associated Jewish Charities and $250,000 to a Christian institution, the University of Chicago, in the latter case to go toward the erection of a classical building, a geological building and a woman's gymnasium. He also contributes to the support of the negro schools of Booker T. Washington, a tuberculosis sanitarium, a manual training school, and a country club for social workers.

The Populists complain that the Progressives have stolen eighteen planks from their platform, the Democrats six and the Republicans four, leaving only six, and these are too few to make a platform big enough for a candidate to stand upon. But if the Populists really originated them why did they not get them copyrighted?

Here it is near the last of August, and the appropriation bill still delays passage on which the veterans of the Civil War and their widows depend for support. Some are absolutely needy. It is the Senate that makes the delay, and there is no just apology for it.

During the year ending June 30, 1912, you drank 22 gallons of beer and 1½ gallons of whisky and smoked 125 cigarets. Or, if you didn't, somebody else got your share. Never mind. Let him have it.

Charles Becker, New York lieutenant of police, deposited in the savings banks $58,843 in nine months, and his salary during that period was only $1,687. What a blessing it is to have a saving wife!

If you can't think of any further charge to bring against your opponent just say that he or she is lacking in a sense of humor. It is a knockout blow, impossible to parry.

INSURANCE

Resident Agent Laws

PRESIDENT JOHN T. STONE, of the Maryland Casualty Company, has recently published an instructive paper on what are known in many of the States as "resident agent laws."

Briefly stated, these laws (which are in force in all the States and Territories except California and New York) provide, generally, that insurance companies transacting business within their borders shall make contracts of insurance covering insurable property located in those States only thru constituted and licensed resident agents. That is to say, by way of illustration, an agent residing in New York or New Jersey, may not issue a policy to a citizen of either of those States on any insurable thing he may own in the State of Connecticut, that privilege being prohibited by the resident agent law of Connecticut.

Mr. Stone defines the objects of these laws to be: First, to secure to the State the tax levied on premiums; second, to secure to agents resident in the State commissions arising from premiums paid on property located in the State; and, third, probably to protect the public against irresponsible companies. He regards the last consideration as of negligible value, "because such concerns do not pretend to comply with any of the laws governing the certification of companies, and those who patronize them know, or ought to know, that they are dealing with edged tools." He correctly asserts that the insuring public are protected at this point by other laws and regulations.

The matter of safeguarding the State's taxes on premiums is then discussed by Mr. Stone, and he clearly shows, by describing the system used by the companies at their home offices for making sworn reports to the respective insurance department of premiums received in each State, that the resident agent laws are not essential to this purpose.

The main object of these laws, then, is to protect the resident agent against the competition of agents and companies of other States. This effect is instantly neutralized by the retaliatory laws of the other States, and the resultant benefit, consequently, becomes of doubtful value.

As a general thing, the insurable risks actually involved in this question are those which are controlled outside the State and, principally for reasons of convenience, the insurance is effected thru the agents or companies nearest the person or persons attending to that business.

The president of the Maryland Casualty Company describes some of the difficulties which the class of insurers to which his company belongs have to contend with because of the existence of resident agent laws. He goes into this matter at some length, varying his illustrations by citing accident and health, liability, burglary, etc.

Touching the subject generally, Mr. Stone says:

> "By what code of morals or ethics can those who make such laws or those who profit by them justify a process which says to me: 'We are glad to have you invest your money in our State and to pay the city, county, State and other taxes; we are glad to have you employ our citizens and pay them a livelihood; we are glad to have you increase by your output the volume of our manufactures and commerce. You can buy your raw material anywhere and sell your finished product anywhere; you can deal with anybody regardless of where he lives—except that you cannot under any circumstances, no matter what your own choice or advantage may be, place your insurance with any agents other than those who live in this State.'"

"It is just as fair and just as sensible, no more, no less," he adds, "to enact a law forbidding one to buy or to sell any commodity used in his business unless he does so thru an agent resident in the State where his plant is located."

There is much force in the arguments presented by Mr. Stone, and they are abundantly supported by facts. There seems to be no good practical business reason for laws of this character. They multiply labor and cost, needlessly consume time at home offices, and are a source of irritation and annoyance. They obstruct the natural channels of business and do not, taking it by and large, particularly benefit the one class they seek to serve. The interests and convenience of the vast body of premium-paying citizens are made subservient to the interests of a small number of local insurance agents.

FINANCIAL

New Railroad Legislation

THOSE provisions of the Panama Canal bill, passed last week by the Senate and the House, which relate to steamships owned or controlled by railroad companies, affect the holdings of several great corporations, and if the bill becomes a law will compel a readjustment of not less than $100,000,000 worth of property. The bill practically compels a railroad company to divest itself of its steamships unless it can prove that its control of them does not exclude, prevent or reduce competition. The New Haven Railroad Company's investments in steamboats and property connected with the operation of them amount to about $25,000,000. In a company operating vessels on the great lakes the New York Central has from $3,000,000 to $4,000,000 invested, and the Pennsylvania owns the stock of a similar company capitalized at $3,000,000, with $1,500,000 in bonds. The Southern Pacific controls marine equipment valued at about $20,000,000, exclusive of its interest in the Pacific Mail. This property directly owned includes 21 vessels in service between New York and New Orleans. These are the leading examples of the ownership affected by the bill, and, as we have said, it is estimated that the value of all the steamship property involved exceeds $100,000,000. There are provisions also which affect the value, to a railroad company, of marine terminal property, upon which large sums have been expended. This is the opinion of the general solicitor of the Pennsylvania Road, who has in mind his company's terminals at New York. Legislation of this kind should be considered by itself and should be proposed in a separate bill. It should not be associated with legislation for Panama Canal traffic.

The Business Situation

TRADING on the Stock Exchange increased by nearly 40 per cent. in volume last week, and the net result was a gain. The promise of good crops continued to be the warrant for the general movement. In the steel trade there were additional increases of prices, and the Corporation's unfilled orders were shown to have been, at the end of July, 5,957,079 tons, an increase of 150,000 since June, and the largest quantity for any month since September, 1907. Said the *Iron Age:*

"The iron steel situation could hardly develop more satisfactorily to the producer, and the outlook has seldom been better, either for volume of business or for prices yielding a profit."

The annual crop and business report of the Continental and Commercial Bank of Chicago is always a statement of much weight. In this year's report, published last week, the bank is optimistic. The harvests, it says, will exceed those of last year by at least 20 per cent. in weight and bulk. It estimates the new wealth thus created at $9,033,966,000, against last year's $8,417,000,000. Reviewing the steel trade, it points out that higher prices have not checked demand, and its final julgment is as follows:

"Taking the situation as a whole, and weighing carefully the retarding influences, there is justification, judging from the advices in every line of trade, for the conclusion that there is ahead probably twelve months of good active business, with moderate profits, providing, of course, that our crops turn out as favorably as present conditions indicate."

....The Canadian manufacturers of boots and shoes have decided to increase their prices by 15 per cent. on September 1.

....Under the leadership of the Emerson-Brantingham Company, of Rockford, Ill., companies having plants in Minnesota, Missouri, Texas, Washington and elsewhere have combined, with a capital of $50,000,000, in competitive opposition, it is said to the Harvester Trust.

....Speaking of the recent merger of the Rio de Janeiro and Sao Paulo street railway and electric light companies, under a Canadian charter, with the main office at Toronto, the *Monetary Times*, of that city, says that in Mexico and Brazil companies directed from Canada have authorized $300,000,000 of stocks and bonds, of which about $240,000,000 has been issued.

The Independent

VOL. LXXIII NEW YORK, THURSDAY, AUGUST 29, 1912 No. 3326

Survey of the World

National Politics

At the recent primaries in Kansas the plurality of Roosevelt electors over Taft electors was 34,000. State elections are to be held in Vermont on September 3 and in Maine on September 9. Among those making speeches for Mr. Roosevelt are ex-Senator Beveridge and Judge Ben B. Lindsey. Speaker Clark has volunteered to speak in Maine for Governor Wilson, and among the other Democratic campaigners will be Governor Foss, Governor Marshall and Governor Baldwin.——Formal notification of his nomination was given to Governor Marshall in Indianapolis, on the 20th, by Alton B. Parker. During the latter's address the grandstand fell down and seventy-five persons were injured, five of them dangerously. The social condition which we call democracy, the Governor said in his response, was unalterably opposed to special privilege, and the mother of all special privilege was the high protective tariff:

"Men everywhere, looking upon the awful injustice of this economic system, are becoming socialistic in theory if not in conduct. And shall any fair-minded man say that if it redounds to the interests of the people of this country that a hundred men shall control its business to the good of every one, that there is anything fallacious in the theory that government, instead of transferring business to a favored few for the benefit of all, should itself discharge that business for the benefit of all? I do not hesitate to say that if it be impossible to restore this republic to its ancient ideals, which I do not believe, and I must make the ultimate choice between the paternalism of the few and the socialism of the many, count me and my house with the throbbing heart of humanity. . . . The voter who believes that the cost of production at home and abroad should be equalized to the manufacturer of this country and who wants an oligarchy to rule, may vote the straight Republican ticket; the voter who believes in a similar protective theory, but who prefers to an oligarchy that the President shall be the state, may vote the Progressive ticket; the voter who believes this Government should be turned into a socialism, may vote the Socialistic ticket; and all those who insist that it is not the business of government to equalize the cost of production at home and abroad to the manufacturer until it equalizes the difference in the purchase price to the consumer at home and abroad, who believes that the only equalization justifiable in our Government is the equalization of opportunity, who thinks that public office is a public trust, who does not believe that disgruntled and defeated politicians are genuine reformers, and who think that reforms are not born with sore toes, may vote the Democratic ticket. . . ."

Vice-President Sherman was formally notified at Utica next day. He said:

"Fortunate are we Republicans in the fact that our opponents are divided into two camps, rivaling each other in their efforts to excel in disturbing the civic and economic order of the country. The new party thrusts itself forward into the vacuum left by the phantoms of other third parties which have passed into oblivion. Oblivion, too, awaits it. The Democratic rallying cry has always been 'a tariff for revenue only,' and the bitterest assault on the policy of protection to American industry. This year sees no innovation. The Democratic candidate, Dr. Wilson, is Bryan and Parker over again without the oratory of the one or the legal training of the other, but with the free trade prejudices of both seemingly intensified. It is not unkind to discern that Dr. Wilson is a pedagogue, not a statesman, and his mode of thought academic rather than practical."

In a speech at Trenton, Governor Wilson said that those who were seeking special privilege in politics need not apply to him or the Democratic party. His nomination had been received without promises to anybody.——Mr. Roosevelt and Attorney-General Wickersham have been engaged in a kind of joint debate about the Taft administration's record

with respect to Trusts, the former asserting that the Standard Oil and Tobacco Trust decisions were ineffective or really beneficial to the defendants, and the latter saying that they were what Mr. Roosevelt's Attorney-General asked for, and that they are approved by Mr. Roosevelt's prosecutor, Frank B. Kellogg. Mr. Wickersham adds that there were only forty-four suits in Mr. Roosevelt's seven and a half years; that he finished only four of these which were important, and that there have been sixty-six suits under Mr. Taft.

Campaign Fund Contributions

Following the publication of a letter accompanying the payment of $25,000 to Senator Penrose by John D. Archbold, of the Standard Oil Trust, in 1904, much testimony has been given to the public and a bitter controversy has arisen. Mr. Penrose, speaking in the Senate, said that the money was sent to be used in the Pennsylvania Republican campaign; that Mr. Archbold also gave $100,000 to Treasurer Cornelius N. Bliss for the Roosevelt general campaign fund; that Mr. Roosevelt and Chairman Cortelyou knew of and approved the contribution; that in October Mr. Bliss asked for $150,000 more, which Mr. Archbold and the Trust declined to give; that William Flinn offered to him (Penrose) and Israel Durham $1,000,000, afterward $2,000,000, if they would procure his appointment to succeed Senator Quay; and that Mr. Van Valkenburg, an editor in Philadelphia now supporting Mr. Roosevelt, was indicted for bribery in 1896 and escaped conviction, owing to the leniency of Quay and others, and to the payment of $10,000 costs. He read telegrams (sent in cipher) in which Flinn had asked Archbold to help him get into the Senate. After this speech both Penrose and Archbold testified before a Senate committee, the former saying it was understood that Mr. Roosevelt knew of the Archbold contributions and of the demand for $150,000 more. Mr. Archbold corroborated Penrose, saying also that he told Bliss he would not pay unless the contribution was approved by Mr. Roosevelt; that such approval was inferred from Bliss's reply; that the refusal to add $150,000 drew from Bliss the remark that he was making a mistake; and that afterward the Standard Oil Company was unjustly and persistently attacked by Mr. Roosevelt's bureau officers, James R. Garfield and Herbert Knox Smith. Mr. Penrose also intimated that George W. Perkins had underwritten the movement for the nomination of Mr. Roosevelt this year to the extent of $3,000,000. This is denied by Mr. Perkins. Mr. Van Valkenburg says the bribery charge was part of a political plot against him; that he could not get a trial and that he paid no costs. Mr. Roosevelt produces a letter, dated October 26, 1904, in which he directed Cortelyou to return $100,000 if it had been contributed by the Standard Oil interests. He says Mr. Archbold has not told the truth, and he defends the late Mr. Bliss, who, he says, never spoke to him of such a contribution and was incapable of blackmailing a corporation. Mr. Cortelyou, he adds, asserts that he never heard of it. Mr. Penrose says the Cortelyou letter was an afterthought and was written for defense after the money had been spent. Mr. Roosevelt demanded a hearing before the committee, but, as he must wait several weeks, he will send a written statement. Mr. Hearst, the owner of several newspapers, who published Archbold's letter to Penrose, cables from London that the latter's testimony is not wholly correct; that he has more letters and other documents; that the committees of both parties solicited and received Standard Oil money, and that if those involved do not tell the whole truth it will be published.

Congress

In the closing days of the session, Mr. Taft vetoed the legislative, executive and judicial appropriation bill a second time, because Congress insisted upon abolishing the Commerce Court. In the House the veto was overridden again, but it was sustained in the Senate. Whereupon provision was made for keeping the court alive until March 4 next, and the bill was signed. Expectation of a veto caused the elimination from the army bill, of the paragraph which would have ousted General Wood from the office of Chief of Staff. This bill, as passed, provides that the term of enlistment shall be seven years, four in active service and three in reserve. For a parcels

post, the Bourne-Bristow plan, making eight zones, was adopted. Sealing at the rookeries of the Pribilof Islands was prohibited for five years. There was vigorous opposition to the nomination of Clinton W. Howard, to succeed Judge Hanford, of Seattle, who recently resigned. Senators Warren, of Colorado, and Bacon, of Georgia, have been renominated at the primaries. Congress intended to adjourn *sine die* at midnight Saturday, but controversies prolonged the day's session until 4.38 a. m. on Sunday, when adjournment until Monday was ordered.

The Panama Bill After a long session of the Cabinet devoted to the consideration of the Panama Canal bill, President Taft sent a message to Congress advising the passage of a joint resolution declaring that there was no intention to violate the Hay-Pauncefote treaty and opening the Federal courts to foreigners who may think themselves injured by it. The President expresses his own views in the following words:

"After full examination of the treaty and of the treaty which preceded it, I feel confident that the exemption of the coastwise vessels of the United States from tolls and the imposition of tolls on vessels of all nations engaged in the foreign trade is not a violation of the Hay-Pauncefote treaty. But distinguished lawyers in the House and Senate differ from this construction, and the Secretary of State has received an informal protest from the British Government that the contemplated legislation is a violation of her treaty rights

"I am sure that it is not the intention of Congress to violate the Hay-Pauncefote treaty or to enact anything inconsistent with its provisions, and that it certainly is not its purpose to repeal by subsequent enactment the treaty, in so far as it represents the law of the land. It is of the highest importance, however, that this attitude should be made clearly known to the nations of the world, and that we should avoid any apparent justification for criticism."

Mr. Taft signed the bill on August 24, at the same time giving out to the public a defense of his action, in which he argues that since there is nothing in the treaty that prevents Great Britain and other nations from extending such favors as they see fit.

"The British protest leads to the absurd conclusion that this Government, in constructing the Canal, maintaining the Canal and defending the Canal, finds itself shorn of its right to deal with its own commerce in its own way, while other nations using the Canal in competition with American commerce enjoy that right and power unimpaired.

"The British protest, therefore, is a proposal to read into the treaty a surrender by the United States of its right to regulate its own commerce in its own way and by its own methods, a right which neither Great Britain herself nor any other that may use the Canal has surrendered or proposes to surrender.

"While the bill here in question seems to vest the President with discretion to discriminate in fixing tolls in favor of American ships and against foreign ships engaged in foreign trade within the limitation of the range from 50 cents a ton to $1.25 a net ton, there is nothing in the act to compel the President to make such a discrimination.

"The policy of exempting coastwise trade from all tolls really involves the question of granting a Government subsidy for the purpose of encouraging that trade in competition with the trade of the transcontinental railroads. I approve this policy. It is in accord with the historical course of the Government in giving Government aid to the construction of the transcontinental roads. It is now merely giving Government aid to a means of transportation that competes with these transcontinental roads."

"I believe the bill to be one of the most beneficial that has passed this or any other Congress, and I find no reason in the objection made to the bill which should lead me to delay until another session of Congress provisions that are imperatively needed now, in order that due preparation by the world may be made for the opening of the Canal."

The Islands Our Government has protested against an employers' liability bill recently passed by the Cuban Congress, because it is hostile to the interests of American insurance companies in the island. It requires employers to insure their workmen in a local company hereafter to be formed, which would monopolize the business. A presidential veto is expected.——General Loynaz del Castillo published a letter saying that President Gomez, if he should seek re-election, would cause a bloody revolution and lose his own life. In reply there was given out at the palace a letter in which the President's son sought to draw from the general a challenge to a duel.——Santo Domingo's customs revenue in the past year was $3,293,980, about half of which was set apart for the foreign debt. The revenue was larger than ever before. This was the fifth year of American supervision.——A commission sent to Hayti last week by Santo Domingo was most cordially received, and

friendly relations have been restored. A schooner load of rifles for Haytian rebels was seized at Kingston, last week. It appears that rumors of a plot for the destruction of the Haytian President's palace were current for several days before the explosion and fire on the 8th, which caused the death of President Leconte. He had been warned.

The Revolution in Nicaragua

In answer to the urgent requests of our Minister in Nicaragua, President Taft is sending more marines to that country, together with the available cruisers and gunboats. By the end of this week there will be 2,100 marines and sailors at Corinto and Managua. The rebels are carrying on a war of great barbarity, and the Nicaraguan people's hatred of Americans is said to be intense. On the 19th, the rebels, under General Zeladon, captured the city of Leon. The garrison of 600 men surrendered, and while they were prisoners of war all of them (three or four men excepted) were slaughtered. Two of the victims were Americans. They had been wounded and were on their way to a hospital. In other places the rebels have killed women and children in churches and patients in hospitals. Minister Weitzel reported on the 19th that a thousand unburied bodies of soldiers were lying in the fields near Managua. General Zeladon and General Mena do not agree, and it is said that Mena is now held as a prisoner by the Liberal revolutionist faction, which Zeladon represents. The latter has promised his soldiers that they shall sack Managua, the capital. Mena was at first the leader of the revolt. In some way he had obtained 20,000 good rifles, altho the number of his men did not exceed 5,000. Corinto, the Pacific seaport, is menaced, and rebels hold places on the line from that port to the capital. Volunteers patrol Corinto streets. The women and children of the city sleep on board the American warships. The revolt has spread to the east coast, and marines have been landed at Bluefields. ——In the Senate, on the 21st, Mr. Bacon, Democrat, attacked our Government's course, saying that the navy was being used improperly to accomplish indirectly what had been sought by means of the unratified loan treaty. He asked for an investigation. On the other hand, Representative Sulzer, Democrat, chairman of the House Committee on Foreign Affairs, warmly commends the action of the Government. Realizing the peril of Americans and their property, and the barbarity of the rebels, he rejoices, he says, because our Government has acted promptly. At the end of last week there were 450 marines in Managua.

Mexico

The Federal army, about 2,500 men, entered Juarez on the 20th. Two days earlier a woman clad in khaki and riding a white horse came into the town leading ten rebel soldiers, disarmed the chief of police and six of his mounted men, took their horses and rode away. It is said that she is the wife of one Alanis, a rebel colonel. Orozco, going westward, is far behind the greater part of his army, and at the end of last week the Federals expected to capture him. His men have been burning railroad bridges. They hope to reach Guaymas. The Southern Pacific Railroad Company, whose Mexican line has suffered, asked our Government to send a gunboat to that port. Constitutional guarantees were suspended on the 24th in Chihuahua, Durango, Sonora and several States near the capital. This caused reprisals. Two citizens of San Juan (Durango) who went to meet a rebel force as peace envoys were hanged by the feet and shot to death. Orozco's men have been guilty of many outrages near the boundary and have made raids on American soil, intending, it is said, to force intervention. In the Senate at Washington, on the 19th, Mr. Fall, of New Mexico, said that conditions on the border were intolerable. Madero could not protect American property. Americans living near the boundary were angry, had bought arms and might even invade Mexico. Our Government, he added, ought to recognize the belligerency of the Orozco revolutionists. It is asserted in a Mexican newspaper that Mr. Fall is interested in a large tract of land in Chihuahua. Three days later, Senator Bacon, while opposing the landing of marines in Nicaragua, said that similar action in Mexico would cause war with that country. Such a war, he

added, might help Mr. Taft's campaign by diverting attention from domestic issues.——The Zapatists are active in the South, where towns were sacked by them last week.

The Franco-Russian Treaty and the Dardanelles

The visit of M. Poincaré, the French Prime Minister, to St. Petersburg and Peterhof, is made in a year which recalls historic memories. It is just a century since another Frenchman —if a military commander born in Corsica may be called French—visited Moscow. The St. Petersburg *Vetcherny Vremia* publishes this program of the celebration of the centenary of 1812:

August 25: Evening service and solemn *Requiem* in all the Churches.

August 26: *Te Deum* and prayers to be said in the open air. Popular lectures. Stage performances wherever the local resources permit.

Inasmuch as August is a harvest month, and as it is also true that Napoleon's retreat from Moscow was begun on October 11, it has been requested by the governors of certain provinces that the celebration be postponed, but the central government has denied these requests. Meanwhile the Russian press congratulates the allied nation that their treaty now extends to their navies as well as to their armies. German newspapers reflect a peevish state of public opinion. Interesting in that connection is the comment of the Italian press, which may be represented by the *Popolo romano:*

"The Franco-Russian alliance, like the Triple Alliance [Germany, Austria, Italy], represents a guarantee of European peace. Italy, firmly attached to the Triple Alliance, finds herself in cordial relations with France and Russia, and sees in the demonstrations which have greeted M. Poincaré an indication of the continuity of the European *status quo*, constituting a solid basis for peace."

In spite of the consolidation of the Franco-Russian treaty, which it qualifies as "a useful thing," the *Giornale d'Italia* is convinced that Russia will continue in accord with Italy in Balkan matters, while "France, as a Mediterranean Power, will maintain its friendly relations." It is taken for granted that Russia aims at the opening of the Straits and development as a Mediterranean Power, when her navy has been reconstituted.

The Turks and the Balkans

Thirty Albanian insurgents were killed and twenty wounded in an attack on the Turkish seaport of Durazzo, on the Adriatic, August 22. There were six casualties on the Turkish side.——A mass meeting held at Cettinje, the capital of Montenegro, on August 20, protested against Turkish atrocities in the Berana district of Albania on the Montenegrin frontier. A resolution was voted calling upon the Government to declare war against Turkey. The war spirit is growing thruout the country. Tho it is said that the Albanian insurgents who were marching on Salonika have agreed to disperse and return to their homes, fighting has occurred on the Montenegrin frontier much as if war had been formally declared. The Porte has requested Montenegro to discontinue her military preparations, and has received assurances that no Montenegrins will in future cross the frontier.——Turks attacked the town of Sienitza, in European Turkey, on the southern frontier of Servia, on August 24. (This town is only thirty miles north of Berana, which was recently attacked by Montenegrins.) The Turks are said to have massacred many of the inhabitants. These reports occasioned great excitement at Belgrade, where the press and mass meetings have called upon the Government for vigorous protest, if not war. In Bulgaria, also, public meetings reflect the war spirit of the population. The Ottoman Government has received the preliminary report of the commission which investigated the massacre of more than 140 Bulgarians on August 2 at Kotschana, near Uskup, showing that the civil and military authorities failed to do their duty, and that Turkish troops took part in the attacks on the Bulgarians. The Turkish Government has ordered that a state of siege be declared at Kotschana, and that the guilty persons be court martialed without distinction; and sends $5,000 to the town to be distributed among the sufferers.——Turkish women are selling flowers on the streets of Constantinople to obtain funds for the relief of the sufferers from the recent earthquake along the sea of Marmora.——From Paris it is reported that France accepts in principle the project of Count Leopold von Berchtold, the

Foreign Minister of Austria-Hungary, to obtain gradual autonomy for all the European states of Turkey. It is reported that Austria has occupied Novibazar, capital of the district of that name, in European Turkey, and only about thirty miles east of Sienitza, where the massacre of Serbs is said to have occurred very recently. The Turks are reported to be rapidly mobilizing their forces, fearing a further annexation by Austria, and perhaps a general partition. The Government, which is made up of leaders of the military party, is said to have received assurances of support in this crisis by the Young Turks, whose ministry it replaces.——The Arab chiefs of Tripoli refuse to countenance peace talk.

The Moorish Sultans

Mulai Hafid, who has abdicated the Moorish throne, was proclaimed Sultan at Fez, January 4, 1908. His accession occurred toward the close of a turbulent period, Morocco being torn by strife partly growing out of the Franco-Prussian dispute over territorial rights. In 1907 Mulai Hafid drove his brother, Abd-el-Aziz, from the throne and forced him to take refuge within the French lines. Abd-el-Aziz was regarded as friendly to the French course; Mulai Hafid, on the other hand, posed as an anti-European, tho he was suspected of German sympathies. After Hafid had given certain guarantees he was, however, recognized by France as well as by Germany. But Mulai Hafid has been discredited with his own people almost from the start, in part because of barbarities and extortion, and he has been without any power except in so far as France has lent him force and protection. Indeed, he was only lately besieged in his own capital by his own people—and saved only by the French. He has explained the motive of his abdication on different grounds. To a French journalist he said that it was a case of bad health, requiring change and rest. To the London *Times* correspondent he told a tale of the new regime requiring new men, his one desire and prayer being that his country may enjoy peace and prosperity. Some time ago the ex-Sultan exprest a desire to abdicate *after having made the pilgrimage to Mecca.* Not in Morocco alone, but also in Algeria and Tunis, the abdication would have taken on, in these circumstances, the dignity of a religious protest. But the French were too wily to let him carry out this program. They even insisted that he himself nominate his successor. On August 14, therefore, a letter written by Mulai Hafid was read in the mosque at Rabat, naming, not one of his infant sons, but his brother, Mulai Yusef, until recently Caliph of Fez. In this capacity Yusef gave evidences of loyalty and good will toward the French, and he is said to be a man of moderation and piety, altho some of the French journalists represent him as unintelligent. But if he is less brilliant than Abd-el-Aziz and Mulai Hafid, he has the advantage of not having their past. And the new regime will perhaps make a better start with a newcomer as figurehead. The French Resident-General, General Lyautey, is said to esteem Yusef, and he has communicated to M. Poincaré, Prime Minister, a telegram addressed by the new Sultan to President Fallières. This states that the Sultan will complete the entente with France and wishes to work with that country to give Morocco a regime of peace and progress. M. Poincaré has replied in the name of the President of the Republic that he is much pleased and that the French Government will lend Mulai Yusef its best offices, while respecting Moslem beliefs and traditions. On the elevation of Abd-el-Aziz and Mulai Hafid to the Moorish throne the French Government honored them with decorations. This offended public opinion in Morocco, and it is said that the error will not be repeated in the case of their successor.——The ex-Sultan will receive an annual pension of $75,000 and has been awarded a lump sum of $80,000. These amounts are large—and it is said, too, that he has bank accounts in France which represent his savings as Sultan—but perhaps the French Government takes into account the size of Mulai Hafid's family. (He is said to have 125 wives.) Since reaching France the ex-Sultan has been lionized by the public, and the press is full of his sayings. El Hiba, southern pretender to the Moorish throne, is the son of Mad-el-Ainin, who formerly gave the French much trouble. El Hiba entered Marakesh, one of the

three capitals, on August 18, and was proclaimed Sultan. His followers—a warlike, well armed and aggressive body of men, said to number 50,000—sacked and burned the houses of Europeans and the consulates. The city had been evacuated by the French only a few days before. The Kaïd El Glaoui, who is loyal to France, and the French consul to Marakesh, M. Jacques Maigret, remained, with three French army officers, in the house of the Kaïd. The relief expedition of Colonel Mangin has received orders to hasten its march. General Moinier, who is in France on sick leave after four years' almost continuous service in Morocco, calls the southern country round Marakesh *le gros point noir* of Morocco. General Moinier does not expect to return to the protectorate. He is succeeded by General Franchet d'Esperey, a veteran of thirteen campaigns. General Moinier is optimistic as to the outlook—once General Lyautey's reinforcements have arrived and El Hiba can be crushed. But this will be a long story at best.——General Moinier, at Marseilles, said to a reporter that the abdication of Mulai Hafid was a foregone conclusion—

"and we ought to consider it a happy event. He is not a friend of France. He is not a Sultan with whom one could hope to collaborate. He is a blunderer who was always promising and never stuck to his word. He did not consider the protectorate as an unjust regime, but rather as a system contrary to his interests. It is for that reason that he has slyly combated it. He was, besides, surrounded by religious chiefs who excited, provoked and urged him against us."

Chinese Affairs

The National Assembly considered, on August 20, the Government's explanation of the summary execution of Generals Chang Chen-wu and Feng-wei, members of Dr. Sun Yat-sen's party. The explanation was found unsatisfactory, and the Assembly demanded that the Premier and War Minister attend the session of the 21st to give further information. On that day President Yuan sent a dispatch declining to permit this and suggesting that the Hu-Peh members of the Assembly visit him. The minority thereupon violently denounced Yuan, and threatened impeachment, but ended by backing down and calling upon the President, who explained the Government's attitude so effectively that they left his presence apparently won over to his side. The Government is thought to possess proofs of the guilt of the executed generals and of the complicity of several high officials in the Government service in a secret society for the overthrow of the Government. The plans of this society are regarded as a continuation of a plot recently unearthed at Hankow to revolt against the present Government. Altho many dread Yuan's influence, he is regarded as the only possible chief at state at present. On August 23 Dr. G. E. Morrison, the correspondent of the London *Times*, lately appointed special adviser to the Chinese President, wrote a letter to the British press protesting against the sensationalism of news reports and comment on Chinese affairs. He repudiates the suggestion that Yuan aims at a dictatorship, and says that there is indisputable evidence that the two arch conspirators, Generals Chang and Feng, who were executed at Peking, were plotting against the Government and trying to sow dissension in the army. They already had secured many followers at Wuchang. Dr. Morrison denies that the rivalry between the three factions in he Assembly threatens the existence of the republic. All three are equally republican, and the rivalry is one of programs such as obtains in all political parties.——A desperate attack on the island of Cheung Chow, a part of the British colony at Hong-kong, and used chiefly as a missionary sanitarium, was made by 100 pirates on the night of August 19. After landing from their junk, which was towed by a launch, the pirates overpowered the police and looted the houses of the inhabitants, who number about 2,700. A heavy rain prevented the pirates from carrying out their threat of burning the town.——On August 25 rioting at Tung-chow was reported from Peking. The disorder was attributed to an edict commanding the troops to cut off their queues. Part of the city has been burned and looted, and troops have set out thither from Peking.——Dr. Sun Yat-sen received a great welcome on his recent arrival at the capital, where he had consulted with President Yuan.

Fishing for Pumpkin Seeds

BY O. WARREN SMITH

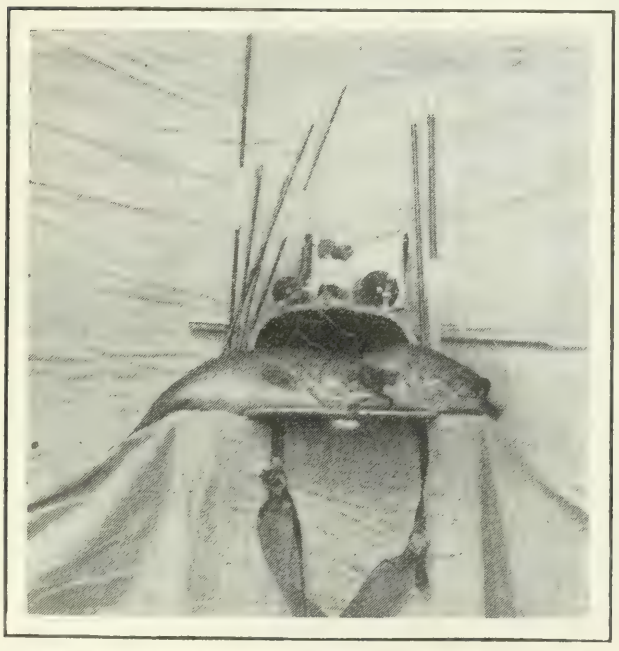
WHEN I was a boy I used to play at being a man; now that I have grown to man's estate I play at being a boy. When a boy I fished for "sunnies," because my wise mother would not allow me to visit the large river where the men caught real fish. Now that I may visit the large stream whenever I please, I from choice wend my way to the little creek from which only pumpkin seeds and chubs may be taken. I wonder why it is that the thing we can't have we desire, while the thing we have we do not value. I sometimes think that, had that particular tree in the Garden of Eden been without a no trespass sign, our first parents would not have sampled its fruit. I know that were it possible to prohibit men from angling for pumpkin seeds, we would see them crawling under fences and sneaking by guards even as they do on certain posted trout waters; but because they can angle for the humble fish of boyhood days whenever and wherever they please, most of them never think of doing so at all. Another reason sunnies are not angled for is because few grown-ups dare brave the smiles of their acquaintances. "Pumpkin seeds, forsooth—a boy's fish!" It is not conscience that makes cowards of us all, but other people's opinions.

There is a peculiar attractiveness about angling for an unimportant fish; you do not much care whether you catch them or not, therefore you have more time to think of tackle and the proper method of handling the same, as well as being open-eyed and open-eared toward nature. Bless you, I have fished for trout and bass with fellows so eager to take fish that they never had any time for nature, and as for tackle, that which would take the most fish in the shortest possible time was the best. The only reason those men do not use dynamite is because it is against the law. As an editor of an angling department in a magazine devoted to sport, I get letters and pictures from all over the United States, and I am constantly surprised to discover that most men think that if they can catch fifty trout or bass in a day, then stand up before a camera and have their pictures taken, they have had the best time ever. Now, I do not like to publish such letters and pictures, because the latter appear to me unartistic and the former unsportsmanlike. What is there attractive about a picture of a string of fifty or more bass? I can do more with two goodly fish, a rod and creel, and when my pictures are printed I have something worth while, something that suggests the attractiveness of fishing. Slaughter-house pictures should be taboo.

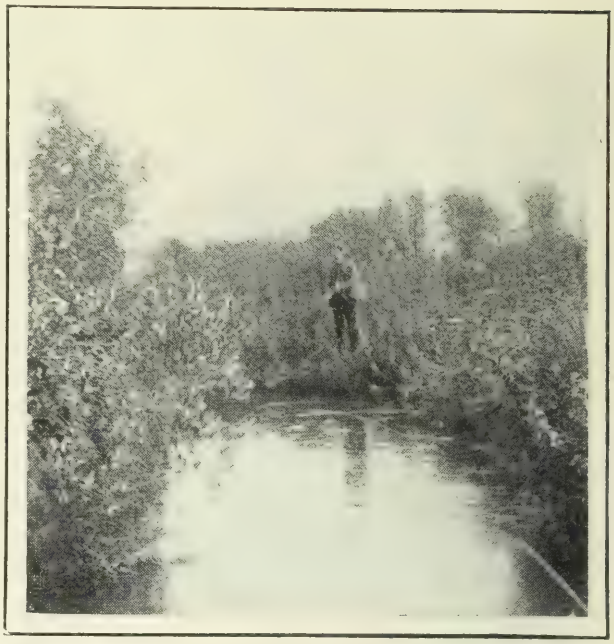
You see how far I have wandered from my subject, but that is the attractiveness of pumpkin seed fishing—you can drop it at any time. Most of us think of sunfish as lake dwellers, and they are, but they are also found in the creeks emptying into lakes, that is, if the creeks possess holes three or four feet deep; and it is there one may enjoy the true poetry of sunfishing. Of course, one may use bait, either worms or grasshoppers, and catch hundreds of the beautiful little creatures, but there would not be much sport in that; they are so voracious that they will swallow a small hook before you can say "Jack Robinson." (I don't know why "Jack Robinson" and not "John Smith," but one must humbly

bow to precedent.) But I would not use worms, no, not unless I was in dire need of food. You see, I have discovered that the delicate little sunny will rise to artificial flies as freely as do the more aristocratic, but, ounce for ounce, not more gamy trout. Oh, laugh if you want to; I know what I am talking about. The discriminating angler, properly accoutered, will enjoy fly casting for sunfish for what they are as well as for what they would be were they larger. I know of no fish that will stir one's imagination as will the sunfish when they dash away thru the water, utilizing every ounce of their puny strength.

The proper rod for sunfishing is the lightest and most delicate cementing of six strips of split bamboo that it is possible for a skilled workman to produce. A two and a half ounce eight foot rod would be ideal, but few of us can afford to commission a builder to make us such a fairy wand, so we perforce must content ourselves with a cheaper tool. Fortunately we who belong to that great class which Abraham Lincoln said God loved need not get along without a light rod for our play fishing, for a certain dealer in New York City gets out an eight-foot rod called the "Tuscarora" which weighs only a fraction over four ounces. A rod perfect enough to satisfy the most fastidious tackle crank, a rod that suggests the bending reeds which environ a marshland lake, yet withal is a dependable tool. Understand me, the rod is in nowise a toy, but a veritable fish-pole, one that you will use with joy when angling for trout in Meadow Brook. Best of all, this paragon among light rods retails for $5. I may not here tell the dealer's name, but I will gladly supply the interested with his address. The reel for such a rod and for sunfishing should be the lightest single click obtainable, preferably of hard rubber, tho aluminum will do. Do not be alarmed, such a reel can be secured for a dollar or less and will be natty enough to grace a lady's boudoir. In order to preserve the unities one should purchase seventy-five feet of enameled silk line of small caliber, say size H, preferably of mist color. A three-foot leader also, as delicate as a child's dream. Such an outfit as I have been describing, rod, reel and line, will weight the back-breaking amount of eight and a fourth ounces. Reflect upon that, you wielders of cumbersome salt water tackle. Verily it is not all of fishing to fish.



Thus far I have said nothing of the flies adapted to this sport—yes, sport, I



"JUST AS THE SUN SINKS BEHIND THE WESTERN HILLS"

say it boldly, even blatantly. I have found that the smaller the fly the more successful, so now I use those little midges so small that one almost needs a hand lens to see them at all. The particular pattern is not so much a matter of importance providing red be the predominating color. The Ibis, of course, is good, as are also Jenny Lind, Parmachenee Bell, Montreal and flies of that ilk. One fly on the leader is enough, so if you have a penchant for the dry fly you may indulge your fancy. This fish of the bent pin age is a surface feeder, and the way he dashes at the hook indicates that the black bass is related to him, not he to the black bass; I verily believe that the whole sunfish family sat at the feet —or rather fins, shall I say—of the pumpkin seed and took lessons concerning how to bite and how to fight. As the sunfish is a surface feeder in the matter of flies at least, the successful angler will comport himself accordingly, casting as carefully as he would were he angling for brook trout. Seldom will it be needful to allow the fly to sink beneath the surface, as is the case with the little fellow's overgrown relative, the black bass. Care, circumspection and delicacy are all that one needs to become a successful pumpkin seed fisher, that is, if he be properly appreciative, otherwise he will find nothing for him in such sport.

Yet fishing for this living gold is the

"I CAN DO MORE WITH TWO GOODLY FISH, A ROD AND CREEL . . ."

"EVERYWHERE BLACK-EYED SUSANS LEAN OUT OVER THE WATER"

stuff that dreams are made of." Come with me and I believe that you will acknowledge the truthfulness of the statement. Just as the sun sinks behind the western hills, painting the heaped-up midsummer thunder-heads with a riot of color unbelievably magnificent, we slip into the pasture thru which the little creek wanders on its way to the lake. Time was when the little creek was a trout stream, but those days are long since passed; now it is visited only by boys and boyish men. Everywhere golden rod and black-eyed susans lean out over the limpid water, by which sign we know that Jack Frost will soon come down out of the northland, that autumn is drawing near. Yonder sumac blazes red against the eastern sky, while in that bit of marshland several cardinal flowers lift their flaming heads above the grass. Red and gold in the sky, gold and red upon the earth; yes, by those signs we know summer is on the wane. Did you hear that? No? Well, it was the song of the indigo bunting, the bird that sings when others think of the southland. Somehow we seem to fit into the general scheme of things; Nature has accepted us and our outfits, almost as tho we were boys once again, with bent pinhooks and willow wands.

Yon pool looks like a good place to me, and I am going to essay a cast. There is no hurry, for I have all the time there is, so before I cast I pause, once again to

drink in the solemn, heartening beauty of the scene. There is a hush, a religious atmosphere like unto that of Old World cathedrals. I am conscious of a spiritual presence seldom met in man-made churches. I remove my hat; to keep it on would be sacrilege. Suddenly there is a little commotion on the surface of the pool, a concentric circle of ripples racing shoreward. Instantly my fly seeks the water in the exact center of the disturbance, and almost before it touches the surface an inquisitive sunny snaps at it. The action of the wrist, automatic thru years of practice, sets the hook, and the miniature battle is on. Away dashes the little fellow, bravely ripping the gossamer thread thru the water, the lithe rod bending to the strain. It is a splendid fight. Everything in this world is measured by comparison, but at last the strain of the little rod conquers and sunny lies upon the bank defeated. Gaze upon him. Is there a more beautiful fish in fresh water than this Joseph dressed in his coat of many colors, with a waistcoat of burnished gold? Note that splash of brilliant scarlet upon the opercular flap, as tho Nature used up all of her left-over colors when she decorated the sunfish; true it is that no other sunfish, not even the lordly black bass, can boast of a marking so distinctive. I tell you, were sunfish as rare as goldfish we would have the beautiful creatures cruelly shut up in a glass aquarium adding color to the house plants in the bay window. There may be some excuse for imprisoning a bird that sings, but what can we say of shutting up a fish in less than a gallon of water?

I wander from little pool to pool, now and then taking a fish, until as night shuts in I find myself with nine of the little fellows reposing amid the green grass and cardinal flowers upon the bottom of my creel. With night come the night hawks, booming and richochetting thru the air, uncanny actions and uncanny sounds; no wonder the Indians used to believe them the spirits of disembodied shad. So I steal thru the night to the road, and follow the highway back to town.

"What did I do with the fish?" Your question is superfluous. Sunnies *are* small, but when rolled in cracker crumbs and fried crisp and brown in sweet butter they form a dish that well might tempt an appetite more capricious than that of a fisherman. So here is to the sunfish, the fish of boyhood, and here is to all those men who have retained enough of the boy-spirit to enjoy play even when gray hairs have come.

DURAND, WIS.

Birth-Night

BY VIRGINIA WOODWARD CLOUD

THEN man arose in His image,
And molded shape from a clod,
And he strove, but knew not his striving
Was unto eternal God;
He wrought with fierce endeavor
To answer the cry of the soul
And built him fiery altars
But knew not God was his goal.

He fashioned his raiment of beauty
And reared him temples above
Like to the arc immortal,—
But knew not God was love;—
Idols he made, and slew them,
And dyed him in battle and blood,
And paid as dole his immortal soul,—
Yet knew not God was good.

Then, from the places of chaos,
Where all vain strivings are,
From travail whose fruit is darkness,
He followed the light of a star,
From princes and powers that failed him,
From the deserts his feet had trod,
Back to the way of a mother and Child,—
And it was eternal God.

BALTIMORE, MD.

Our Presidential Electors

BY JAMES SCHOULER

[Few persons can speak with more authority upon the electoral college which has become such an important question in the present campaign than Dr. Schouler, the author of a "History of the United States (1783-1899)" in six volumes; lives of Jefferson and Hamilton, "Eighty Years of Union," "Ideals of the Republic," and numerous other historical and legal works.—EDITOR.]

IT is well known by this time to students of American history and politics that the original intent of our Federal Constitution concerning the election of a President and Vice-President has become quite subverted in practice in the course of more than a century's experience. Instead of the electoral college—or, rather, a group of separate State colleges—composed of local citizens of celebrity who assemble to choose by themselves, in their respective States, who shall rule in the Union for the next four years, electors meet now merely to cast a proxy ballot and register formally the preference of the State voters at large, as declared at the polls in November. The people decide which list of electors pledged to a party candidate shall prevail. Nominally State electors, popularly chosen, elect the President and Vice-President of the United States by ballot; but actually at this day, the people choose, and electors in the college merely represent them. But the supreme candidates, in any case, must have a clear majority of the electoral ballots in the whole Union; otherwise the choice, under constitutional conditions, vests in Congress.

Thus does the irresistible will of the people now work out results thru the cumbrous methods of an instrument of government conservatively meant in the text. If we consult the authentic testimony, still preserved, of that famous Philadelphia convention which in 1787 framed a Constitution for the Union in secret sessions and submitted its completed scheme to the several States for adoption, we shall find that this creative body of delegates, while scouting, on the one hand, the idea of committing the momentous choice of a Chief Executive for the whole Union to the common voters, dreaded, on the other, a free initial selection by Congress, whether thru House alone, or Senate alone, or by both branches combined. Hence, after much debate and at a late stage of the session, was adopted the device of a Presidential election by special electors, whose separate State colleges should ballot apart on the same day for two persons, of whom one, at least, should not be an inhabitant of the same State with themselves. Their respective elections were to be signed, certified and sent sealed to the seat of government; whereupon the certificates were all to be opened solemnly and the votes counted in presence of the two houses, and the result ascertained and declared.

This intermedium of an electoral college was already a feature of Maryland's Constitution and had been employed in Europe. Its theory was that of vesting an important choice in an independent body of distinguished men, placed high above all political turmoil. No complacency could have been greater than that with which our fathers of 1787 accepted this happy solution of a troublesome problem. It is certain that this feature of our original Constitution attracted but little notice in the various State conventions which adopted that instrument, and that it called out no decided opposition from any quarter. Hamilton, who had favored such a plan in Philadelphia, wrote in the *Federalist:* "The mode of appointment of the chief magistrate of the United States is almost the only part of the system, of any consequence, which has escaped without severe censure, or which has received the slightest mark of approbation from its opponents."*

Times and conditions have greatly changed, however, since the electoral method was first applied, when our peerless Washington was the unanimous choice for President during the two terms that he consented to serve. And two political forces of the future seem to have been left quite out of calculation by those who framed an instrument so profoundly wise in many respects: (1)

**Federalist,* No. 68.

the prompt dissemination broadcast of political news relating to the whole Union, by means of an enterprising press, aided greatly by such later and unforeseen inventions as steam locomotion and the telegraph; (2) the organization of political parties on a national scale, so as to present national party candidates.

In fact, the latter oversight led to mischief as soon as Washington ceased to be a candidate for re-election. Our Constitution, as originally framed and adopted, required the State electors to ballot for two persons simply; and eventually the candidate proving to have the highest number of votes, if a majority, would become President, and he who stood next, Vice-President. Hence in 1796 the electoral colleges made John Adams, the candidate of the Federalist party, President, while his opponent, Jefferson, who led the Republicans, became Vice-President. Worse national mischief and almost disaster followed in 1800; for while Adams and Pinckney headed one ticket for the two offices, the other named Jefferson and Burr; and, tho the latter ticket prevailed in the colleges, the electoral votes for its two party candidates were, naturally enough, found equal. This threw the final selection into the House of Representatives at Washington in early 1801, and members of that body, hostile in sympathy, intrigued to reverse the order intended by the people, so as to place Burr in the President's chair, while remitting Jefferson to the second place. These efforts failed; but Jefferson was not elected until after a deadlock in the House, which lasted several days, thirty-five ballots having been cast without a choice. Meantime our whole country was alarmed; for, had the House failed to elect a President before the 4th of March, it was doubtful, as the Constitution then read, whether there would have been a legitimate President of the United States at all.

Article XII of Amendments to the Constitution (proposed by Congress in 1803 and adopted by the requisite number of States before the next Presidential election in 1804) corrected such defects, and, in connection with the remaining clauses of the original text, supplied the election scheme still in force. Candidates for President and Vice-President are now to be named and voted for separately; in case of any failure to receive an electoral majority, the choice of President devolves upon the House and that of Vice-President upon the Senate; while anarchy from an omission of the House to choose a President in due season is guarded against.

My present purpose is not to enter upon the contingent choice by Congress, but simply to consider some points prominent at the present stage of this year's Presidential campaign, in connection with our electoral colleges. And here we should convince ourselves, first of all, that the Constitution allows the utmost latitude of discretion to each State, acting thru its own Legislature, in the selection of its own Presidential electors. Each State is to choose (or, as the text of our Constitution reads, "appoint") electors in such manner as the Legislature thereof may direct; the number of such electors being equal to the whole number of Senators and Representatives to which the State may be entitled in the Congress; no Senator or Representative, or person holding an office of trust or profit under the United States being eligible as an elector. Thus, disinterestedness in his political relation with the Federal Government is made a prerequisite from the individual; while the total electoral vote of a State bears a fair proportion to the aggregate population of the whole Union and its own essential strength in Congress.

Plainly, it is not imperative, under our Constitution, that the choice of a State's electors shall rest with the voters of the State by their popular expression at the polls. What we are wont to call, at this day, "the people's choice," in a quadrennial November, effects nothing more than a choice of the requisite number of State electors, who themselves are to meet later in the State on a uniform day for the whole Union and cast the really decisive and legitimate ballots which shall elect a President and Vice-President. And tho our several State colleges have always met on a uniform day to give their ballots (the Constitution so ordering), the day on which State electors are chosen at the polls was never uniform for the whole Union until made so by an act of Congress, following the close and exciting

national election of 1844. States, that autumn, had taken the popular choice of electors on days much differing, so that in consequence the voters of Massachusetts, a State sturdily Whig in politics, gave at the polls their loyal support to "Harry Clay" a week after New York's popular vote had made it certain that Polk had defeated him.

More than this, no State is bound constitutionally, in a national sense, to allow its people to vote even for State electors. That is for its own Legislature to determine, subject to a possible mandate of the State Constitution. In our earlier annals there were instances where leaders of some sharply contending party would gain control of the Legislature at an opportune time and get that Legislature, under an appropriate enactment, to make its own arbitrary choice of partisan electors, forestalling all popular expression in the State of a direct character. In aristocratic South Carolina, down to the date of secession and the Civil War, plantation owners ruled the Legislature and the Legislature on each occasion chose all Presidential electors; the electoral vote of the State being actually flung away, in 1832 and again in 1836, upon candidates who had no standing elsewhere in the Union. So, too, as the Supreme Court of the United States not long ago conceded, in the case of Michigan, a legislature may, at its discretion, require all the State electors, except the two at large, to be chosen in Representative districts instead of by general vote and so obtain an electoral college of divided politics.

Even tho a State should cast no electoral vote at all there may result an electoral choice of President and Vice-President, provided candidates receive, as the Constitution expresses it, "a majority of the whole number of electors appointed." It was thus that Abraham Lincoln was re-elected President in 1864, with Andrew Johnson for Vice-President, while eight Southern States in armed insurrection cast no votes at all. And so, too, at Grant's first election in 1868, when three of those same Southern States, not yet reconstructed, were excluded from the ballot. Individual vacancies in electoral colleges have sometimes occurred from one cause or another, such as death or disability, thereby reducing the totals for Presidential candidates; but they seem not to have happened since 1832, and this, I apprehend, may be largely due to preventive legislation in various States. So far as the Union and its Constitution is concerned an electoral ballot not cast at all is lost in the final count; but any State may guard its full number of votes by making provision for filling vacancies in its own college.

We are next to observe that, in any case where the count of totals by Congress shows that no candidate for President has received a majority of the whole number of electors appointed, the House, voting by States, shall choose by ballot from the three highest candidates; the Senate performing a similar duty as to Vice-Presidential candidates. And so it happened in 1825, when parties were extinct and the succession to Monroe had brought out four rival candidates for the Presidency, none of whom received an electoral majority. Three of these went before the House for its selection, while Clay, the fourth, had influence enough in that body to determine its decision. Such a condition of things tempts men strongly to make secret and sinister bargains; and our Federal Constitution would better conform to present sentiment in the nation, were the plurality choice of electors and the people allowed by amendment to be decisive once and for all. Andrew Jackson had the plurality in the contest of 1824 over electors; and tho John Quincy Adams, chosen above him by the House in 1825, was the better qualified for President as traditions went in those days, this affront to the people rankled deeply until, in 1828, Jackson was borne to the polls again with an overwhelming triumph. At this day the plurality idea dominates in most State elections, so that in each Presidential November we see usually a college of State electors chosen by a plurality vote of the people. And yet, whenever a third candidate runs, as in the present campaign, who seems strong enough to capture the electoral vote of a single State, there is great danger that the people's preference will be overborne by the eventual balloting of our House of Representatives at Washington—and that, too, a House about to expire and perhaps already discredited at the November polls.

Furthermore, it should be borne in mind that, whatever may prove the balloting of a State electoral college, the final count, with its total computation, belongs to Congress, whose official announcement of results gives sanction and authority to the new incumbents of supreme executive station. That lesson was sufficiently impressed in the fierce electoral struggle of 1876-77, when Tilden and Hayes, national Democrats and national Republicans, contested for the prize of the Presidency. State electors may plan and plot to override the wishes of State constituents as exprest at the ballot box in November; but if their success in doing so would change national results Congress and the final electoral count must be reckoned with.

The question is asked, at this time, has a State elector the right to cast his ballot in the college as he chooses, regardless of the wishes of those party voters he represents? Doubtless he had, under the original theory of our Constitution, for then he was considered no party representative at all. But the cardinal American idea, in our present age, is that the people rule and elect rulers, so that Presidential electors are in effect their chosen agents. No poll in November by the people of a State can now be a fair and honest one, unless each voter may feel assured that the whole list of State electors for whom he casts his ballot stands morally pledged to his own candidates for President and Vice-President. Two illustrations are in point—the only ones I know of which stand for precedents. At Monroe's re-election, in 1820, the whole electoral vote of the country was his by the popular expression; an honor from the nation such as no one else except Washington ever gained before or since. But among New Hampshire's State electors was an eminent citizen of Federal antecedents who resolved that such signal honor should not be bestowed, and accordingly threw away his ballot by a vote for John Quincy Adams. Congress, on the electoral count, respected that ballot as cast; Monroe's re-election was beyond cavil, but he lost the distinction of electoral unanimity which the people of the whole Union, New Hampshire included, had intended for him. But in the Hayes-Tilden election strife matters turned out differently. There were, then, national parties to contend, as there were not in 1820; and while the popular expression in November indicated the national triumph of Tilden and the Democrats, their Republican foes presently laid claim to three Southern States, reconstructed but lately and corruptly governed—South Carolina, Florida and Louisiana. These States, being secured to Hayes by compliant returning boards, would carry the Republican candidate into supreme office by an electoral majority of one. To reverse such a result, corresponding tactics were attempted by Democrats in the Northern State of Oregon. The popular vote in that State had given its three electors to the Republicans; but the Governor was a Democrat, and, considering the immense stake at national issue, all three electors were not steadfast. A single ballot cast by one of them would have assured Tilden of the Presidency, if accepted at Washington upon the electoral count. But it was not so accepted; and, regardless of such treacherous ballot, whatever Oregon's formal certificate might be, the three electoral votes of that State were reckoned for Hayes without discussion. That tremulous conspiracy failed, whoever may have been concerned in it. From this I infer that, under normal State conditions, the undisputed preference shown by the people at the polls in November will guide Congress in an electoral count, even tho the electors chosen should seek with their own ballots to change the final outcome.

At this time and for the approaching Presidential election of November, the country is threatened with a novel complication in a few doubtful States, where some Republican candidates already on the party list for electors proclaim their intention to ballot, if chosen, for Roosevelt instead of Taft, the regular party candidate, who now seeks a re-election to the office he already holds. Such State entanglements are due to the undermining of our old convention system of Presidential nominations by popular primaries on one side and by a disregard of convention conclusions on the other. Our recent blanket or official ballot in States tends to increase the confusion, since a voter may not clearly apprehend just what list of electors is completely pledged to his own Presidential candidate. In

earlier conflicts, when each party printed its own ticket, headed by the chief candidates and some patriotic emblem, one knew that the ticket which he placed in the ballot-box had a loyal list of electors upon it; but now it is otherwise. The party managers are just now seeking a way out of such complications, and it is in the interest of the voters and for the credit of the American name that they find it speedily.

Fortunately, the present entanglement is preliminary and confined to but a few States, upon which the national gaze is already concentered. Each State of the Union acts independently in appointing its Presidential electors; and in such a conflict each State affords its own battle-ground. State voters may differ widely as to who shall rule this Union after the 4th of next March, but upon affording each voter an intelligent and *bona fide* ballot all honest citizens of a State are agreed. If there is time and opportunity a special session of the Legislature may be called, so as to pass an appropriate act in season to correct the local mischief. To some extent the State courts may apply preventive remedies; and already an appeal has been made, in the case of Kansas, to the Supreme Court of the United States. I venture the opinion that our Federal tribunal of last resort will decline to interpose in a matter which the Constitution leaves so clearly to a State's own political discretion; but, at any rate, that litigation should serve to fix the voter's attention strongly upon the threatened evil and lead him to some means of averting it. He will be a hardy elector who, if a Presidential election is thought to turn upon his ballot, will dare face the indignation, not of fellow-citizens of his own State alone but of the whole Union, after casting it contrary to the people's mandate.

Our present electoral scheme for choosing a President and Vice-President is in various respects antiquated and difficult to apply, and it deserves amendment; yet it has its merits, in the localizing of an election nation wide, and in regarding the relative importance of each State. Its machinery has worked smoothly and effectively at all such elections but one, for more than a century. We veteran voters who went thru the storm and stress of the Hayes-Tilden controversy have little fear that a new strain to our popular system of government awaits us in the present contest. Much of this voting entanglement in certain States may be solved before the popular vote is cast in November. The result of that popular vote, the Union thru, will be known, footed up and accepted at large, long before the electoral colleges meet. Of the recognized chief candidates, Taft, Wilson and Roosevelt, one may win an electoral majority too great for falsely disposed electors to overturn; or, on the other hand, none of the three may gain an electoral majority, so that the choice will vest inevitably in the House of Representatives. Finally, and under all circumstances, as we must bear in mind, the official count and announcement of results belongs to Congress, and not to any State.

In 1876-77 Southern States had lately felt the iron heel of military occupation, and in each disputed commonwealth scalawag administrators were ready to defy and overrule the wishes of its intelligent inhabitants; while at the White House the conquering hero of our Civil War ruled already. To many at the North who had borne the toil and sacrifice of sustaining the cause of Union and freedom it seemed like throwing away the fruits of a hardly-won victory to permit the Democrats to come back to national power. But today all is peace. Every State holds its normal relation to the general Government, and the sincere wish of our people is to hold a fair and honest election thruout the entire Union and place the winning candidates in possession. Whatever obstacles may arise, public opinion and the good sense of the people will succeed in peacefully surmounting them. Popular determination arrested a hostile House in 1801 in that miserable intrigue which would have put Burr instead of Jefferson into the Presidential chair. In 1877 popular determination compelled a wrangling Congress to desist from all high-handed purpose and delegate the electoral count to a special tribunal of dignitaries, styled the Electoral Commission. Today public opinion in the whole United States is stronger than ever and the good sense of the people will surely prevail.

INTERVALE, N. H.

A New Electoral System in France

BY J. SALWYN SCHAPIRO

[The recent change in the electoral system of the French republic has a special interest for us now when similar methods to secure proportional representation are being advocated in this country.—EDITOR.]

FRANCE, as usual, has courageously taken the lead in political experiment. On July 10 a bill passed the Chamber of Deputies, by a vote of 339 to 217, which will revolutionize the theory and practice of representative government. This measure, which establishes proportional representation in France, was piloted thru the Chamber with the greatest difficulty by the Poincaré Ministry. The opposition, curiously enough, was led by the Radicals under the leadership of Clemenceau and Combes. It is to the moderate Republicans, Royalists and Socialists that credit must be given for passing this progressive act. The Radicals had won their triumphs under the old system and were fearful that a change would favor the enemies of the present republic, of which they are the jealous guardians. It is the old story of the progressive turning conservative when his work is accomplished. The bill is now in the Senate, where, in all probability, it will pass substantially in its present form.

The French electoral system, which the new bill aims to abolish, is known as the *scrutin d'arrondissement*. Candidates are nominated in every *arrondissement*, which corresponds to our Congressional district, and to be declared elected the nominee must receive a *majority* of all the votes cast. As there are many parties in France, it often happens that the highest vote given to any one candidate is only a *plurality*. In such a case there is a second ballot, generally between the two candidates who came out highest in the first ballot. The defects of district representation, so glaring everywhere, are intensified in a highly centralized government like that of France, where the local politician has the vast influence and patronage of the national administration behind him. Petty considerations, coercion and favoritism are often decisive factors in behalf of the candidate of the party in power at Paris. The "peanut" politician is a common variety in France, and a power to be reckoned with in the make-up of ministries. The prevalent dissatisfaction with Parliamentary government in France is in part due to the system which has introduced so many small men in the public life of the Third Republic. The willingness to sacrifice national for local interests, so common everywhere and particularly in our own country—witness the disgraceful history of American tariff legislation—is the natural outcome of a system which fills a legislature, nationally organized, with representatives who are locally minded.

For the last ten years a great agitation has been in progress in France to abolish the *scrutin d'arrondissement* and establish in its place proportional representation and the general ticket system. Most of the members of the present Chamber of Deputies were elected pledged to these reforms, hence the present measure has the support of the French electorate. The main features of the bill are: The *scrutin d'arondissement*, or district system, gives way to the *scrutin de liste* or general ticket. The "department," which corresponds to the American State, is made the unit of representation, and one deputy is to be allotted for every 70,000 of its inhabitants. If the remainder is over 20,000 the department is entitled to an extra deputy. The various parties will present lists of candidates, arranged in the order of choice, as determined upon by the party organizations. Each citizen is entitled to as many votes as the number of deputies allotted to his department. He may give all his votes to one party, or he may distribute them, as he sees fit. The total vote is then divided by the number of seats in the department, and the result is known as the "electoral quotient." Each party will be entitled to as many

seats as the "electoral quotient" is contained in the number of votes it received in the election. So far, everything is simple. The difficulty arises, however, in solving the problem of assigning the remainder seats to correspond with the remainder votes of each party. In this matter the bill is necessarily complex. One remainder seat is given as a bonus to the leading party, if it happens to receive a majority of all the votes cast in the department, unless it has already won a majority of the seats there. Another remainder seat is assigned to the party that receives the highest average vote for its candidates. An illustration will perhaps make this more clear. Supposing in the department X ten candidates are to be elected and 100,000 votes are cast. The "electoral quotient" is then 10,000. Of the total vote, let us say, the Radicals received 44,000, the Conservatives 37,000 and the Socialists 19,000. Dividing the "electoral quotient" 10,000 into the vote of each party we get, viz.:

Radicals	4	seats and	4,000	votes	over
Conservatives	3	" "	7,000	"	"
Socialists	1	" "	9,000	"	"

Eight seats are thus disposed of, but there still remain two to fill. If the Radicals had received a majority of the 100,000 votes cast, they would be given one remainder seat as a bonus. But, as they didn't, it will have to be assigned in a different way. Suppose we give to each party one additional seat. The Radicals will then have 5, which will give them an average of 8,800; the Conservatives 4, an average of 9,250, and the Socialists 2, an average of 9,500. As the Socialists have the highest average, they are entitled to one remainder seat; the Conservatives, having the next highest average, get the other remainder seat. The assignments are now complete. Of the ten deputies to be chosen in the department X, the first 4 on the Radical list, the first 4 on the Conservative, and the first 2 on the Socialist are declared elected. If, before the election, several parties had given official notice that they wished to pool their interests for the remainder seats, a different assignment would then have to be made. The remainder vote of the parties entering such a combination, which is knowna s an *apparentées*, are then added and treated as a whole. Suppose the Radicals and Socialists, in the example given above, had entered into such an arrangement. In the first place, the combination would be entitled to one remainder seat because their joint total vote, 63,000, is a majority of all the votes cast. It would also be entitled to the other remainder seat, because the "electoral quotient," 10,000, is contained into their joint remainder vote, 13,000, at least once. The Radicals and Socialists would each get one seat more. So in case of an *apparentées,* the result would be, viz.:

Radicals	5 seats
Conservatives	3 "
Socialists	2 "

Undoubtedly this system is complicated, but it has the merit of being scientific and fair. It solves the problem of making audible the minority of voters in any election. According to the present system, let the majority party carry an election by ever so few votes, and the minority, no matter how large, immediately relapses into legal impotence. It can make its voice heard only in tumultuous public meetings, and perhaps in riots. The representative system now in vogue is responsible for many serious political abuses by exaggerating the power of the majority of electors. Government by the majority has inevitably led to government for the majority, a very vicious thing indeed. At present well-organized, determined groups, often very small, determine the political complexion of many constituencies, as a shift of a small number of votes may change the result. The party machines know this very well, hence they really do not cater to the wishes of the majority in a district, but to the desires of a small group, which very frequently has special interests to serve.

The rough-and-ready method of counting heads, known as government by the majority, suited the two-party system fairly well, politically wasteful tho it was. The entrance of a third party in the political arena often reduces the majority system to absurdity, as it not unusually leads to an election by a plurality, *i. e.*, government by the minority. Many times has Tammany been put into office by a minority of the voters of New

York City. Prof. John R. Commons in his book, "Proportional Representation," gives many glaring instances of minority rule. The Fifty-first Congress, which enacted the McKinley tariff law, consisted of a Republican majority, which was elected by a minority of the voters of the country. In the Fifty-second Congress of 1890 the Republicans got 42.9 per cent. of the vote and 26.5 per cent. of the seats, whereas the Democrats got 50.6 per cent. of the vote and 71.1 of the seats. The great Republican victory of 1894 was an illusion, for, tho that party elected 68.8 per cent. of the members, it received only 48.4 per cent. of the popular vote, an actual minority. One of the most notorious instances of the injustice of our present system was the election of the Oregon Legislature of 1906. This body consists of 60 members, and the popular vote was about 96,000, of which the Republicans received about 54,000, the Democrats 30,000, the Socialists 7,000, and the Prohibitionists about 5,000. Had there been equitable representation there would have been elected 34 Republicans, 19 Democrats, 4 Socialists, and 3 Prohibitionists. Actually, the Oregon Legislature of that year consisted of 59 Republicans and 1 Democrat. The third party movement has now come to stay, both in England and in America, but it needs machinery that will fairly insure its working. The sentiment behind this significant trend in our politics should not be permitted to dissipate itself into mere negation, that is, by defeating one of the two old parties. To be really effective, the third party must directly gain power for itself, and this can only be accomplished by some system of proportional representation.

The majority system has broken down soonest in Continental Europe, because the two-party system has never taken root there. To insure some sort of fairness the rule is that, if no one candidate receives a majority on the first ballot, there is to be a second ballot between the two leading candidates. This method, too, has been found unsatisfactory, as it has directly encouraged the multiplication of many parties that differ but slightly from one another. A new "party" will enter the field in the hope of having a chance to bargain at the second ballotings. Confusion of issues and principles has been the inevitable outcome. The disgraceful bargainings between the various groups in Germany—*politische Kuh-handel* as it is called—has moved Chancellor von Bethmann-Hollweg to recommend the abolition of second ballotings. Inevitably some system of proportional representation will have to be introduced into Germany, as there is a strong and growing sentiment in its favor all over the Empire.

The plain, simple fact of the matter is that our electoral system, which developed in the early part of the nineteenth century, has broken down when confronted with the social problems of the present day. In the past, the issues were largely political in character. Each of the various parts of the country had a distinct economic life of its own, and it was therefore very natural for the voters to divide according to locality. But the great electoral combats of our day are over social questions, and the division at the polls is largely according to economic groups. Because of the greater economic uniformity of our country, the workingman in Pennsylvania has the same interests at stake as the workingman in Georgia or in Oregon. What is needed, therefore, is an electoral system which will harmonize with our present economic life.

An excellent result of proportional representation is the necessary enlargement of the constituency. If the system were introduced here, the State, instead of the district, would become the unit of Congressional representation. In the first place, this would immediately eliminate gerrymandering of any kind. Secondly, an enlarged constituency always means an enlarged opportunity to nominate better men. Each party, to gain popular support, would put on its list of candidates men who are known all over the State. It is quite probable that those who had distinguished themselves in public life would be chosen as our representatives, instead of the corner-grocery and corner-saloon statesmen whom we have delighted to honor.

CAMBRIDGE, MASS.

The High School and the "Standard"

BY WILLIAM HUGHES MEARNS

MOST principals and teachers agree that the "standard" of the school must never be lowered. Pupils may come and pupils may go, but the "standard" must be kept up forever. And undoubtedly pupils do go. At the end of every term examination thousands of normally healthy youngsters drop out of the high schools like pits from a patent cherry stoner. As a class they look much more useful than cherry pits. Judged by their report cards, one would expect to find them anemic, stupid weaklings; on the contrary, they are frequently a full-blooded lot, athletically built; they are apt to be good dancers, amateur actors, officers of social clubs, alluring and rhythmic cheer leaders, Beau Brummels and Madame Pompadours. Their schoolroom ingenuity, full of life-giving joy for their fellows, is fatal to the teacher with a weak heart. They are clever of speech and remarkably well informed on matters not in the school curriculum—a thoroly likable group that has had a serious falling out with the school "standard."

In a first year high school class I once found these youngsters composing 75 per cent. of an algebra section. Thirty-six out of forty-eight had not come up to the end of the term "standard." "Early in the year," explained the teacher, a man noted for holding a high standard, "I discover the group in the class that can 'get' algebra. It is usually about 25 per cent. To these I give my whole time and let the remainder shift for themselves. I told these fellows—the 75 per cent.—frankly in the beginning of the term that unless they got up steam we'd leave them behind in June. The result shows I was right. Why, there's no use wasting time on that crowd; they couldn't get algebra if they stayed here a hundred years!" I politely agreed with him. Then he went on to tell me how one of his former 25 per cent. boys had just missed senior wrangler in mathematics at Oxford. That school is famous for its mathematic prodigies; but the June reports showed that 51 per cent. of the first year class had failed in algebra.

The "high standard" of a famous Harvard preparatory school is maintained by a similar method. The prospectus announces that in all the years of its existence the school has not had a single failure in the Harvard entrance examination. Any one sent up, they claim, is sure to pass; but care is taken that only those sure to pass are ever sent up. If there is any doubt about the boy, he does not get the chance. The hard-earned reputation of a dividend-paying school is the really important thing.

To save some young man from becoming a Harvard man may, after all, be a worthy act. The matter is more serious, however, when it affects the educational lives of children. Not so long ago, when ceremonious examinations were in vogue for admission to city high schools, the grammar schools that put thru the greatest proportion of successful applicants were given the highest official standing, and the only measure of the success of a grammar school was the percentage of pupils put thru the high school test. Certain schools were soon famous as "100 per cent. schools," those that year by year recommended none but successful candidates.

The high standard of the school was always at stake. Therefore rigid preliminary examinations were held to weed out those who might fail and so injure the record of the school. Many principals declined to consider a boy or girl who could not achieve an average of 80 per cent. in the preliminary test, altho the city minimum was frequently as low as 65 per cent. The reputation of those institutions still lingers today. One of these, whose standard was almost notorious, gave searching written and oral examinations to every child that sought to enter the school at any grade, cleverly excluded the unclever—put them off

on some one else, always with the explanation that "the pupil does not come up to our standard"—and openly advised the older pupils to stay two years in the highest grade in order not to risk a failure in the high school test. There was rejoicing, I fancy, when a weakling dropped out thru over-pressure, or when a slow pupil decided to learn the office-boy business.

As the rivalry among these schools grew more intense, one set of grammar schools held Saturday drill sessions, some began daily at eight o'clock instead of nine, and others declined to teach important examination subjects like arithmetic and grammar until after the four o'clock dismissal. "Homework," aimed to hit possible examination questions, was added to the load. One principal had the requirements of the course of study printed in condensed form for memoriter work, with catechetical question-and-answer guaranteed to beat the most tricky examiner. These were sold to the children and used in the classrooms in lieu of text-books. The public praised the work of such schools, the pupils were proud of the record, until a wise superintendent (I cite the case of one city) abolished the cram-examination. The old method of fact-grinding still continues in some spots, altho recently a district superintendent put the elimination and retardation test on one or two of such schools and showed a frightful dropping out of pupils. In one case two hundred fifth-grade pupils had dwindled to seventeen high school candidates. But each of the seventeen was a winner.

I recall how carefully I watched the five eighth-grade pupils that with others some twenty years ago made up my first experiment in teaching. Solely on their record at the final examination depended the standing of the whole school. I was early imprest with the fact that each of these five young persons carried with him 20 per cent. of possible failure. When the likely-to-fail chap spoke hopefully of going to work, we stood ready to help him search the want advertisements, and provide an irresistible letter of recommendation; when the clever sure-to-pass girl spoke carelessly of leaving school, we set to work upon her like a boss politician upon a wobbly voter. The boy or girl was really not important; the "high standard" of the school was wavering in the balance.

This experience is given at some length because the college entrance requirements have for years forced the same sort of program on the high schools. In some instances a particular college with a monopoly of higher education has turned the adjacent high school into a purely mechanical preparatory-to-college institution. Courses that do not lead to college have had a social taboo put upon them. And to secure good results at the entrance examination, really good students have been permitted to spend seven or eight years in a four-year high school. After finishing course A (four years) the pupil declines graduation, and completes course B (three years). The reputation of such high schools always stood unimpeached because their graduates won a large share of the competitive scholarships. Seven and eight hours a week of college preparatory Latin crowded the more important English; physical training was practically eliminated; and there was no place for domestic science—or indeed any science—or for vocational training, local history or geography, social and economic studies, or any other subject vital to young people, but not included in the college entrance requirements. There were no study periods nor helpful preparation in class for the next day's work; and the home study was a test of endurance. The result was a daily panic and a tremendous rush to the exits.

"'All persons more than a mile high will leave the court-room,' said the King looking severly at Alice, at which there was a tremendous clapping of hands from the audience composed largely of private tutors."

The most ridiculous instance that I know to show the sacrifice of the individual to the high standard of the school is that of a young woman whom we shall call Irene Jackson, recently dismissed from an Eastern high school. She was thirty years of age. She had spent fifteen years of her life in that high school trying to come up to the standard. For seven years she was a freshman, for five years she was a sophomore, for one year a junior—which leads one to suspect there was something wrong with that junior year—for two years a senior. Probably she would have been there yet,

competing with her grandchildren—for Irene never achieved a high school diploma—had not the school commissioners abruptly dismissed all high school students that had failed twice of promotion.

One can understand how Irene might have become thoroly attached to that school and have joined vigorously in the campaign of the alumnæ against any change in the course of study, altho it had permitted her to spend the best of her life at an impossible task. We can fancy her emerging from her fifteen-year trial like the three little maids from school who "all unwary, come from a ladies' seminary, freed from the genius tutelary"; but one could never consistently picture her singing with Yum-Yum, Pitti-Sing and Peep-Boo.

> "Everything is a source of fun,
> Nobody's safe, for we care for none,
> Life is a joke that's just begun!"

For Irene Jackson, life was a joke that was well-nigh over.

The objection brought by the so-called classical high schools against the introduction of manual training is based on a question of school standard.

As a high school principal explained in a recent interview:

> "All the traditions of our school are academic. To offer manual training courses would lessen the time we must give to the book branches if we wish to maintain the high standard of our institution. Courses in commerce and other vocational and trade studies would have the same effect. As we cannot afford to decrease the value of the diploma of the school, therefore, we do not welcome the sort of pupil that would elect such courses."

This exclusiveness recalls how Uncle Remus warned Miss Sally's little boy not to associate with the Faver's children:

> "Dem Faver's chillum wa'n't no 'count fo' de war, en dey wa'n't no 'count endurin' er de war, en dey wa'n't no 'count atterwards; en wiles my head's hot you ain't gwine ter to mixin' up yo'se'f wid de riff-raff er creashun."

I am reminded here of a conversation had some years ago with the author of a beginner's Latin book. In a spirit of helpfulness I pointed out that the chapter in Latin participles could be understood only by one who already knew all about the Latin participles, and that Latin was difficult enough in itself without furnishing further obstructions in a lesson book. His answer was characteristic of the aristocratic ideal that objects to educating the "riff-raff er creashun":

"Here's just the trouble with you educational reformers," he said cheerfully, "you want to make things too easy for the pupils. Children must be interested—that is the modern cry; and what is it leading to? A lowering of the standard of education all along the line. The whole value of that chapter on participles is its difficulty; we put the screws on early to sift out the unfit. When I studied Latin," he went on, "it was no sugar-coated pill. It was a rough dose, but it did the business." No doubt it did the business for all except the few lucky survivors. Of course, there is no objection to a difficult Latin participle test, provided it were used solely to test a knowledge of Latin participles. Our quarrel is about the use of Latin participles on thirteen-year-old children as the sole password for any further education at all.

If the aim of the public high school is to turn out the largest percentage of perfect products, then every indolent, weak, ill-informed or slow-witted youngster lowers the average and should be got rid of. Such should go into the junk heap as imperfect parts of machinery. Every one sympathizes with such an aim in a medical school. There the greater the elimination of the unfit, the better will the community be served. The object of the college of medicine is not to assist some young person to get a better footing in life, but rather to discover and train the greatest medical efficiency. Dental schools, law schools, engineering schools have small excuse for keeping half-equipt students; and particularly is it incumbent upon training schools for teachers to hold a high and inflexible standard. We do not need to have Plato's authority for our belief that it is the business of pilots to pilot and of cobblers to cobble. Let us have no foolish tolerance in selecting those who serve us in occupations that directly affect the public weal. No license should be ever granted to blind engine drivers, to deaf bridge tenders, to unskilled physicians, to unsympathetic teachers, to dishonest bankers or to corrupt politicians.

But the object of the public high school is not primarily to turn out an example

of skill; its fundamental achievement is to bring our young people a step or two nearer efficient manhood and womanhood, to insure for the next generation a healthier, better-thinking citizenship, to give youth a better training for his later daily work; in short, to make intelligent beings a little more intelligent. This marks the great difference between the school and the mill, altho both institutions may operate looms.

Some high schools are managed like a track team instead of a gymnasium class. A good track team consists of record breakers, and only the possible point winners are taken care of; a good gymnasium class consists of all sorts and conditions of physical aptitude and inaptitude, and the weak are prescribed for with even more care than the strong. The chap that cannot jump six feet or run a hundred yards in eleven seconds, or hurl a shot so many meters is useless to a track team. Who would eliminate these fellows from the gymnasium hour or the period of organized play? The track team high schools have nothing but dismissal for those who do not qualify according to the arbitrary standard.

Every mother has a standard of health for the family toward which she is daily and nightly striving; but she doesn't asphyxiate all members that do not measure up. Otherwise, it would go hard with the babes in colic time. Indeed, it is the weaklings that receive the tenderest mother-care. Annihilation, we all remember, was Plato's scheme for the underweight babies of his Ideal Commonwealth, the highest standard of efficiency on record. Some of those present may thank fortune that ours is no Ideal Commonwealth. If we had any misconceptions along that line the recent party conventions have shattered them. As things are in this imperfect American commonwealth of ours, we must get along somehow or other with the sort of family that has been sent to us.

The new conception of public education is the bettering of all the children of all the people. Dropping from the rolls a large part of the difficult cases increases our ease, but, nowadays, it has begun to prick our consciences. The uneducated "riff-raff er creashun" go on living "in our midst" whether we as teachers are longer bothered by them or not. To cast them out because they do not come up to a Latin-Greek standard, or an algebra standard, or a modern language standard, or a college entrance standard, when all the while the children should have been measured by a manual training or a vocational standard, makes us indictable as bad judges of educational values, and particularly as bad judges of youth. We must take to heart Uncle Remus's plantation proverb that "Yo' can't handle no one-eyed mule on de blind side." So, obviously, our standard must rise and fall with the capabilities of our children; to this group it will be relatively high, to that group relatively low. If your high school becomes suddenly seven-eighths foreign born, as sometimes happens in the seaboard cities, your English teaching dare not remain aloof, but must come right down to the problem before it. If formerly you trained the sons and daughters of the professions, but now thru a change in the character in the neighborhood you draw from the toilers, your purely academic standard must show some understandable civic reason for remaining unchanged; and the community should not accept wholesale dismissals of pupils on the ground that they are not prepared to go forward. Our business is to do something with the sort of pupils we get. A discouraged Pennsylvania high school teacher complained to the superintendent, Henry Houch, "I can do nothing with this class. What do you do when your pupils come to you unprepared?" "What do I do!" exclaimed Henry Houch; "what do I do! I *teach* 'em!"

As high school teachers there is no particular virtue in holding a high standard if it results in cutting off all educational opportunity for the pupils that most need helpful guidance; nor is it wise for us to keep up a traditional curriculum if it has ceased to meet modern needs. We are diagnosticians of youth and the curriculum and the standard are but changeable means to an ever various end. We must, to be sure, discover that the child Roland who to our dark tower comes has not succeeded in algebra and plane geometry and make due report of the same; but our eyes must be open also to discover and make

use of his native skill in chemistry, in athletics, in languages, in debate, in school journalism, in the management and control of his fellows, in money-making avocations, or in the manipulation of wood and metal.

And more than this. We must be able to put blood into pale faces, to correct flat chests, to straighten crooked backs, to clear out the clogged throat and nose, to add lens to the eye as well as to calculate the number of imperfect subjunctives in the first three books of the Commentaries. And no matter how squad-like these multitudes march into our rooms, we must keep in mind that each child belongs to some mother or father who cares for it. We must remember, for we get hardened somehow, that it is a tremendously important thing to have a child in the high school getting his life career settled for him, and that to the little household the curt report of failure, without a word of suggestive help, has a damning finality too often carelessly unregarded by teachers. We should not feel satisfied in discovering only how far a pupil has fallen below the standard. That is to play the part of Alice's red-faced queen, shouting, "Off with his head! Off with his head!" "Off with his head!" is a thoroly unsocial attitude.

Every step in advance toward greater social and economic efficiency has seen a dropping of the standards. The achievement of free public education itself was a tremendous lowering of the standard; so was the 1776 declaration of equality of men before the law; so was the perpetration in American government of religious toleration; so were the slow grants of suffrage: to the upper middle classes of England (1832), to American negroes fresh from slavery (1865), to English workmen (1867), to British farm laborers (1884), to American women (any minute); so was the inclusion of the backward child in the scheme of education and the introduction of the work-bench for the academic incorrigibles. The growth of the belief in the brotherhood of man as against the ideal of a chosen people is a vast lowering of the standard Even Calvinism has succumbed to the almost inevitable broader movement; it has almost reversed its former stand of a democratic "fall" as an aristocratic "redemption." More folks are redeemable nowadays, even if the standard for the whole is not so high.

What steps in advance we have made! Time was when we whipped the weak witted because they did not come up to our standard, and filled their lives with daily and nightly horror of failure. Not so long ago we used to harry with demerit marks those who had no mind for book knowledge (that is, eye knowledge and ear knowledge), but had untold capacity for deviltry and hand knowledge. In the name of a high standard we used to keep feeble-minded chaps in the first grade at most unfitting tasks until they could no longer stand the mocking of their fellows. We used to force all pupils, sick or well, to the same number of hours a week, and do so yet in many places. We used to force all school children to sit for hours in silent rigidity, hands locked behind backs with long detentions for those who squirmed or "spoke," until school became hateful and the freedom of the factory a welcome release. We used to make no attempt to teach the deaf to hear, or the blind to understand, or the stammerer to speak, or the mentally twisted to think coherently, for no school with a decent respect for its standard would have anything to do with them.

The term "high standard" has two distinct uses which we must never confuse. Holding a high standard means maintaining a high ideal. Let us by all means keep the ideal for each young person at its highest, and strive to bring him nearer to it than he would ever have been had he not fortunately met us. The ideal for each person is the best that he is capable of doing. But let us not be forever shouting, "Off with his head!" when he does not do what we have arbitrarily decided he should be capable of doing. With all our twentieth century study of young folks we should have done with trying to feed fine, rich clover to impatient hunting dogs.

A high standard means a high ideal, but it means also the "dead-line." A prisoner that steps over the dead-line is instantly shot. A child that fails in spherical geometry and advanced French can have no further education from the

State. The live side of that dead-line has been heretofore mighty slim for children between the ages of twelve and seventeen. Let us widen it. American boys and girls should not have to wait until they are "sent up" to a reform school before they can get the sort of education that will bring the best out of them. Too many able youngsters are being shot down for stepping over the dead-line, and every educational life thus snuffed out is eventually a telling loss to the nation. Every individual is important in a democracy; and no standard of education paid for out of the common funds dare say that any group of individuals shall have no help or guidance.

It is our business, particularly in the high school, to help young people to a better adjustment to the life they must eventually live—all the young people that come to us. It is our business, which we cannot avoid, to fit the intellectual and social needs of all the varieties of boy and girl that find their way to our charge, and of thousands of others who we do not now attract at all. That is our high school program for the future, and it is not impossible. Says wise Uncle Remus, "Folks dunner w'at *bin* yit, let 'lone w'at *gwineter* be!"

Journalism for the College-Bred Girl

BY ELIZABETH McCRACKEN

[The successful experiences here reported are not at all exceptional. Journalism in some of its forms is a vocation to which women are peculiarly adapted by temperament, and a suitable college course, especially if designed to that end, affords a good preparation. All of the thirteen schools of journalism now in operation in this country admit women on the same terms as men, and the Columbia School of Journalism, to be opened next fall, will later make provision for both sexes.—EDITOR.]

I HAPPEN to live within five minutes' walk of one of the most famous women's colleges of our country; and, also, I happen to have a friend who is a Dean of Women in another; and, furthermore, I happen to have a relative who is a professor in another. I am frequently invited to visit all three of these colleges; and, at least once a year, and usually twice, I spend a few days at each of those two which are not in my town. As for the one that is within five minutes' walk of my home, scarcely a week passes that I do not find myself visiting it.

Thus, I see more college girls, and see them more often, and hear more discussion concerning them than do most persons. What they are doing in college; what they are going to do when they leave college; and, especially, for what work in the world their work in college is fitting them, are subjects few hear treated as constantly as I do. So many, so very many, professions are cited as being appropriate for the college-bred girl; ranging from teaching and settlement work, to housekeeping and home-making.

Among all these professions, I have almost never heard the profession of journalism mentioned.

"Journalism?" said a college professor dubiously, when I asked her one day why she had never thought of advising any of her students to enter that particular field. "It has never occurred to me! Do you believe a girl, with the academic habit of mind, could ever successfully do anything so unacademic as journalism?"

Since that time, two college girls whom I know have gone into journalism; and, in each case, have met with marked success. Their success, moreover, seems to be largely due to the very thing that my professorial friend felt might make for failure—the academic habit of mind.

One of the girls, hearing that the Woman's Page of the leading morning paper in the large Eastern city in which she lives had unexpectedly lost its editor, immediately called upon the manager and applied for the position. "I want to write for women," she said to the manager, "and here is a place in which to do it."

She had graduated from college only

two years before; she had never done any journalistic work. Her older and more sophisticated friends had warned her that the manager would smile; and he did. "What do you want to say to them?" he inquired. "What *could* you say to them on the Woman's Page of my paper? The Woman's Page is for housekeepers. You have never kept house; you couldn't have seen many women who did, in college. What have *you* got to say that belongs on a Woman's Page?"

"A Woman's Page ought to be for *women*," she replied. "*All* women are not housekeepers; and *no* housekeeper ought to be *merely* a housekeeper. Most housekeepers are interested in other things besides housekeeping, fortunately! I want to write for them about some of these other things."

After a little more talk, the manager agreed to allow her to assume charge of the Woman's Page for one month, without pay. At the end of the month he engaged her permanently, with a salary upon which, by being economical, she could be self-supporting. She has now had the page for eighteen months; and both the manager of the paper and her college regard the work she has done on it with approval and respect.

How did her collegiate training help her? In the first place, it had accustomed her to regular hours for work, and to punctuality in completing definite pieces of work. To do a certain amount of investigating, selecting and writing for her page, and to do it every day, required just the academic habit she had formed in college—of doing a certain amount of investigating and selecting and writing for her classes, and doing it every day.

The manager of the paper had said that she knew nothing of housekeeping. It was true that she knew little; but she did know how to find out from persons who were better informed, and from books things of which she was ignorant. She had learned that in college. So her page has on it those facts and hints and suggestions connected with housekeeping which housekeepers like to find on a Woman's Page; and it has, too, many things not appertaining to housekeeping, which housekeepers, as well as many women who are not housekeepers, are pleased to read.

"How many of us who never looked at the Woman's Page before turn to it now every morning!" a neighbor of mine exclaimed to me recently, glancing up from the page of my young friend.

When I urged her to tell me what, in her opinion, made the college-bred girl's page so interesting to so many diverse persons, she said, "It has such variety!"

The other college girl of my acquaintance who went into journalism is now a "society reporter"; that is to say, she supplies the society editor of one large paper and the society editors of two smaller papers in her city with bits of news about the comings and goings, the plans and projects of persons who, for one reason or another, are prominently before the world. She is considered a very valuable reporter; because, sometimes, she can get news that is not vouchsafed to any one who may ask for it; and she draws a good salary.

How does her collegiate training help her? She is a cultivated young woman, with pleasant manners and a well-informed mind. Her college made her that. Persons "in society" are for the most part cultured, refined and educated. This college-girl reporter has the same standards that they have. They understand her; and, knowing that they can trust to her taste and discretion in referring to them in the press, give her unusual opportunities for gleaning news items which society editors want.

A college education has helped these two girls to become successful journalists in their home cities. They have, by their work, won praise both for their colleges and for their papers. Why should not other college-bred girls do likewise?

CAMBRIDGE, MASS.

Turkey in War Time

BY REV. FRANCIS E. CLARK

[The president of United Society of Christian Endeavor made a tour of Turkey last spring and his observations on the internal conditions of the Ottoman Empire are peculiarly pertinent just now when "the dark cloud of civil war" to which he refers is more than threatening a storm and the "reactionary wave" is sweeping over the country.—EDITOR.]

FOR a country that is engaged in a serious armed conflict with a powerful nation, Turkey is today most quiet and apparently unconcerned. This is the more remarkable when we think of the traditional tho perhaps erroneous view of the average Turk, which pictures him as a bloodthirsty Bashi-Bazouk, whirling a double-edged sword and howling for vengeance upon his enemies.

I have recently spent more than two months in the empire of Turkey, traveling over nine-tenths of the railway mileage of which she boasts, and thru many sections entirely innocent of railways, and, except for Macedonia and one or two of the larger coast cities, I have found the country as peaceful and as peaceably inclined as old New England or our Western prairies.

Those of us who are old enough to remember the early days of our own Civil War, or even the excitement of that one-sided conflict, with its foregone conclusion, called the Spanish War, marvel all the more at the quietness and unconcern of Turkey in these days of national crisis. Who that lived in the days of '61 will ever forget those stirring times, the torchlight processions, the braying trumpets calling to arms, the great tents pitched in the public squares, where the recruiting officers were kept busy enlisting the eager youth, who literally tumbled over each other in their excitement and their desire to be first on the muster rolls! Who will ever forget the regiment starting for the front, the regiment of father or brother or husband perhaps, the regiment hailed with cheers as it marched down the long streets, while the soldiers were surfeited with gifts of food, and loaded with articles of comfort for camp and field!

If the traveler expects to see anything of this sort in Turkey today he will be very much disappointed, for he may journey for hundreds of miles thru the heart of the empire and rarely see a soldier, except the gendarmes at the railway stations; or hear the war with Italy mentioned, unless he asks some direct question concerning it. Then his inquiry will very likely be received with a shrug of the shoulders and a reference of the whole question to Allah and the fates.

Our journey took us from Salonica westward to Karaferia, the old Berœa, which is half way to Monastir, the head center of Albanian troubles; then eastward from Salonica to Constantinople, a twenty-four hours' journey by rail; from Constantinople across the Bosphorus, along the Sea of Marmora, for two long days of railway travel to Konia, in the heart of Asia Minor; then back to Smyrna, another two days' journey; up the Hermus Valley thru the old kingdoms of Lydia and Pergamos, and again up the valleys of the Meander and the Lycus to Laodicea, which is near the end of the railway line in this direction.

In all these regions, except Macedonia, we found the same apathy and apparent lack of interest in regard to the struggle which may have such a momentous influence upon the future of the Turkish Empire. The reasons for this quiet acquiescence in whatever fate may send are various. It is undoubtedly true that some, perhaps many, of the people of Turkey are as really indifferent to the war and its outcome as they seem to be.

There are many races in Turkey, and there is little love lost between them. It is doubtful if many Armenians would mourn greatly if Italy were victorious and the empire dismembered. The same might be said of many Greeks, and it is pretty certainly true of the Albanians, who feel that they have been deceived and ill treated by the Young Turks.

Again, the absence of newspapers with scare lines and thrilling details of the progress of the war, prevents the people from becoming inflamed by highly colored, exciting stories of victory or defeat. To be sure, there are daily papers published in two or three vernaculars in the large cities, and the comparative freedom allowed to the circulation of even opposition papers under the new Government, is in happy contrast with the absolute repression under the old regime. But these papers have a comparatively small circulation and do not penetrate far into the interior. Not every family in Turkey is excited to the boiling point at the breakfast table with the bloody story of the latest battle, as would be the case with us.

Moreover, other means of news-gathering and news-communication are slow and scanty, as compared with more advanced countries. The few railway trains in Asia Minor run only during the daytime, and a vast majority of Turkish towns and villages today can be reached only by the creaking araba, the ponderous camel or the humble ass. The telegraph stations, too, are few and far between. Even ancient Pergamos, where there is today a Turkish town of some 20,000 inhabitants, has no telegraph line, and a gentleman who wished to send an important message had to send it by a slow Turkish cart, which is able, at highest speed, to cover only three miles an hour, to a remote village, before it could be transmitted. At Konia, the ancient Iconium of St. Paul, tho there is a direct telegraph line to Smyrna and the coast some 300 miles distant, the telegraph operator would not undertake to have my message delivered in much less than two days.

All of these reasons account in part for the absence of excitement and the seeming lack of interest in the war. But the most important reason is the distance of Turkey from the center of the struggle. Tripoli is far away. It belongs to another continent. Its people are united with the mother country not by race or many common interests, except the interests of a common religion. It would be hard for the yellowest of our yellow journals to create any tremendous excitement about a conflict confined to the Philippine Islands, for instance, and it is still harder to arouse such an excitement in a country that has no yellow journals, and few of any other kind.

The Government of Turkey has accepted the situation philosophically. She has no effective fleet and she knows it. She could not now send troops to Tripoli, however much she might desire to do so, for the transports would soon be gobbled up by the ever-present Italian warships. But if Turkey has no fleet she has a splendid army, and she is quite as well aware of her strength in this particular as of her weakness on the sea. She knows that no modern Power would think of attacking her upon her own territory, and that the worst that can happen to her possessions in Asia Minor is the capture of a few coast islands or the bombardment of one or two cities.

When we come to Macedonia, however, we find, in the language of the day, "a different proposition." Here there is actual and imminent danger that peace may be disturbed at any moment. The Albanians are always hovering upon her northern border. The Balkan States, in a chronic condition of unrest, are not far away. Bulgaria, Servia, Rumania, all have ancient scores to settle with Turkey, and Austria and Russia are looking forward eagerly to the day when one or the other may extend their dominions to the shores of the Ægean, and open new lines for their restricted commerce.

For this reason the effective Turkish troops outside of Constantinople are centered largely in Macedonia. Every station is protected by a score of blue-coated Turks; every bridge and culvert has its guard for fear of an insurrectionary bomb. Sometimes on a railway bank one sees a hundred soldiers drawn up to protect a very innocent-looking piece of track, which apparently would be of no particular use to any enemy.

But that these precautions are not unwarranted or unnecessary is proved not only by the past history of Macedonian disturbances, but by more recent occurrences. The Bank of Salonika, at Monastir, was partially wrecked only a short time ago by an enemy's bomb. The day that we happened to be in old Berœa a Turkish policeman was murdered in cold blood by an Albanian, who, so far

as I could learn, was allowed to walk off unmolested, while the poor policeman expired in the baggage car of our train as we returned to Salonika. Thus the dark cloud of civil war always hangs over this part of the Sultan's dominions, and it is especially lowering when foreign war clouds also hang over another part of the empire.

I will not deny that after my recent months in Turkey, my sympathies are very sincerely with this threatened nation. Turkey has long been "the sick man of Europe," but the sick man has been convalescent of late; and for another nation to attack him in some vulnerable point when he is rising from his sick bed is like attacking an invalid who is slowly recovering from a long siege of tuberculosis. I know what there is to be said for Italy, and the temptation that is hers to seize Tripoli while the other nations bordering the Mediterranean are dividing the coast of Africa between them. Nevertheless the war seems to me utterly unjust and unjustifiable, and the restraint which the Turks have so far imposed upon themselves is altogether admirable.

Young Turkey is not old Turkey. Marvelous advances have been made since the independence day of July, 1908. The reforms, the liberality of the present constitution, the courtesy of the modern Turkish officials, can only be appreciated by one who traveled in Turkey under the old regime and again in these later days. Then every traveler was an object of suspicion. Every stranger was looked upon as a possible enemy of the country. Every obstacle was put in his way short of imprisonment and murder. The custom houses were the worst in the world. Not a book or a scrap of printed or written matter was likely to pass the Argus-eyed inspector, lest perchance it might contain something derogatory to the Sultan or his dominions.

Suspicions of the author and the scribe were carried to most absurd lengths. A book about Turkey, consigned to the celebrated Dr. Long, was burned because there were some reflections on a former dynasty. "Do you know what a hole would be made in the world's literature if every book derogatory were burned?" said Dr. Long to the censor.

A geography was tabooed because it spoke of the union of the waters where the Bosphorus joined the Ægean, and the censors thought that this might be some hidden allusion hostile to Turkey. The Epistle to the Galatians was forbidden, it is said, and the police sought to arrest the author, because they thought he had written an incendiary letter to the people of Galata, a part of Constantinople.

I was solemnly warned on this former journey across Asia Minor that such words as "fellowship," "brotherhood," "society," "union," "Christian endeavor" must not be used in any address I might make, on pain of imprisonment or worse. On this recent journey everything was changed. The examination of our baggage was merely nominal. Some of our trunks were admitted without even being unstrapped.

To enter Constantinople or Smyrna or Salonika is a much less serious ordeal, so far as the custom house is concerned, than to land at New York or San Francisco. One is at liberty to take any books or papers or written documents that he chooses. Papers and magazines from foreign countries, which were formerly liberally adorned with lampblack wherever a suspicious paragraph appeared, are now admitted freely to any part of the empire.

We found the officials uniformly polite and courteous, and after crossing the Bosphorus into Asia Minor were not asked, on a single occasion, for our passports.

With all the sins and shortcomings that may be laid at the door of the Young Turks, it must be admitted that they have brought about some notable reforms. The well-known banishment of the dogs of Constantinople should be laid to their credit, and for this alone they will receive the blessing of every traveler. One hundred and sixty-seven thousand of these mangy curs were transported to one of the islands in the harbor, and for a while at least were fed at the expense of the city. What has become of them now deponent saith not.

The quiet imprisonment and safekeeping of the old murderous Sultan is

another thing to thank the Young Turks for. I was rejoiced to see his prison villa in Salonika, guarded by hundreds of soldiers—narrow quarters for a man with such a family, tho he was allowed to bring only seven wives with him from Constantinople.

There are laudable efforts being made, too, to mend the roads of Turkey, some of which have not been touched since the days of the Romans. In many places one sees stone-breakers at work on huge piles of stone by the wayside. Tho these commendable efforts so far have succeeded chiefly in making the roads a little more impassable than they were before, they at least give promise of better things for future travelers over Turkey's highways.

There is no doubt that, unfortunately, a reactionary wave has set in in Turkey. The Young Turks found that they were not carrying the old Mohammedans with them in their zeal for reform. They feared that the conservative forces would win the day and deprive them of power, and it is no doubt true that, especially in their treatment of the subject races of their own country, they have taken some backward steps. They have learned an ill lesson from Russia and Germany, and have attempted the impossible, namely, to make Turks of the Armenians, Greeks, Albanians and Wallachs, as Russia has attempted to Russianize and Germany to Germanize their conquered provinces. This seems to me a very serious if not a fatal mistake, for constant irritation and disturbance within their own boundaries is thus promoted. We can only hope that before it is too late the Young Turks will see the error of their ways, and again pursue a more liberal policy.

Already another progressive if not an insurgent party has arisen, pledged to carry out the reforms which the older Young Turks first blazoned on their banners, and this new party, which is conducting an active propaganda, will doubtless have a wholesome effect upon those that now hold the reins of power.

There are other clouds in Turkey's sky besides those that overshadow Tripoli and Macedonia. Affairs in Crete are still acute. Says the *Orient*, an important English paper published by the missionaries of Constantinople:

> "The Cretans have turned a deaf ear to the advice of Greece and of Mr. Venizelos, the noblest Cretan of them all, as well as of the other powers. . . . The members of the Constituent Assembly, lately established by the people, have sworn allegiance to King George of Greece and have elected sixty-nine deputies to represent Crete in the national assembly in Athens. Should Greece allow a single Cretan deputy to take a seat in her assembly, the Ottoman troops would cross the Thessalian frontier, and may the Lord preserve us from a step of such international danger!"

I would close this article with a hopeful note by reminding my readers of a most remarkable sign of Turkish progress, and that is the self-restraint shown by the people, rulers and ruled alike, in the present crisis. It is altogether admirable and scarce to be expected. In the city of Smyrna alone are ten thousand Italian subjects, besides tens of thousands more in other parts of the empire. Up to this time scarcely one of these subjects of a hostile Power that has forced a disastrous war upon Turkey has been molested in his business or his home life, tho there are rumors that certain classes of Italians will be expelled.

The harbors of Smyrna and Salonica have been mined to protect the cities against the Italian ironclads, which are constantly expected. For days before our departure from the former city a fresh crop of rumors every morning disturbed its serenity by assuring the citizens that their homes were to be bombarded that very day. The island forts of the neighborhood have been shelled and occupied by Italian troops, and yet the Italians in Smyrna and elsewhere have been allowed to buy and sell and get gain, to engage in their trade, to walk the streets unharmed and unthreatened.

If a foreign Power should threaten a seaport of America, should bombard our forts and fill us with constant anxiety, would the subjects of that Power be treated as well as the Ottomans have treated the Italians? Let us no longer call them "the unspeakable Turks."

BOSTON, MASS.

Money and the Cost of Living

BY ROBERT LUCE

[This article on the question now uppermost in the public mind is by an authority on the subject, the Lieutenant-Governor of Massachusetts and recently the chairman of the Commission on Cost of Living.—EDITOR.]

SIXTEEN years ago the voters of the United States decided a Presidential election on a question of money. Mr. Bryan lost on the contention that there was not enough money for the needs of the country and that silver should be restored to its old place in the currency. The bitter partisan controversies of the time brought into disfavor in certain quarters an axiom of economics that, other things being equal, the value of money varies inversely as its quantity. This, the quantity theory of money, was derided by some, denied by others. Yet as a broad, basic principle it is, it must be, true.

It was most fortunate for the country and for the world that Mr. Bryan's application of the principle did not prevail. Without it the stock of money has increased enormously. Had silver also played a part, the phenomena of the times would have been even more startling.

In the sixteen years that have passed the world's stock of gold has been increased by one-half. It has doubled in thirty years. The estimated amount of coin and paper money in circulation in the United States has almost doubled; of individual bank deposits subject to check, sometimes called deposit currency, has nearly trebled.

When the supply of any other commodity than money increases, everybody expects its value in exchange will fall unless the demand for it keeps pace with the supply. Somehow it is not so easy to understand that the value of money in exchange will fall if its supply increases faster than the demand for it. Yet there is no difference between money and any other commodity.

The demand for money—that is, the need of it to do money work—depends on the volume of trade. Professor Fisher's careful estimate is that the volume of trade in the United States about doubled from 1896 to 1910. He has also computed the changes in the velocity of circulation of money and checks, for in measuring the work of a machine we must take into account not only the output but also the speed. He finds that there have been slight increases in velocities of circulation, but they do not materially affect the general result, which is that, because of a doubling of money and a trebling of deposits from 1896 to 1910, wholesale prices increased by nearly three-quarters, in spite of a doubling in the volume of trade.

To recognize the effect of increased gold production on prices is not new. Many writers have shown the results of the discoveries of gold in California and Australia sixty years ago. The effect of an inflated paper currency has been well understood since the times of John Law, and to rehearse what happened in the days of the American Revolution, the French Revolution and our Civil War would be to retell an old story. The effect of the development of bank checks is not so generally understood, doubtless because it is so recent and novel. In the earlier period of American banking individual deposits did not play an important part. Loans were taken out in bank notes rather than in the use of credit against which checks could be drawn. About 1840 there began an increase in deposits. In New York, from 1840 to 1860, they grew more than seven-fold. In 1859 the New York bank superintendent reported that the business of the country had ceased in a very considerable degree to be transacted thru the medium of bank notes; bank accounts had come into general use. Within ten years the number of depositors had increased twenty times. Since then the habit has spread amazingly. In the last thirty years the individual deposits subject to check in the banking institutions of the United States have increased

ten-fold, while the population has increased less than two-fold. They now amount to more than ten billion of dollars. In 1896 about 14 per cent. of our business was performed by what we commonly call money, 86 per cent. by checks; in 1910 about 8 per cent. by money, 92 per cent. by checks. In other words, less than one-tenth of the business of the country is today performed by what is commonly called money, more than nine-tenths by a form of currency that was almost unknown when the oldest banker now living in the United States was a youth.

We are beginning to see that a modern bank is a mint which coins into dollars the capacity of men to pay debts. It makes currency out of carpets, bricks, rails, shoes, every form of merchandise, buildings, or any other kind of wealth against which bank credit is given. Even the good intentions of two or three men who will put their names on a piece of paper called a note, presently are paying grocery bills, doing the work that a century ago was done only by gold, silver, or the fiat money of a government.

Sundry writers have denied that checks are money. They say that the use of checks is in the nature of barter. Yet if this new currency had not been devised and if no other substitute for coin had appeared, it seems clear that the demand for gold to do the business of today would have been enormously greater, making its value correspondingly higher. In other words, prices would have been far lower, for to say that the value of money is high is simply another way of saying that prices are low. A general fall of prices is a rise in money. They are two ways of saying the same thing. Price is nothing but the measure of the value of other commodities in terms of money.

Without quibbling over the definition of money, the plain fact is that we have had an enormous increase in things that do the work of money. Since 1896 in individual deposits subject to check the United States alone has averaged an increase of about $325,000,000 a year. We have surpassed all other countries in this matter, but taking the world thru it is not impossible that the total increase in deposit currency has equaled the annual increase in the world's stock of gold—now something under $500,000,000 a year.

That this increase in money and things which do the work of money, together amounting to perhaps a billion dollars a year, has far exceeded the growth in demand due to increase in the world's trade, resulting in a general fall in the value of money, that is, in a general rise of prices, world-wide in extent, seems beyond dispute. From every quarter of the globe come complaints of the increased cost of living. Only a world-wide cause can produce a worldwide effect, and there appears no other world-wide cause save this.

Never has there been so great a change in the standard of value over all the world, in so short a time. Never have the evils of a fluctuating standard of value been made so apparent. Huge have been the undeserved losses by some, huge the unearned gains by others. To illustrate, note what has happened to depositors in savings banks. The man who deposited $100 in 1896 in a bank paying 3½ per cent. compounded semiannually drew out in 1910 less in purchasing power than he had invested, on the basis of wholesale prices. He had progressed backward. Professor Norton has estimated that this has meant a loss of more than a thousand million dollars to the savings bank depositors of this country alone in the last fifteen years. Every lender of money, every mortgagee, every bondholder, has lost in the same way. Leaving individual losses out of account, what must have been the damage to the endowments of our educational and charitable institutions, to the resources of our insurance companies!

The cost of living—that is, the outlay of the mass of our people for food, clothing, shelter, and the usual expenses of common life—follows retail rather than wholesale prices, and in the last fifteen years has risen by about one-quarter. Only a few have seen their incomes rise in equal ratio. Particularly hard has this been on those whose incomes are virtually fixed by custom or necessity — clergymen, physicians, editors, teachers, judges, public officials, many classes of salary or wage earners, as well as those who by reason of infirmity, age

or sex—the invalid, the orphan, the widow—are dependent on dividends or income.
